Cmt No.	Page No./ Section No.	MPCA Comment:	*	Ford Company Response/Comment
General Comment	Not Applicable	Although the Report includes much soil and groundwater data that helps advance the environmental investigation at the Site, the evaluation of that data is largely limited to exceedances of Industrial Soil Reference Values (SRVs) and Health Risk Limits (HRLs), respectively. The need for a more in-depth evaluation and presentation of data collected at the Site has been discussed with Ford and Arcadis in the past. We recognize that project staff at both companies has since changed, so we see this [letter] as an opportunity to reaffirm the MPCA's criteria for the current and future environmental reports submitted for the Site.	**A**	Ford recognizes and agrees with the need for a more in-depth evaluation and presentation of collected data and has revised this report accordingly and will continue to meet this need in future investigation reports.
General Comment	1	Please revise and resubmit the Report in accordance with the comments listed below. MPCA staff may have follow-up comments after reviewing the revised report, as the omission and/or presentation of some items somewhat hindered our review.	**A**	A revised report is attached.
1	Figure 2 and 3	The scale of Figures 2 and 3 does not foster comprehension of the data: the information is cramped and the font size too small. While it is desirable to have site-wide figures showing a cumulative presentation of soil and groundwater data, respectively, the figures should be printed on either a larger scale plan-size sheet or multiple 11 by 17 inch sheets for a site of this acreage.	**A**	Figures 2 and 3 have been removed. In accordance with the recognized need for a more in-depth evaluation and presentation of data as well as potential future investigation needs, the Site has been subdivided into 11 Focus Areas. These Focus Areas have been incorporated in the presentation of the data collected-to-date, with individual figures illustrating investigation results by each area. Future reports will also incorporate this division of the Site to foster continuity and comprehension.

Cmt. No.	Page No./ Section No.	MPCA Comment:	*	Ford Company Response/Comments
2	Figure 2 and 3	Additional larger-scale figures should be provided showing areas of concern (AOCs) and related sample locations and contaminant data. The scale and aerial extent of these supporting figures should be based on feature locations (or a group of feature locations) and the ability to show the relevant site features assumed to be the sources of contamination. Each of these figures should also be a cumulative presentation of sample locations/data.	**A**	See response to comment 1.
3	Figure 2 and 3	For the figures discussed above, consider using color-coding to distinguish between soil sample locations which meet or exceed risk-based screening values. For example, a green dot could represent a soil sample location that meets Residential SRVs; an orange dot a sample location that meets Industrial SRVs, and a red dot a sample location which exceeds Industrial SRVs. The visual impact of such a presentation will more efficiently convey the extent and magnitude of soil contamination as it pertains to different types of property use.	**A**	See response to comment 1. Newly developed figures incorporate a distinction between sample locations based on type of exceedance.
4	Figure 3	Please check the screened intervals for MW-5 and MW-6 (by the former solvent UST basin), as presented on Figure 3. These are shallow monitoring wells which are screened in the unconsolidated deposits overlying bedrock, thus the listed screened intervals may be incorrect.	**A**	The figure depicting this area has been revised accordingly (interval depths: MW-5 [4.3-6.3 ft bgs], MW-6 [4.4-6.4 ft bgs]).
5	Table 6/ Figure 2/ Figure 3	Carcinogenic PAHs should be discussed and evaluated in terms of the calculated benzo(a)pyrene (BaP) equivalent. All data tables which present PAH data should include the calculated BaP equivalent as well as individual PAH concentrations. Figures showing SRV exceedances should use the calculated BaP equivalent of soil samples, not the individual benzo(a)pyrene concentration.	**A**	Data Table 6, which presents PAH data, has been revised to include the calculated BaP equivalent as well as the individual PAH concentrations, if applicable. Figures have been revised to show calculated BaP equivalent exceedances, not individual benzo(a)pyrene concentrations.
6	Table 6	Please make the following revisions to Table 6 *(Summary of Detected Constituents in Soil):* • In addition to the feature number, include the name of the feature (or an abbreviated version of the name) in the table heading.	**A**	• Feature names were added in the table heading for corresponding feature numbers. Focus Areas were also added in the table heading.

CODE: A=Agree D=Disagree W=Withdrawn E=Exception Noted NA=Not Applicable

Cmt. No.	Page No./ Section No.	MPCA Comment:	*	Ford Company Response/Comments
		• All soil data and SRVs should be presented in milligrams per kilogram (except for Toxicity Characteristic Leaching Procedure data).	**A**	• All soil data and SRVs were edited to be presented as milligrams per kilogram. Future reports will also incorporate this presentation request.
		• It would be helpful to split Table 6 into two parts: Table 6A for features/data located east of Mississippi River Boulevard, and Table 6B for features/data located west of the boulevard.	**A**	• The table has been revised to illustrate data collected within 11 Focus Areas. Focus Areas 10 and 11 (Group B) are west of Mississippi River Boulevard, while the remaining Focus Areas are east of Mississippi River Boulevard (Group A).
		• Table 6A: References to Recreational SRVs can be deleted. To make the detected · constituents easier to discern, use boldface for detected constituents, shading for concentrations that exceed Residential SRVs, and a box for concentrations that exceed Industrial SRVs (or different color shading for exceedances of Residential vs. Industrial SRVs).	**A**	• The table has been revised such that Focus Areas located east of Mississippi River Boulevard (Group A) only reference Residential and Industrial SRVs; the presentation of data has been revised in agreement with the format stipulated by the MPCA for detected constituents based on SRV exceeded.
		• Table 6B: References to Residential SRVs can be deleted. Highlight detections and exceedances as noted above, with data compared to Recreational and Industrial SRVs.	**A**	• Focus Areas 10 and 11 (Group B), located west of Mississippi River Boulevard, will reference Recreational and Industrial SRVs, and will follow the format stipulated by the MPCA for detected constituents based on SRV exceeded.
7		Please make the following revisions to Table 7 *(Summary of Detected Constituents in Groundwater):*		
		• In addition to the feature number, include the name of the feature (or an abbreviated version of the name) in the table heading.	**A**	• Feature names were added in the table heading for corresponding feature numbers. Focus Areas were also added to the table heading.
		• To make the detected constituents easier to discern, use boldface for detected constituents and shading or box to highlight exceedances of screening values. For this Site,	**A**	• Table 7 has been revised in agreement with the format stipulated by the MPCA for detected constituents based on SRV exceeded. EPA's MCL screening values has

CODE: A=Agree D=Disagree W=Withdrawn E=Exception Noted NA=Not Applicable

Cmt. No.	Page No./ Section No.	MPCA Comment:	*	Ford Company Response/Comments
		EPA's MCL is a useful frame of reference only for arsenic. The table could be simplified by deleting the MCL column, changing the title of the next column to "Screening Value", and indicating EPA MCL as the basis for the arsenic screening value. For this Site, the MPCA does not need exceedances of EPA's MCLs to be highlighted.		been removed for all constituents except arsenic.
8		Formal soil boring logs must be prepared for every soil boring, in addition to the field notes provided in Appendix A.	**A**	Formal boring logs have been developed and are provided in Appendix A.
9		Include a figure depicting depth to bedrock at the Site.	**A**	Geologic cross-sections have been developed to depict depth to bedrock at the Site.
10		Include representative geologic cross-sections of the Site.	**A**	Geologic cross-sections have been developed and are provided as Figures 20 through 23.
11		The reference at the bottom of page 4 to a "historical structure with unknown use" appears to refer to the former manufactured gas plant. If this is indeed correct, please update the text accordingly.	**A**	The text has been revised appropriately.
12		The text of the report should address in a broader fashion the type and concentrations of contaminants that are present within the various AOCs and not be limited to analytes that exceeded Industrial SRVs or HRLs. While exceedances of Industrial SRVs may eventually drive Ford's risk-based soil cleanup activities, at this stage of the project, the goal is to define and understand the full range of contamination that may be present at the Site. For example, if chlorinated VOCs were detected in soil, the text should mention this, even if the concentrations were less than SRVs.	**A**	The text of the report has been revised to address all detections of analytes on Site, even if the concentrations were less than SRVs, to facilitate a full range definition of contamination that may be present at the Site. In addition, concentrated areas have been defined by Focus Areas to alleviate current and future discussions related to TCAP.
13		The soil samples from Feature 9 (Former Disposal Area A) and Feature 11 (Former Disposal Area B) were not sampled for SVOCs as requested in the March 15, 2010, Work Plan Approval letter from the MPCA. In addition, the approval letter requested a soil sample from within the upper four feet at each location. Please include these samples/analyses in a future scope of work.	**A**	The future scope of work will make sure to include the requested samples/analyses.

CODE: A=Agree D=Disagree W=Withdrawn E=Exception Noted NA=Not Applicable

Cmt. No.	Page No./ Section No.	MPCA Comment:	*	Ford Company Response/Comments
14		In the pending work plan, include a proposal to resume sampling of the monitoring well network at the Site. In addition to the monitoring wells installed by Arcadis, include monitoring wells MW-4, MW-5, and MW-6 (former Bulk Storage and Waste Solvent USTs area) in the site-wide sampling plan.	**E**	Monitoring of existing wells will be addressed in future work plans and has not been included in this revised investigation report.
15		Discuss the hydraulic connection between the Site and Hidden Falls Creek. The discussion should include information regarding the storm sewer that connects to the Outfall (depth, construction, elevation of storm sewer relative to shallow perched groundwater, etc.) and the potential that the storm sewer provides a conduit for the migration of contaminated perched groundwater from the Site to Hidden Falls Creek. Please clarify whether this storm sewer is to be removed during the upcoming site demolition.	**A**	The text has been revised to address hydraulic connection of utilities with potential to serve as conduits for contaminant migration (e.g. tunnels) as well as the requested storm sewer.

Supplemental Phase II - Exterior Investigation Report (Revised)

Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

Executive Summary

On behalf of Ford Motor Company (Ford), ARCADIS U.S., Inc. (ARCADIS) is submitting this Supplemental Phase II Exterior Investigation Report (Report) to the Minnesota Pollution Control Agency (MPCA) to document the findings associated with subsurface investigation activities completed to evaluate Features identified during the Phase I and the Initial Phase II - Exterior Investigation at the Ford Twin Cities Assembly Plant (TCAP). The scope of the supplemental exterior investigation was approved by the MPCA on March 15, 2010 and consisted of completing soil borings, installation of permanent and temporary monitoring wells, and soil and groundwater sampling corresponding to identified Features within 9 of 11 Focus Areas (FAs). FA-3 and FA-8 were not included in the approved scope of the investigation; FA-3 (Main Assembly Plant) investigation activities were completed under a separate work plan and FA-8 (Baseball Fields) was addressed in 2008 and reported in the Response Action Implementation Report – Baseball Fields – Feature 139 (ARCADIS 2008a). Additionally, although FA-10 (Area C) was included in these activities, results were reported under separate cover to the MPCA in the May 2013 Draft-Final Area C – Comprehensive Site History and Investigation Report.

A total of 86 direct push soil borings, 10 temporary wells and 8 permanent wells were completed to investigate 26 Features for soil and groundwater impacts from August to November 2011 and October 2012. Three Features (No. 23, 49, and 121) were not investigated due to utility interference or other obstructions. Investigation results, including analytical and geological data, were reviewed to determine type and extent of contamination within each FA. Furthermore, analytical results were compared to MPCA Soil Reference Values (SRVs) or groundwater Health Risk Limits (HRLs) to identify areas of exceedances within each FA. A summary of findings is provided below.

Focus Area	Highest SRV Exceedance	HRL/MCL Exceedances	Analytes
1 - North Parking Lot Area	Industrial	Yes	VOCs, Metals
2 - Open LUST Releases	Industrial	Yes	VOCs, SVOCs, Metals
4 - Former Hazardous Waste Storage Areas	Industrial	Yes	VOCs, SVOCs, Metals
5 - Paint Shop	Not Applicable	Yes	SVOCs, Metals
6 - Former Hazardous Waste Storage and Disposal Areas	Industrial	Yes	VOCs, Metals
7 - Railroad Tracks	Industrial	Yes	VOCs, SVOCs, Metals
9 - Main Assembly Building (Specific to Residential Cleanup)	Not Applicable	Yes	Metals
11 - Wastewater Treatment Plant	Industrial	Yes	SVOCs, Metals

1. Introduction

This Supplemental Phase II Exterior Investigation (SEI) was conducted by ARCADIS on behalf of Ford for the Twin Cities Assembly Plant (Site). The SEI was conducted in accordance with the Supplemental Phase II – Exterior Investigation Work Plan (SEIWP) and North Parking Area addendum, submitted to the MPCA on May 13, 2008 and May 19, 2008, respectively (ARCADIS 2008a and 2008b). The supplemental work plan and addendum were approved by the MPCA on March 15, 2010 and July 8, 2009 respectively.

The SEI was conducted between August and November 2011and October 2012 to provide delineation of impacts that were observed during the Initial Phase II Exterior Investigation and to investigate Features identified during the 2007 Phase I Environmental Site Assessment (ESA) (ARCADIS 2007a) not addressed during the initial mobilization. A detailed summary of each Feature, its corresponding borings, and the Feature-specific analytical parameters are included in Table 1.

The scope of services performed by ARCADIS during the SEI included:

- Utility clearances activities were completed prior to initiating subsurface work and consisted of a public utility locate, private utility locate, and review of Ford utility drawings. All boring locations were also manually cleared using a hand auger or hydro-vacuum to a depth of five feet below ground surface (bgs).

- Eighty-six soil borings (ASB-115 through ASB-148, ASB-157 through ASB-200, and ASB-254 through ASB-261) were completed to further evaluate identified Features using a direct push Geoprobe® drill rig. Soil borings were logged by an ARCADIS geologist using the United Soil Classification System (USCS) and field screened using a photo-ionization detector (PID). Up to three soil samples were collected from each soil boring and submitted for laboratory analysis.

- Ten temporary monitoring wells were installed and groundwater samples collected for laboratory analysis. All soil borings and temporary wells were abandoned in accordance with Minnesota Department of Health (MDH) regulations upon completion of sample collection.

- Eight permanent groundwater monitoring wells were installed in the unconsolidated materials above bedrock using a hollow stem auger to evaluate groundwater quality. The wells were installed, developed and sampled consistent with the

methodologies described in the SEIWP and addendum (ARCADIS 2008a and 2008b).

- All monitoring well and soil boring locations were surveyed by Sunde Land Surveyors.
- Soils, drilling water, and monitoring well purge and development water were analyzed and characterized as investigative-derived waste (IDW) for disposal.

2. Site Background

This section provides a description of the Site, a summary of the site history, and a description of the site geology and hydrogeology.

2.1 Property Location and Description

The Site is located at 966 South Mississippi River Boulevard in St. Paul, Ramsey County, Minnesota at approximate Latitude (north) 44^{o} 54' 50.8" and Longitude (west) 93^{o} 11' 31.9". The Site is located in a mixed industrial, commercial and residential use area on the eastern shore of the Mississippi River, along the east side of South Mississippi River Boulevard, south of Ford Parkway and west of South Cleveland Avenue. The Site is accessed from the west via two entrances on South Mississippi River Boulevard and from the north via three entrances on Ford Parkway. The property location and layout are depicted on Figure 1. With consideration of former Site operations, construction, geographical layout, and environmental activities completed to date, the Site has been divided into 11 FAs as depicted on Figure 2.

Operations at the Site formerly consisted of the assembly and painting of light duty trucks (Ford Ranger) using parts manufactured off-Site. Assembly processes included welding, metal cleaning, painting and curing, windshield and trim installation and preparation of the vehicles for final delivery. In addition, a wastewater treatment plant and steam plant are still in operation at the Site and were associated with the former assembly operations, which were all investigated during the Phase I ESA. Manufacturing operations at the Site ceased on December 16, 2011.

2.2 Site History

The Site was vacant undeveloped land prior to construction of the assembly plant. Construction of the original portion of the main assembly building (MAB) began in 1923 and several additions to the MAB have occurred throughout the years, mainly between 1960 and 1978, which added 300,000 square feet to the original building footprint. The paint building was constructed in 1985 and is connected to the MAB via a 625-foot bridge. The steam plant was constructed in 1923 and is approximately 10,400 square feet. A former coal gasification plant was located near the southeastern corner of the steam plant, but was demolished prior to 1974. The wastewater treatment plant is located adjacent to the steam plant, and was constructed in 1984. Additional details on the history of the Site are available in the Phase I ESA (ARCADIS 2007a).

2.3 Site Geology and Hydrogeology

The general geology and hydrogeology of the Site, based on information identified during the Phase I ESA (ARCADIS 2007a), and initial and supplemental exterior investigations, is outlined in the following sections. Data collected to date was also utilized to developed representative geologic cross-sections traversing the Site. The site-wide cross section location map is provided as Figure 3.

2.3.1 Geology

At the surface of the Site, a thin mantle of unconsolidated sediments exists over bedrock terraces. Underlying the unconsolidated material are sedimentary bedrock units that were deposited during the middle of the Ordovician geologic period. The sedimentary units are, in descending order, Decorah Shale, Platteville Limestone/Dolostone, Glenwood Shale, and St. Peter Sandstone. The depth and thicknesses of the bedrock units, as interpreted from boring logs, are illustrated on the geologic cross-sections (Figures 4 through 7)

Overburden: The soil mantle consists of predominately sandy clay and clayey sand. Weathered shale cobbles are common and two to five feet of peat was observed east of the former oil fill area (Feature 20). Near former disposal Area B (Feature 11) and former waste disposal area at the wastewater treatment facility (Feature 140), much of the native material has been disturbed and is mixed with fill material such as building rubble, glass, and scrap metal.

Bedrock: The Platteville formation lies on top of the Glenwood Shale formation and the contact appears to be gradational. The Glenwood Shale is composed of dark green to gray shale and sandy shale. The formation is thinly laminated and moderately fissile (cleavable) and is approximately seven feet thick in the areas investigated. The St. Peter Sandstone outcrops along the bluffs of the Mississippi River and continues below the elevation of the riverbed. The sandstone is composed of medium-grained, well-sorted and well-rounded quartzite. It is white to buff in color and is medium to weakly indurated (hardened). The St. Peter formation is as much as 150 feet thick in the Twin Cities area.

2.3.2 Hydrogeology

Perched groundwater is found in the highly heterogeneous unconsolidated sediments overlying bedrock. Bedrock groundwater is encountered in the St. Peter formation,

which is a high yielding aquifer. Groundwater in the overburden is generally isolated from the bedrock groundwater by the Decorah/Platteville/Glenwood Formation, which has been documented to be an aquitard/aquiclude.

The apparent groundwater flow direction at the Site is generally to the southwest towards the Mississippi River. However, based on Site-wide monitoring well data, groundwater flow can be locally variable particularly in the unconsolidated sediments and close to the river.

The potential hydraulic connection between the Site and Hidden Falls Creek was reviewed to evaluate the potential of Site utilities (storm sewer and subsurface tunnels) providing a conduit for the migration of perched groundwater. Outfall 001, which discharges to Hidden Falls Regional Park, collects storm water from the east side of the Site (including the paint building and railroad tracks) prior to combining with storm water received from neighboring properties. Overburden groundwater was not encountered within the eastern portion of the Site, demonstrating the possibility that overburden groundwater does not migrate to Hidden Falls Creek through the storm water sewer to Outfall 001. The subsurface tunnels at the Site, which generally extend linearly from east to west, terminate within the Site property limits west of Mississippi Boulevard and do not provide potential for direct contact with off-site receptors. The tunnels terminate more than 50 feet below ground surface (bgs) (711 feet above mean sea level) as noted in the ARCADIS 2009 Tunnel Survey Report. This elevation is well below the overburden groundwater depths observed east of the Mississippi Boulevard and above those observed west of the Mississippi Boulevard.

Additional information on the geology and hydrogeology of the Site can be found in the Phase I ESA (ARCADIS 2007a) and the Initial Phase II – Exterior Investigation Report (ARCADIS 2007b).

2.4 Previous Investigations

Several site investigations and reports have been completed for the Site. The following is a brief summary of previous investigations.

On June 26, 1990 the MPCA issued a Request for Response Action (RFRA) due to the historical waste handling and disposal practices at the Site. In accordance with the RFRA, a Remedial Investigation/Feasibility Study (RI/FS) was completed in May 1992 by Conestoga-Rovers & Associates Inc. (CRA), which included a Remedial Investigation/Alternatives Analysis (RI/AA) of three areas adjacent to the paint building and MAB (Area A, Area B and a UST site) designated by the MPCA (CRA 1992).

A Phase I ESA was completed by ARCADIS in 2007 to identify Features and obtain information regarding environmental activities and conditions at the Site (ARCADIS 2007a).

A soil investigation was completed in 2007 to evaluate the Potential Battery Waste Disposal Area (Feature 139), located east of the plant in FA-8 (Baseball Fields). Based on the results of the initial soil investigation, an Additional Soil Investigation and Surface Soil Risk Assessment was completed in 2007. Following this additional soil investigation, Ford completed response activities and submitted a Response Action Implementation Report – Baseball Fields – Feature 139 to the MPCA in March 2008.

An Initial Exterior Phase II Investigation was completed in June and July 2007 and the Initial Phase II – Exterior Investigation Report was submitted to the MPCA in October 2007 (ARCADIS 2007d).

An Initial Interior Phase II Investigation was completed in August 2010. No report summarizing these findings has been submitted to date. Additional interior investigation activities are scheduled for 2014 following demolition of Site buildings.

3. Supplemental Phase II Exterior Investigation Methodologies

The following sections detail the methodologies utilized to complete the defined scope of work. Any deviations from the approved work plan and comments received from the MPCA are noted.

3.1 Field Methodology

3.1.1 Utility Clearance

Utility clearance activities were completed prior to initiating subsurface work and consisted of a public utility locate, private utility locate, and review of Ford utility drawings. Gopher One Call was notified to mark all public utility lines servicing the Site. Additionally, Hance Utility Service, Inc. of Buffalo, Minnesota was retained to locate private utilities in the area of subsurface work. Finally, a surface inspection was completed with Ford personnel using available utility maps for each specific boring location. After removing any surficial debris (i.e., asphalt or concrete), a hand auger or hydro-vacuum unit was used to excavate the top five feet bgs and manually clear the area.

3.1.2 Soil Borings and Temporary Wells

Eighty-six soil borings (ASB-115 through ASB-200, ASB-254 through ASB-261) were completed using a direct push Geoprobe® rig. Each boring was logged continuously by an ARCADIS field geologist and screened using a PID with an 11.7 electron volt (eV) lamp. A summary of all PID readings collected in the field is available in Table 2. Soil boring logs were created in the field and all soils were classified using the USCS. Digitized and field soil boring logs are provided in Appendix A. Samples were collected in accordance with the Field Sampling Plan (ARCADIS 2007e) and SEIWP. As stipulated in the work plan, soil samples were collected from the locations with the highest PID readings unless the soil was saturated. If the highest PID was identified in the saturated zone, additional soil samples were collected from just above the saturated zone. Borings were advanced until the target depth was reached or refusal due to shallow bedrock was encountered. Upon completion, bentonite chips were used to abandon the borehole. If the borehole was classified as a “regulated hole” according to Minnesota Department of Health (MDH) guidelines, a Borehole Sealing Record was prepared. Copies of Borehole Sealing Records are in Appendix B. The surface disturbance of each borehole was repaired to match surrounding materials.

Groundwater samples were collected from temporary 1-inch-diameter 5-foot-long polyvinyl chloride (PVC) slotted well screens and sufficient PVC casing to reach ground surface installed at 10 of the 86 soil borings. The temporary wells were purged of at least one gallon of groundwater prior to sampling to minimize turbidity. Groundwater samples were collected via disposable polyethylene tubing using a peristaltic pump, or in the event of pump malfunction, a stainless steel check valve. All groundwater samples analyzed for metals were field filtered using a 0.45-micron disposable filter prior to sample collection.

3.1.3 Permanent Monitoring Wells

Eight permanent monitoring wells (AMW-11 through AMW-18) were installed using a hollow stem auger rig with 4 ¼-inch inner diameter and 8 ¼-inch outer diameter augers. Well construction details are included in Table 3 and MDH Well Logs are included in Appendix B. Monitoring wells were constructed with two-inch diameter, five-foot long slotted PVC screens and sufficient PVC riser to reach ground surface (for flush mount wells) or above ground surface (for stickup wells). Each well had a filter sand pack extended approximately one to 2.5 feet above the top of the screened interval. A two-foot bentonite seal was placed over the sand pack and the remaining well annulus was sealed with cement grout to the surface.

Each new permanent monitoring well was developed using over-pumping techniques and a whale pump. Between 11 and 33 well volumes of water were removed from each monitoring well during development to remove sediment and ensure the well was hydraulically connected with the surrounding aquifer.

The newly installed monitoring wells were sampled on October 31 and November 7, 2011. Prior to sampling activities, depth to water measurements were collected from all on-Site wells (Table 4). Monitoring wells were purged of at least three well volumes using a disposable polyethylene bailer prior to sample collection per the Field Sampling Plan (ARCADIS 2007e). After purging, field parameters of pH, conductivity, turbidity, temperature, dissolved oxygen and oxidation reduction potential (ORP) were collected using a Horiba U-52 (Table 5). Groundwater sampling field logs are included in Appendix C. Discrete readings for dissolved oxygen and ORP from bailed groundwater samples are not considered reliable and are not included in Table 5 but are reported on the sampling logs in Appendix C. All groundwater samples analyzed for metals were field filtered using a 0.45-micron disposable filter prior to sample collection.

3.1.4 Surveying

All borings and monitoring wells were surveyed for X, Y and Z coordinates. The ground surface was surveyed for all locations and top of casing elevations were collected for new monitoring wells. Surveying was completed by Sunde Land Surveying, LLC of Bloomington, Minnesota and referenced the National Geodetic Vertical Datum of 1929 (NGVD 29).

3.1.5 Background Metals Analysis and Petroleum Impacts

Several of the metals (arsenic, copper, iron and lead) detected at the Site are elements that are naturally present in Minnesota soils. For those metals, Site specific data collected during this SEI were compared to both the SRV standards and to Minnesota-representative background data sets to determine whether the concentrations present at the Site are consistent with ubiquitous and naturally occurring conditions or if they are indicative of an impacted area. If detections exceeded both the SRV standards and background data sets, that data is discussed below. The full data set for determining background values was published by the United States Geological Survey (USGS) (Boerngen and Shacklette 1981) and included in the Additional Soil Investigation and Surface Soil Risk Assessment Report – Baseball Fields – Feature 139 (ARCADIS 2007c).

Soil samples collected from several of the borings were analyzed for Gasoline Range Organics (GRO) and Diesel Range Organics (DRO). Any detected concentrations of GRO and DRO are noted in this report. There are no SRVs for those constituents; however, they are used as indicator parameters to determine if a more focused compound-specific delineation is required. Recommendations on further investigation and delineation of the petroleum impacts detected at the Site will be withheld until future land use has been determined.

4. Summary of Investigation Results

The following is a summary of all results acquired during the SEI. To facilitate understanding of the extent of contaminants at the Site, the Site footprint has been divided into 11 FAs as shown on Figure 2. The FA boundaries were developed with consideration of identified Features, historical environmental concerns, as well as use and construction sequence of infrastructure. Furthermore, the FAs have been divided into two groups (A and B) with geographic consideration. Group A includes FA-1 through 9, located east of Mississippi River Boulevard, and Group B includes FAs 10 and 11 located west of the boulevard. Note that FA-8 and 10 are not included within this report. FA-8 (Baseball Fields) was addressed in 2008 as described in Section 2.4; FA-10 (Area C), although included in these activities, was reported under separate cover to the MPCA in the May 2013 Draft-Final Area C –Comprehensive Site History and Investigation Report.

Analytical results of soil samples collected within Group A FAs were compared to Tier I Residential and Tier II Industrial SRVs and are summarized in Table 6A. Similarly, analytical results of soil samples collected within Group B FAs were compared to Tier II Recreational and Industrial SRVs and are summarized in Table 6B. Select metals (arsenic, copper, iron, and lead) were also compared to Minnesota-representative background data sets, as previously discussed.

All groundwater analytical results (Table 7) were compared to MDH HRLs and the Environmental Protection Agency (EPA) Maximum Contaminant Level (MCL) (arsenic only).

Soil and groundwater exceedances to date, including results from the Initial Phase II Exterior Investigation, are illustrated individually for each FA on Figures 8 through 23. Laboratory analytical and verification reports are included in Appendix D.

4.1 Group A

Soil and groundwater analytical results for FAs 1 through 9 are discussed in the following sections.

4.1.1 Focus Area 1 – North Parking Lot Area

FA-1 is located in the northern portion of the Site and is bounded to the west by Mississippi River Boulevard, the north by Ford Parkway, and the east by the Site

boundary (Figure 2). The approximately 24-acre area incorporates the North Parking Area, as well as portions of six other Features:

- Former Test Track (Feature 1);
- Former Convoy Underground Storage Tank (UST) (Feature 3);
- Former Area of Impacted Soil – Leak #10700 (Feature 4);
- Former Gasoline, Sunoco Spirits, and Pyroxlin Thinner USTs (Feature 16);
- Potential Film and Staining (Feature 151); and
- Former Fuel Oil UST (Feature 152).

To date within FA-1, 35 soil borings and three permanent monitoring wells have been installed, and 48 soil samples and nine groundwater samples have been collected for laboratory analysis. Six borings (ASB-046, HA-059, HA-060, HA-061, HA-062, and HA-063) and eight groundwater samples were collected from AMW-01 and AMW-08 as part of the Initial Phase II Exterior Investigation. Initial results identified concentrations of only metals exceeding applicable groundwater standards in the eastern portion of the FA, north of the paint building.

4.1.1.1 FA-1 Soil Results

Twenty-nine borings (ASB-115 through ASB-117, ASB-119, ASB-120, ASB-123 through ASB-134, ASB-137 through ASB-143, ASB-148, ASB-157, ASB-158, ASB-160, and ASB-161) were completed to depths ranging from three to 16 feet bgs. Up to two soil samples were collected from each location with the exception of ASB-130, which was not sampled as groundwater was encountered within a foot of ground surface. The forty-two soil samples collected were submitted for laboratory analysis of one or more of the following parameters: VOCs, SVOCs, Resource Conservation and Recovery Act (RCRA) metals, Polynuclear Aromatic Hydrocarbons (PAHs), Polychlorinated biphenyls (PCBs), DRO, and GRO. A sample analytical summary for each boring is provided in Table 1 and soil sample locations and exceedances are shown on Figure 3.

VOCs: A total of 19 constituents were identified within 20 of the 24 samples analyzed. Of the 19 VOCs detected, only 1,2,4-trimethylbenzene (1,2,4-TMB), 1,3,5-trimethylbenzene (1,3,5-TMB), benzene, and total xylenes exceeded applicable SRVs.

1,2,4-TMB exceeded Industrial SRVs and 1,3,5-TMB, benzene, and total xylenes exceeded Residential SRVs at ASB-123.

VOC exceedances (and associated elevated PID readings) are confined to the western portion of FA-1 as defined by ASB-115, ASB-116, and ASB-123, near the Former Area of Impacted Soil – Leak #10700 (Feature 4), and supported by GRO detections.

PAHs: A total of 12 constituents were identified within 21 of the 35 samples analyzed. Of the 12 SVOCs detected, none exceeded either SRV standard.

DRO/GRO: DRO was detected in nine of the 33 samples analyzed, with a maximum concentration of 1,100 milligrams per kilogram (mg/kg) identified at ASB-139. GRO was detected in nine of the 22 samples analyzed, with a maximum concentration of 390 mg/kg at ASB-123.

PCBs: PCBs were not detected in any of the 11 samples analyzed.

Metals: A total of 34 samples were analyzed for RCRA metals. All 34 samples identified concentrations of all eight RCRA metals, but only one (arsenic) exceeded the Residential SRV at ASB-128.

Detections of metals, although observed throughout FA-1, were below background concentrations with the exception of arsenic. SRV exceedances of arsenic are limited to the northeastern portion of FA-1.

General Observations: Field screening of soil also indicated PID readings greater than 10 parts per million (ppm) in the southwest corner of the FA, near the Former Gasoline, Sunoco Spirits, and Pyroxlin Thinner USTs (Feature 16) and Former Fuel Oil UST (Feature 152). Elevated PID readings and the DRO maximum concentration were also observed at ASB-139 near the Former Convoy UST (Feature 3), north of the paint building. Supplemental investigation Feature 3 soil borings did not exhibit similar detections or identify SRV exceedances near ASB-139.

4.1.1.2 FA-1 Groundwater Results

Six temporary wells (ASB-115, ASB-120, ASB-128, ASB-129, ASB-130 and ASB-137) and one permanent well (AMW-17) were installed during the SEI. Groundwater samples collected from each location were submitted for laboratory analysis of one or more of the following: VOCs, RCRA metals, PAHs, PCBs, DRO, and GRO. A sample

analytical summary for the eight samples is provided in Table 1. Groundwater sample locations and exceedances within FA-1 are shown on Figure 4.

VOCs: Eight groundwater samples were collected, detecting a total of 18 VOCs. Of the 18 constituents detected, benzene exceeded its MDH HRL at three locations (AMW-17, ASB-115, and ASB-120). Ethylbenzene exceeded its MDH HRL at ASB-115 and ASB-120.

Groundwater exceedances are consistent with soil exceedances and limited to the western portion of FA-1.

PAHs: Seven samples were collected with a total of four constituents detected. None of the four PAHs detected exceeded their respective HRL.

GRO/DRO: GRO was detected in three of the eight samples analyzed, (AMW-17, ASB-115, and ASB-120), with a maximum estimated concentration of 24,000 µg/L identified at ASB-115. DRO was detected in seven of the eight samples analyzed, with a maximum concentration of 3,400 µg/L identified at ASB-115.

PCBs: PCBs were not detected any of the six samples analyzed.

Metals: Seven samples were collected for dissolved metals and one sample for total lead. Six of the samples identified a total of three dissolved metals. Of the three detected dissolved metals, only arsenic exceeded applicable criteria at ASB-128. This result is consistent with previous investigation results at AMW-08.

4.1.2 Focus Area 2 – Open LUST Releases

FA-2 is located along the northern and eastern limits of the MAB (Figure 2). The approximately 6.8-acre area incorporates portions of six Features:

- North Parking Area (overlaying Feature 5);
- Former Location of Gasoline and Diesel Fuel Underground Piping (Feature 5);
- Former Gasoline, Sunoco Spirits, and Pyroxlin Thinner USTs (Feature 16);
- Former 20,000 Gallon Gasoline AST (Feature 138);
- Former Fuel Oil UST (Feature 152); and

- Previously investigated Features 2 (Former location of Gasoline and Diesel USTs) and 6 (Diesel Meter Shack).

To date, 14 soil borings and three permanent monitoring wells have been installed, and 22 soil samples and eight groundwater samples have been collected for laboratory analysis. Six borings were installed (ASB-001, ASB-002, ASB-030, ASB-045, ASB-047, and ASB-048) and three groundwater samples were collected from ASB-001, ASB-030, and ASB-047 as part of the Initial Phase II Exterior Investigation. Initial results identified concentrations of VOCs above applicable soil standards and concentrations of VOCs, SVOCs, total and dissolved metals in above applicable groundwater standards throughout the FA.

4.1.2.1 FA-2 Soil Results

Eight borings (ASB-118, ASB-121, ASB-122, ASB-136, ASB-145 through ASB-147, and ASB-159) were completed to depths ranging from 11 to 12 feet bgs, or until refusal due to bedrock. A total of 15 soil samples (up to two per boring) were collected and submitted for laboratory analysis of one or more of the following parameters: VOCs, PAHs, RCRA metals, lead, DRO, and GRO. A sample analytical summary for each boring is provided in Table 1 and soil sample locations and exceedances are shown in Figure 5.

VOCs: Twelve samples were analyzed for VOCs and identified a total of 18 constituents. Of the 18 VOCs detected, 1,2,4-TMB, 1,3,5-TMB, benzene, naphthalene, toluene and xylenes exceeded applicable SRVs at three different locations.

- ASB-121: 1,2,4-TMB, 1,3,5-TMB, benzene, and xylenes exceeded Industrial SRVs and naphthalene and toluene exceeded Residential SRVs;
- ASB-122: 1,2,4-TMB, 1,3,5-TMB, and xylenes exceeded Industrial SRVs and benzene exceeded Residential SRVs; and
- ASB-159: 1,2,4-TMB exceeded Industrial SRVs and 1,3,5-TMB exceeded Residential SRVs.

PAHs: Eleven samples were analyzed for PAHs. Ten of the 11 samples analyzed identified a total of ten PAHs. Of the constituents detected, only benzo(a)pyrene (BaP) exceeded Industrial SRV standards at ASB-121.

DRO/GRO: DRO was detected in eight of the 11 samples analyzed, with a maximum concentration of 550 mg/kg identified at ASB-136. GRO was detected in nine of the 12 samples analyzed, with a maximum concentration of 4,000 mg/kg at ASB-121. These detections correspond to the locations with observed elevated PID readings during soil screening.

PCBs: PCBs were not detected either of the two samples analyzed.

Metals: Three samples were analyzed for RCRA metals and eight samples analyzed for lead. Lead was detected in all 11 samples, and six other metals were detected in the three samples analyzed for RCRA metals. None of the detections exceeded applicable standards.

Summary: Supplemental investigation results support initial investigation observations and have identified two areas of impact above criteria. These areas correspond to the Former Location of Gasoline and Diesel Fuel Underground Piping (Feature 5) and the cluster of former underground and aboveground storage tanks (Features 16, 138, and 152).

4.1.2.2 FA-2 Groundwater Results

Two temporary wells (ASB-118 and ASB-145) and three permanent wells (AMW-14, AMW-15, and AMW-16) were installed during the SEI. Groundwater samples were collected from each location and submitted for laboratory analysis of one or more of the following parameters: VOCs, PAHs, RCRA metals, Lead, DRO, and GRO. A sample analytical summary for each sample is provided in Table 1 and locations and exceedances are shown on Figure 6.

VOCs: Five groundwater samples were analyzed for VOCs and identified a total of 18 constituents. Of the 18 constituents detected, six (1,2,4-TMB, 1,3,5-TMB, benzene, ethylbenzene, naphthalene, and xylenes) exceeded MDH HRLs at four locations and include:

- AMW-14: 1,2,4-TMB, ethylbenzene, and xylenes;
- AMW-15: 1,2,4-TMB, 1,3,5-TMB, benzene, ethylbenzene, naphthalene, and xylenes;
- AMW-16: 1,2,4-TMB, 1,3,5-TMB, ethylbenzene, and xylenes; and

- ASB-118: Benzene.

PAHs: A total of nine constituents were detected in three of the four samples analyzed. Of the nine constituents detected, none exceeded applicable criteria.

PCBs: PCBs were not detected either of the two samples analyzed.

DRO/GRO: DRO was detected in the four samples analyzed, with a maximum concentration of 1,200 µg/L at AMW-15. GRO was detected in the five samples analyzed, with a maximum concentration of 15,000 µg/L at AMW-15 and AMW-16.

Metals: Three samples were analyzed for RCRA metals and two samples were analyzed for lead. Two metals (arsenic and barium) were detected in the three samples analyzed. Only arsenic exceeded its respective criteria at AMW-15.

Summary: In agreement with the soil results, groundwater exceedances are observed within two areas of the FA. These analytical results, in conjunction with results from temporary wells sampled during the initial investigation, demonstrate the groundwater impacts within the southern extent of FA-2 are delineated by ASB-145 and ASB-146, along the FA boundary. Along the north edge of the MAB, shallow groundwater impacts (less than 12 feet bgs) extend further west towards Mississippi River Boulevard than previously presented, demonstrating a correlation with the Former Location of Gasoline and Diesel Fuel Underground Piping (Feature 5) rather than Diesel Meter Shack (Feature 6).

4.1.3 Focus Area 4 – Former Hazardous Waste Storage Areas

FA-4 is located south of the bridge between the MAB and paint building, along the eastern and southern limits of the MAB (Figure 2). The approximately 6.8-acre area incorporates portions of twelve Features:

- Southern railroad spurs (Feature 7):
- Former Hazardous Waste Storage Area (Feature 10);
- Former Disposal Area B (Feature 11);
- Former Railroad Spurs (Feature 12);
- Former Oil Fill Area (Feature 20);

- 1996 Glycol Release from Underground Piping (Feature 21);
- Oil/Water Separator Trench (Feature 27); Former Coal Operations (Feature 47);
- Former Hazardous Waste Storage Area (Feature 49);
- Former 20,000 Gallon Gasoline AST (Feature 138);
- Drums (Feature 143); and
- Former Fuel Oil Underground Storage Tank (Feature 152).

To date, 30 soil borings have been completed, three permanent monitoring wells installed, and 43 soil samples and seven groundwater samples collected within FA-4. Twenty of these borings (ASB-005 through ASB-012, ASB-017, ASB-031, ASB-035 through ASB-043, HA-055) and four temporary wells (ASB-005, ASB-006, ASB-036, and ASB-047) were completed as part of the Initial Phase II Exterior Investigation. Initial results identified concentrations of (total) SVOCs and metals above applicable standards in soil and metals above applicable standards in groundwater.

4.1.3.1 FA-4 Soil Results

Ten borings (ASB-135, ASB-162, ASB-168 through ASB-171, ASB-174, ASB-176, ASB-254, and ASB-255) were completed to depths ranging from eight to 12 feet bgs. A total of 16 soil samples (up to three per boring) were collected and submitted for laboratory analysis of VOCs, SVOCs, RCRA or Target Analyte List (TAL) metals, PAHs, PCBs, DRO, and GRO, or a combination thereof. The sample analytical suite for each boring is provided in Table 1. Soil sample locations and exceedances within FA 4 are shown on Figure 7.

VOCs: A total of 17 constituents were detected in 12 of the 16 samples analyzed. Of the 17 VOCs detected, only 1,2,4-TMB and naphthalene exceeded Industrial SRVs at ASB-176. Detections of VOCs within the remaining samples identified VOC concentrations more than two orders of magnitude less than those observed at ASB-176.

SVOCs: Eight samples were analyzed for SVOCs and four samples analyzed for PAHs. Eleven of the 12 samples identified a total of 17 SVOCs. Of the 17 constituents detected, only BaP exceeded Industrial SRVs at ASB-170.

DRO/GRO: DRO was detected in 14 of 15 samples analyzed, with a maximum concentration of 500 mg/kg. GRO was detected in eight of the nine samples analyzed, with a maximum concentration of 4,200 mg/kg. Both maximums were observed at ASB-176, also the location of the elevated PID reading within the FA.

PCBs: Six samples were analyzed for PCBs. One detection was observed at ASB-170 (0.06 mg/kg) and did not exceed SRV standards.

Metals: Five samples were analyzed for TAL metals and six samples were analyzed for RCRA metals. A total of 23 metals were observed in the 11 samples analyzed. Of the 23 metals detected, arsenic exceeded Industrial SRV at ASB-171 and an additional two constituents (copper and iron) exceeded Residential SRVs. Iron exceedances were observed at ASB-170, ASB-171, ASB-174, and ASB-176. A copper exceedance was only observed at ASB-174.

Summary: Supplemental investigation results support the findings of the initial investigation, indicating VOC exceedances were limited to an area bordering the off-site rail yard, SVOCs exceedances extend east of the MAB, corresponding to the extent of the Former Rail Spurs (Feature 12) and Oil/Water Separator and Trench (Feature 27), and metals exceedances are prevalent throughout the FA. The majority of metals exceedances are centralized around an area east of the MAB and an area south of the Former Hazardous Waste Storage Area (Feature 10).

4.1.3.2 FA-4 Groundwater Results

Three permanent wells (AMW-11, AMW-13 and AMW-18) were installed during the SEI. Groundwater samples collected from each location were submitted for laboratory analysis of one or more of the following: VOCs, RCRA metals, PAHs, DRO, and GRO. The sample analytical suite for the four samples is provided in Table 1 and groundwater sample locations and exceedances are shown on Figure 8.

VOCs: Three samples identified a total of nine constituents. Of the nine constituents detected, none exhibited concentrations exceeding their respective criteria. All detections were identified at AMW-11, with the exception of 1,1-Dichloroethane only detected at AMW-18 (1.2 µg/L).

PAHs: Four samples were collected with three of the four samples identifying a total of four constituents. None of the four observed constituents (fluorene, fluoranthene, pyrene, and BaP) exceeded their respective criteria.

DRO/GRO: DRO was detected within each sample, with a maximum concentration of 1,600 µg/L at AMW-11. GRO was only detected at AMW-11 at 3,000 µg/L.

Metals: Four samples were collected and analyzed for RCRA metals. Barium and arsenic were the only detected constituents although neither exceeded their respective criteria.

Analytical results from the permanent wells installed do not correlate with previously installed temporary well sample results in the same locations. PAH and metal exceedances previously identified in the temporary well samples could not be duplicated in the permanent monitoring well analytical results.

4.1.4 Focus Area 5 – Paint Shop

FA-5 is located in the eastern portion of the Site and is bounded to the east by off-Site residential and commercial properties, and contained to the northern, western, and southern limits by the dimensions of the paint building (Figure 2). The approximately 14.1-acre area incorporates portions of the Former Test Track (Feature 1).

To date, ten soil borings have been completed, one permanent monitoring well installed, and ten soil samples and two groundwater samples collected within FA-5. Results have not identified any exceedances of applicable criteria. The original Scope of Work identified only two soil borings to be completed, but an additional eight were installed at the request of Ford, as a portion of the property being investigated was under consideration for lease by a third party at the time.

4.1.4.1 FA-5 Soil Results

Ten borings (ASB-144, ASB-149 through ASB-156, and ASB-187) were completed within the northeastern portion of the FA. Boring depths ranged from eight to 10.5 feet bgs. Ten samples (one per boring) were collected and submitted for laboratory analysis of VOCs, SVOCs, DRO, RCRA metals, and PCBs. The sample analytical suite for each boring is provided in Table 1 and soil sample locations are shown on Figure 9.

One VOC and five metals were detected; however, no constituents were detected above applicable criteria.

4.1.4.2 FA-5 Groundwater Results

No groundwater was encountered in any of the ten borings; therefore groundwater samples were not collected. Boring locations in FA-5 are shown on Figure 10.

4.1.5 Focus Area 6 – Former Hazardous Waste Storage and Disposal Areas

FA-6 is located in the southeastern portion of the Site, and is bounded by FA-5 and FA-8 to the east, the off-Site rail lines to the south, FA-7 to the west, and FA-1 to the north, as depicted on Figures 2. The approximately 15.3-acre area incorporates portions of ten Features:

- Former Test Track (Feature 1);
- Former Hazardous Waste Storage Area (Feature 8);
- Former Disposal Area A (Feature 9);
- Waste Solvent USTs (Feature 35);
- Former Bulk Solvent and Waste Solvent USTs (Feature 36);
- Solvent UST Underground Piping (Feature 37);
- Sump with Solvent UST Basin (Feature 46);
- Sludge Pits (Feature 121);
- Drums (Feature 143); and
- Potential Film/Staining (Feature 151).

To date, 21 soil borings have been completed, six permanent monitoring wells installed, and 24 soil samples and six groundwater samples collected within FA-6. Eleven of these borings (ASB-015, ASB-016, ASB-018, ASB-019, ASB-020, ASB-032 through ASB-034, ASB-044, HA-056, and HA-058) and six permanent monitoring wells (AMW-03A, AMW-03B, AMW-04, MW-4, MW-5, and MW-6) were completed as part of the Initial Phase II Exterior Investigation. Initial results identified metal concentrations above applicable soil criteria within the southern portion of the FA.

4.1.5.1 FA-6 Soil Results

Ten borings (ASB-177 through ASB-186) were completed to depths ranging from four to 11.5 feet bgs. A total of 13 samples (up to two per boring) were collected and submitted for laboratory analysis of one or more of the following parameters: VOCs, SVOCs, RCRA or TAL metals, DRO, and GRO. Samples associated with Feature 9 (ASB-177 and ASB-181 through ASB-183) were mistakenly omitted for SVOC analysis. The sample analytical suite for each boring is provided in Table 1 and sample locations and exceedances are shown on Figure 11.

VOCs: A total of 15 constituents were detected in seven of the 13 samples analyzed. Of the 15 constituents detected, five (1,2,4-TMB, 1,3,5-TMB, butylbenzene, naphthalene, and xylenes) exceeded Industrial SRVs at one location (ASB-182). No other exceedances were observed.

SVOCs: A total of 12 constituents were detected in two of the nine samples analyzed. None of the constituents detected exceeded applicable criteria.

DRO/GRO: DRO was detected in five of nine samples analyzed, with a maximum concentration of 3,600 mg/kg at ASB-182. GRO was detected in four of seven samples analyzed, with a maximum concentration of 6,200 mg/kg at the same location. In addition, elevated PID readings were also identified along the FA-7 boundary at ASB-181 and ASB-182.

PCBs: PCBs were not detected any of the five samples analyzed.

Metals: Six samples were analyzed for RCRA metals and the remaining seven samples were analyzed for TAL metals. A total of 22 metals were identified within the 13 samples analyzed. Of the 22 constituents detected, two (lead and iron) exceeded Residential SRVs. Iron was the most prevalent, detected at these elevated concentrations in the seven samples analyzed.

Summary: Supplemental investigation results support initial investigation observations, which identify iron above Residential SRVs through the FA. Additionally, VOCs, supported by other indicators (i.e. PID readings, DRO and GRO) have been identified along the southeastern edge of the FA.

4.1.5.2 FA-6 Groundwater Results

No groundwater was encountered in any boring; therefore groundwater samples were not collected. Boring locations in FA-6 are shown on Figure 12.

4.1.6 Focus Area 7 – Railroad Tracks

FA-7 is located in the central portion of the Site and encompasses the railroad spurs between the MAB and paint building, as depicted on Figures 2. The approximately 4.3-acre area incorporates portions of four Features:

- Railroad Spurs (Feature 7);
- Former Hazardous Waste Disposal Area (Feature 10);
- Former Disposal Area B (Feature 11); and
- Former Fuel Oil UST (Feature 152).

To date, 16 soil borings have been completed, one permanent monitoring well installed, and 23 soil samples and four groundwater samples collected within FA-7. Four of these borings (ASB-003, ASB-004, ASB-013, and ASB-014) and two temporary wells (ASB-003 and ASB-013) were completed as part of the Initial Phase II Exterior Investigation. Initial investigation results identified VOCs and metals (both total and dissolved) in excess of applicable soil and groundwater criteria.

4.1.6.1 FA-7 Soil Results

Twelve borings (ASB-163 through ASB-167, ASB-172, ASB-173, ASB-175, ASB-258 through ASB-261) were completed to depths ranging from eight to 12 feet bgs. A total of 18 samples (up to two per boring) were submitted for laboratory analysis of one or more of the following parameters: VOCs, SVOCs, RCRA or TAL metals, PAHs, DRO, and GRO. No samples were collected from ASB-164 because saturated soils were encountered near the surface and did not allow for unsaturated soil sample collection. Samples associated with Feature 11 were inadvertently omitted for SVOC analysis (ASB-172, ASB-173, and ASB-175). The sample analytical suite for each boring is provided in Table 1 and sample locations and exceedances are shown on Figure 13.

VOCs: A total of 14 constituents were detected in 14 of the 18 samples analyzed. Of the 14 constituents detected, only naphthalene exceeded Residential SRVs at one location along the property boundary (ASB-175).

SVOCs: A total of 15 constituents were observed in the 13 samples analyzed for SVOCs and two samples analyzed for PAHs. Of the 15 constituents detected, none exceeded applicable criteria.

PCBs: Eight samples were analyzed for PCBs. PCBs were detected at ASB-167, although concentrations did not exceed applicable criteria.

DRO/GRO: DRO was detected in 16 of the 17 samples analyzed, with a maximum concentration of 5,800 mg/kg at ASB-175. GRO was detected in nine of the ten samples analyzed, with a maximum concentration of 2,600 mg/kg at the same location.

Metals: A total of 23 constituents were detected within the eight samples analyzed for RCRA metals and eight samples analyzed for TAL metals. Of the 23 constituents detected, four (antimony, arsenic, lead, and mercury) exceeded Industrial SRVs and an additional three (cadmium, chromium, and iron) exceeded Residential SRVs. Exceedances included:

Analyte	Residential SRV Exceedance Location	Industrial SRV Exceedance Location
Antimony	ASB-172 and ASB-175	ASB-166 and ASB-167
Arsenic	Not Applicable	ASB-165, ASB-258, ASB-259, ASB-260, and ASB-261
Cadmium	ASB-166	None
Chromium	ASB-166	None
Iron	ASB-165, ASB-167, ASB-172, and ASB-173	None
Lead	ASB-167	ASB-166, ASB-172, and ASB-175
Mercury	Not Applicable	ASB-175

Summary: Supplemental investigation results support previously observed initial investigation results. VOCs exceed criteria along the northern edge of the FA boundary and metals exceed criteria throughout the FA.

4.1.6.2 FA-7 Groundwater Results

One temporary well (ASB-166) and one permanent monitoring well (AMW-12) were installed during the SEI. A groundwater sample was collected from each location and submitted for laboratory analysis of VOCs, PAHs, RCRA metals, GRO and DRO (AMW-12) and dissolved arsenic at ASB-166. Sampling locations and groundwater exceedances are shown on Figure 14.

VOCs: A total of 12 VOCs were detected in AMW-12 (none were detected in ASB-166). Of the 12 VOCs detected, five (1,2,4-TMB, 1,3,5-TMB, benzene, ethylbenzene, and total xylenes) were detected above their applicable criteria.

PAHs: The only detected PAH constituent was 2-Methylnapthalene at a concentration of 74 µg/L. No HRLs are defined for the constituent.

GRO/DRO: GRO and DRO were detected at concentrations of 13,000 µg/L and 620 µg/L, respectively.

Metals: Two metals were detected (arsenic and barium) and only arsenic was detected above the EPA MCL.

Summary: The exceedances identified in this Supplemental Investigation are supported by previously completed Initial Investigation results. The groundwater exceedances observed in the southern portion of the FA are consistent with previously identified exceedances.

4.1.7 Focus Area 9 – Main Assembly Building (Specific to Residential Cleanup)

FA-9 is located along Mississippi River Boulevard, extending from the northern edge of the MAB to the southern property boundary, as depicted on Figure 2. The approximately 24.1-acre area incorporates portions of three exterior Features:

- Former Location of Gasoline and Diesel Fuel Underground Piping (Feature 5);
- Railroad Spurs (Feature 7); and

- Unleaded Gasoline USTs (Feature 24).

To date, eight soil borings have been completed, three permanent monitoring well installed and 12 soil samples and three groundwater samples collected within FA-9. Four of these borings (ASB-021, ASB-022, ASB-028, and ASB-029) and all permanent monitoring well installation and sampling was completed as part of the Initial Phase II Exterior Investigation. Initial results did not identify concentrations of any constituents in above applicable standards in soil throughout the FA. However, results did identify total metals concentrations in excess of applicable groundwater criteria in the northwestern portion of the FA at AMW-06.

4.1.7.1 FA-9 Soil Results

Four borings (ASB-199, ASB-200, ASB-256 and ASB-257) were completed to depths ranging from seven to 11.5 feet bgs. A total of eight samples (two per boring) were collected and submitted for laboratory analysis of one or more of the following parameters: VOCs, SVOCs, RCRA metals, PAHs, DRO, and GRO. The sample analytical suite for each boring is provided in Table 1 and sample locations are shown on Figure 15.

VOCs: A total of four constituents were observed in five of the eight samples analyzed. None of the four detections exceeded applicable criteria.

SVOCs: A total of eight constituents were observed in three of the samples analyzed for SVOCs and four samples analyzed for PAHs. None of the eight constituents detected exceeded applicable criteria.

DRO/GRO: DRO was detected in the eight samples analyzed, with a maximum concentration of 37 mg/kg at ASB-256. GRO was not detected in any of the four samples analyzed.

PCBs: PCBs were not detected in either of the two samples analyzed.

Metals: A total of five constituents were detected within the four samples analyzed for RCRA metals and four samples analyzed for dissolved lead. None of the metals detected exceeded applicable criteria.

Supplemental investigation results support the lack of elevated concentrations previously observed during the Initial investigation.

4.1.7.2 FA-9 Groundwater Results

No groundwater was encountered in any boring; therefore groundwater samples were not collected. Boring locations in FA-9 are shown on Figure 16.

4.2 Group B

Soil and groundwater analytical results collected during the supplemental investigation pertaining to FA-11 are discussed in the following sections. Although investigation activities were completed within FA-10 per the defined scope, results are addressed under separate cover in the May 2013 Draft-Final Area C –Comprehensive Site History and Investigation Report.

4.2.1 Focus Area 11 – Wastewater Treatment Plant

FA-11 is located in the western portion of the Site bounded by the Mississippi River (west), Lock and Dam No. 003 (north) and Mississippi River Boulevard (east), as depicted on Figure 2. The approximately 6.9-acre area incorporates six Features:

- Former Fuel Oil ASTs (Feature 42);
- Wastewater Collection ASTs (Feature 44);
- Wastewater Treatment Area (Feature 134);
- Former Waste Disposal Area (Feature 140);
- Former Coal Gasification Plant (Feature 153); and
- Former Tar Decanter House (Feature 154).

To date, 16 soil borings have been completed, three permanent monitoring wells installed, and 23 soil samples and two groundwater samples collected within FA-11. Five of these borings (ASB-023 through ASB-027) and all permanent well installation and sampling was completed as part of the Initial Phase II Exterior Investigation. Initial results identified concentrations of (total) metals above applicable soil and groundwater standards along the west and north portions of the FA.

4.2.1.1 FA-11 Soil Results

Eleven borings (ASB-188 through ASB-198) were completed to depths ranging from two to 15 feet bgs. A total of 18 samples (up to two per boring) were collected for laboratory analysis of one or more of the following parameters: VOCs, SVOCs, RCRA or TAL metals, DRO, and GRO. The sample analytical suite for each boring is provided in Table 1 and sample locations and exceedances are shown on Figure 17.

VOCs: A total of 16 constituents were observed in the eight samples analyzed. None of the detections exceeded applicable criteria.

SVOCs: A total of 12 constituents were observed in the eight samples analyzed. Of the 12 constituents detected, only BaP exceeded Industrial SRVs at ASB-195 and ASB-198. Detections of BaP were also observed in additional borings installed in proximity to ASB-193 and ASB-194, although concentrations were at least an order of magnitude lower and did not exceed applicable criteria.

DRO/GRO: DRO was detected in the three samples analyzed, with a maximum concentration of 57 mg/kg at ASB-198. GRO not detected in any of the three samples analyzed.

Metals: A total of 21 metals were observed in the eighteen samples analyzed. Of the 21 constituents detected, iron was the only constituent observed at concentrations above applicable criteria. Residential SRV was exceeded at ASB-196 (16,000 mg/kg) and ASB-197 (14,000 mg/kg).

Summary: Supplemental investigation results support initial investigation observations, which identified iron to exceed Residential SRVs. Previously observed exceedances of lead directly east of the Wastewater Treatment Area (Feature 134) were not confirmed in any of the ten samples collected in the area as detections ranged from 2.5 to 16 mg/kg.

4.2.1.2 FA-11 Groundwater Results

No groundwater was encountered in any boring; therefore groundwater samples were not collected. Permanent monitoring well locations in FA-11 and cumulative groundwater exceedances are shown in Figure 18.

5. Summary of Findings

A total of 86 direct push soil borings, ten temporary wells and eight permanent wells were completed within eight FAs to further investigate 26 Features for soil and groundwater impacts during the SEI. Three areas (Feature 23, 49 and 121) were not investigated due to utility interferences or other obstructions, but are planned to be completed as part of the Supplemental Phase II Exterior Delineation Investigation. As shown in the summary table below, six of the eight Focus Areas had soil exceedances of at least one SRV (excluding naturally occurring elements when they were detected at concentrations within the range of naturally occurring concentrations) and all eight FAs had groundwater exceedances of at least one applicable groundwater criteria.

Feature Name	Feature	Frequency of Exceedances		SRV Exceedances			HRL/MCL Exceedances	Analytes
		SO	GW	Res.	Rec.	Ind.		
North Parking Area	NPA	2/19	3/6	Yes	Yes	Yes	Yes	VOCs, Metals

Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
North Parking Area	The North Parking Area consists of approximately 29 acres and is mainly used for employee parking, as well as storage for newly built Ford Ranger and Mazda Series trucks prior to shipment off-site. Initial Investigation: None.	Complete **nineteen soil borings** in the north parking area to further investigate the area. The area was divided into 1-acre grids, and one boring will be installed within each grid except for those grid locations in which either a well or boring is currently installed or a well or boring will be installed. Two soil samples will be collected from each boring. If potential impacts extend to the water table, convert a maximum of four soil borings to temporary monitoring wells and sample groundwater, if encountered.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-115, ASB-116, ASB-118, ASB-123, ASB-136 PID Exceedances (above 10 ppm), entire boring: ASB-115, ASB-123,	Nineteen Geoprobe borings (ASB-115, ASB-116, ASB-117, ASB-118, ASB-123, ASB-124, ASB-125, ASB-126, ASB-128, ASB-129, ASB-130, ASB-131, ASB-132, ASB-134, ASB-136, ASB-137, ASB-141, ABS-142, ASB-143) Soils were continuously logged from the surface to the bottom of each bore hole.	Six temporary groundwater well set and sampled from ASB-115, ASB-118, ASB-128, ASB-129, ASB-130, ASB-137.	Soil: DRO (Wisconsin Modified Method) RCRA Metals (Method 6010) PAHs (Method 8270C) Soil (Provisional): VOCs (Method 8260B) GRO (Wisconsin Modified Method) PCBs (Method 8082) Groundwater (Provisional): VOCs (Method 8260) PAHs (Method 8270) DRO (Wisconsin Modified Method) GRO (Wisconsin Modified Method) RCRA Metals (Method 6010),Dissolved PCBs (Method 8082)
Former Test Track Feature 1 Eastern Portion of TCAP Property	Based on a review of aerial photographs, the former test track was historically used to test vehicles from prior to 1953 until prior to 1974. The test track was sprayed with oil for dust control based on information provided through interviews with TCAP personnel. Initial Investigation: Two Hollow Stem Auger borings (ASB-033, ASB-046).	Complete **seven soil borings** in the area of the former test track to further investigate the area. Eight borings will be located approximately 660 feet apart along the track. If potential impacts extend to the water table, convert a maximum of four soil borings to temporary monitoring wells and sample groundwater, if encountered.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Six Geoprobe borings (ASB-127, ASB-133, ASB-144, ASB-178, ASB-184, ABS-187) One boring was not completed due to interference with ongoing operations at TCAP at the time of the investigation. Soils were continuously logged from the surface to the bottom of each bore hole.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) DRO (Wisconsin Modified Method) RCRA Metals (Method 6010) PCBs (Method 8082) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) DRO (Wisconsin Modified Method) RCRA Metals (Method 6010),Dissolved PCBs (Method 8082)
Former Convoy UST Feature 3 Located Approximately 200 feet East of the Training Facility	A confirmed release (Leak #5343) from the former Convoy 2,000 gallon diesel UST was reported during UST removal activities in 1992. Approximately 150 cubic yards of soil was excavated during the remedial action. A soil boring program was implemented at the request of the MPCA to define the extent of impacts. Seven samples were collected from the sidewalls and bottom of the tank excavation and five samples were collected from boreholes completed to delineate the horizontal extent of impacts. Approximately 125 cubic yards of impacted soil were left in place beneath the clean fill used to replace the UST excavation. The release was closed in September 1992 because the impacts were delineated and vertical migration of the impacts was limited by the bedrock approximately 10 ft bgs.	Complete **three soil borings** in the area of the former Convoy UST to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-139	Three Geoprobe borings (ASB-138, ASB-139, ASB-140) Soils were continuously logged from the surface to the bottom of each bore hole.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) Lead (Method 6010) GRO and DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) Lead (Method 6010), Dissolved GRO and DRO (Wisconsin Modified Method)

Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Former Area of Impacted Soil - Leak #10700 Feature 4 Located in the Area Beneath the Westernmost Portion of the Current Training Center	An area of soil impacted with gasoline and diesel was reported in 1997. The impacts were the results of leakage from product lines running to gasoline and diesel USTs that were removed in 1993. The area was entered into the VPIC program in December 1997. The impacted soils were excavated and the release was closed in February 1998. A Development Response Action Plan (DRAP) was approved in February 1997 for construction of a training center in the area. During construction of the training center a total volume of 3,078 CY of impacted soil was disposed of and 50,693 gallons of groundwater generated from dewatering of the excavation was discharged to the sanitary sewer system via a permit from the City of St. Paul. A total of 31 soil borings were completed during historical investigations in the area. Twenty soil samples and 11 groundwater samples were collected and submitted to a laboratory for analysis.	Complete **two soil borings** north and west of the former leak to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Two Geoprobe borings (ASB-119, ASB-120) Soils were continuously logged from the surface to the bottom of each bore hole.	Temporary groundwater well set and sampled from ASB-120.	Soil: VOCs (Method 8260B) Lead (Method 6010) GRO and DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) Lead (Method 6010), Dissolved GRO and DRO (Wisconsin Modified Method)
Former Location of Gasoline and Diesel Fuel Underground Piping Feature 5 Along northern potion of main assembly building beneath the current training center and employee parking lot	Underground steel piping was formerly utilized in conjunction with former gasoline and diesel fuel USTs in the area, which were removed in 1993. The piping had been in place since approximately 1977. Some piping may still be in place below the ground surface. The piping is estimated to be present approximately 4 to 8 feet bgs. A release occurred from the piping which impacted subsurface soils. Remedial activities were completed in the area of the piping, which included soil removal. However, in 2004-2005 during a water main repair in the area of the piping, a subsequent release was reported. The releases have been closed per the MPCA; however, based on the recurrent releases identified, impacted soil may still be present in the area of the underground piping. <u>Initial Investigation:</u> Five Hollow Stem Auger borings (ASB-029, ASB-030, ASB-045, ASB-047 and ASB-048). Temporary groundwater wells set and sampled from ASB-030 and ASB-047.	Complete **five soil borings** along the former underground piping route. Borings will be placed approximately every 150 feet along the former piping route. **Two monitoring wells** will be installed to confirm the exceedances identified at boring locations ASB-030 and ASB-047. A groundwater sample from each well will be collected for analysis.	Organic Vapors using a PID. PID Exceedances (above 10 ppm), entire boring: ASB-121, ASB-122	Four Geoprobe borings (ASB-121, ASB-122, ASB-199, ASB-200) One boring was not completed due to utility interference. Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	Two permanent groundwater wells set and sampled from AMW-16 and AMW-17.	Soil: VOCs (Method 8260B) PAHs (Method 8270C) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Lead (Pb) (Method 6010) Groundwater: VOCs (Method 8260B) PAHs (Method 8270C) Lead (Method 6010), Dissolved GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Railroad Spurs Feature 7 Central and southern portions of property	Railroad spurs are utilized for the delivery and loading of parts and other items to and from the assembly plant via rail cars. In addition, railcars are used to transfer final products to their retail destinations. Some areas of staining were observed within the vicinity of the railroad spurs. Initial Investigation: Five Hollow Stem Augers borings (ASB-017, ASB-021, ASB-022, ASB-031, ASB-043).	Complete **eight soil borings** in the area of the railroad spurs to further investigate potential impacts. Four borings will be located in the rail yard at the center of the site not previously investigated. The other four borings will be completed near the three sets of railroad spurs at the south portion of the plant. If potential impacts extend to the water table, convert soil borings (a maximum of three) to temporary monitoring wells and sample groundwater, if encountered.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Eight Geoprobe borings (ASB-254, ASB-255, ASB-256, ASB-257, ASB-258, ASB-259, ASB-260, ASB-261).	Temporary groundwater well set and sampled from ASB-257.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) DRO (Wisconsin Modified Method) PCBs (Method 8082) If staining is present from the 0-2 foot interval, a minimum of two samples will be analyzed for PCBs. RCRA Metals (Method 6010) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) DRO (Wisconsin Modified Method) PCBs (Method 8082) RCRA Metals (Method 6010), Dissolved
Former Hazardous Waste Storage Area Feature 8 Southwest of the paint building	Based on historical documentation reviewed, a former hazardous waste storage area was identified. The documentation did not include any reported spills from this area; however, based on the general usage of the area to store hazardous waste materials this area was investigated. Initial Investigation: Two Hollow Stem Auger borings (ASB-034, ASB-044).	Complete **three soil borings** in the area of the former hazardous waste storage area to provide additional information. Three borings will be located approximately 130 feet apart. If potential impacts extend to the water table, convert soil borings to temporary monitoring wells and sample groundwater, if encountered.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Two Geoprobe borings (ASB-179, ASB-180). One boring was co-located with a Feature 1 boring location (ASB-178). Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) TAL Metals (Method 6010) PCBs (Method 8082) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) TAL Metals (Method 6010), Dissolved PCBs (Method 8082) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)
Former Disposal Area A Feature 9 Southwest of the Paint Building	This area was utilized as a historical disposal site for waste materials along with Former Disposal Area B (Feature 11) generated from the assembly and painting operations. Samples collected from six soil borings completed in 1992 indicated VOCs and metals were present at concentrations that exceeded remediation criteria. The areas with soil exceedances were excavated from 1992 to 1993 and relocated to Area C. Confirmation samples collected from the excavated areas and confirmed that the cleanup goals had been achieved. The Response Action Final Completion Report that documented the remediation activities was accepted by the MPCA in April 1993 and the area was delisted from the PLP in July 1993.	Complete **four soil borings** at Former Disposal Area A to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-181, ASB-182 PID Exceedances (above 10 ppm), entire boring: ASB-182	Four Geoprobe borings (ASB-177, ASB-181, ASB-182, ASB-183). Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were set due to lack of sufficient groundwater observed in the boreholes.	Soil: VOCs (Method 8260B) TAL Metals (Method 6010) GRO and DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) TAL Metals (Method 6010), Dissolved GRO and DRO (Wisconsin Modified Method)

Former Hazardous Waste Storage Area Feature 10 Near Packer Building	Based on historical documentation reviewed, a former hazardous waste storage area was identified in the area. The documentation did not include any reported spills from this area; however based on the general usage of the area to store hazardous waste materials this area was investigated. Initial Investigation: Two Hollow Stem Auger borings (ASB-013, ASB-014). Temporary groundwater well set and sampled from ASB-013.	Complete **six soil borings** in the area of the former hazardous waste storage area. Three step-out borings will be positioned in a manner to delineate the exceedances from ASB-014. In addition, one boring will be positioned near the location of ASB-014 location to provide vertical delineation of the exceedance. Also, two borings will be installed in the area of the former hazardous waste storage area to provide additional information. Convert boring near ASB-014 to a temporary monitoring well and sample groundwater, if sufficient groundwater is present.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-166, ASB-167	Six Geoprobe borings (ASB-164, ASB-165, ASB-166, ASB-167, ASB-170, ASB-171) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	Temporary groundwater well set and sampled from ASB-166.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) TAL Metals (Method 6010) PCBs (Method 8082) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Arsenic (Method 6010) TCLP – Arsenic See other considerations for individual boring analytical requirements. Groundwater (Provisional): Arsenic (Method 6010), Dissolved
Former Disposal Area B Feature 11 Southeast of Main Assembly Building	This area was utilized as a historical disposal site along with Former Disposal Area A (Feature 9) for waste materials generated from the assembly and painting operations. Twenty-six (26) samples collected from seventeen soil borings completed in 1992 indicated VOCs and metals were present at concentrations that exceeded remediation criteria. In addition, groundwater samples were collected from 10 monitoring wells at Former Disposal Area B and verification samples were collected from the sidewalls and bottom of excavations. The areas with soil exceedances were excavated from 1992 to 1993 and relocated to Area C. Confirmation samples collected from the excavated areas and confirmed that the cleanup goals had been achieved. The Response Action Final Completion Report that documented the remediation activities was accepted by the MPCA in April 1993 and the area was delisted from the PLP in July 1993.	Complete **five soil borings** at Former Disposal Area B to provide additional assessment of this feature. Convert up to three borings to temporary monitoring wells and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-172, ASB-173, ASB-175, ASB-176	Five Geoprobe borings (ASB-172, ASB-173, ASB-174, ASB-175, ASB-176) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were set due to lack of sufficient groundwater observed in the boreholes.	Soil: VOCs (Method 8260B) TAL Metals (Method 6010) GRO and DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) TAL Metals (Method 6010), Dissolved GRO and DRO (Wisconsin Modified Method)

Outfall 001 Feature 15 Southwest of TCAP property in Hidden Fall Regional Park	Outfall 001 is regulated under the Site's NPDES permit and discharges into Hidden Falls Regional Park. According to documentation maintained at the MPCA, three separate spill events occurred at the Hidden Falls storm drain Outfall 001 in July, August and September of 1989. Samples were taken from the outfall area by MPCA representatives, which indicated the presence of MIBK and other solvents. During a meeting with MPCA representatives, Ford indicated that the suspected source of the spill was most likely a catch basin around four USTs containing solvents. Ford agreed to complete the requirements to define the extent of contamination surrounding the waste solvent tanks and proposed remediation addressed in the RFRA issued by the MPCA in June 1990. However, documentation pertaining to additional closure sampling at Outfall 001, following the identification of the presence of MIBK, was not found at files maintained at the TCAP or the MPCA. A site reconnaissance was conducted of the area and no visual impacts were observed.	Outfall 001 is regulated under the Site's NPDES permit and discharges into Hidden Falls Regional Park. According to documentation maintained at the MPCA, three separate spill events occurred at the Hidden Falls storm drain outfall (001) in July, August and September of 1989. Samples were collected from the outfall area by MPCA representatives, which indicated the presence of MIBK and other solvents. During a meeting with MPCA representatives, Ford indicated that the suspected source of the spill was most likely a catch basin around four USTs containing solvents. Ford agreed to complete the requirements to define the extent of contamination surrounding the waste solvent tanks and proposed remediation addressed in the RFRA issued by the MPCA in June 1990. However, documentation pertaining to additional closure sampling at Outfall 001, following the identification of the presence of MIBK, was not found at files maintained at TCAP or the MPCA.	None. Considerations: Outfall 001 will be sampled as part of the Mississippi River Sampling activities and is described in the work plan titled *Groundwater Seep and Mississippi River Sampling Work Plan* dated April 11, 2008.	None.	None.	None.
Former Gasoline, Sunoco Spirits, and Pryoxlin Thinner USTs Feature 16 East of Central Engineering Office	Two former 20,000 gallon gasoline USTs were located east of the former oil house and eight 6,000 gallon gasoline, Sunoco spirits and pryoxlin thinner USTs were located north of the former oil house, which were utilized in conjunction with the former paint operations that occurred within the main assembly building. The estimated depth to the base of the former USTs is approximately 10 to12 feet bgs. Documentation pertaining to the removal and subsequent closure of the USTs was not found in files maintained at TCAP or the MPCA. <u>Initial Investigation</u>: Two Hollow Stem Auger borings (ASB-001, and ASB-002). Temporary groundwater well set and sampled from ASB-001.	Complete **seven soil borings** in the area of the former gasoline, Sunoco spirits, and pryoxlin USTs to delineate exceedances of criteria at ASB-001 and ASB-002. Seven step-out borings will be positioned in a manner to delineate the exceedances. Install **two permanent monitoring wells** and collect a groundwater sample for analysis. The wells will be co-located with the original ASB-001 and ASB-002 locations to provide vertical delineation of the exceedances.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-157, ASB-158, ASB-159, ASB-160, ASB-161	Five Geoprobe borings (ASB-157, ASB-158, ASB-159, ASB-160, ASB-161) Two soil borings, located inside the Battery House, were not completed due to clearance restrictions. Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	Two permanent groundwater wells set and sampled from AMW-14 and AMW-15.	Soil: VOCs (Method 8260B) PAHs (Method 8270C) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Groundwater: VOCs (Method 8260B) PAHs (Method 8270C) RCRA Metals (Method 6010), Dissolved GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)

Table 1. Summary of Supplemental Phase II-Exterior Investigation Activities
Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Former Oil Fill Area Feature 20 Northeast of the Coal Hopper House	A review of historical drawings indicated the presence of a former oil fill location. Based on the former use of the area the oil fill location was investigated. Initial Investigation: Hollow Stem Auger borings (ASB-006, ASB-007). Temporary groundwater well set and sampled from ASB-006.	**One monitoring well** will be installed to evaluate the exceedances identified at boring location ASB-006. Install **one monitoring well** and collect a groundwater sample for analysis.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Soil assessment was not conducted.	One permanent groundwater well set and sampled from AMW-13.	Groundwater: PAHs (Method 8270C) RCRA Metals (Method 6010), Dissolved DRO (Wisconsin Modified Method) GRO (Wisconsin Modified Method)
1996 Glycol Release From Underground Piping Feature 21 Along eastern portion of main assembly building	In 1996 a leak occurred from underground piping used to transfer glycol along the eastern portion of the main assembly building. The piping is estimated to be present approximately 4 to 8 feet bgs. Based on available documentation reviewed, remediation activities were completed in the area of the release; however there was no documentation indicating that the release had been adequately remediated per the MPCA. Therefore, the glycol release represents a Feature. Initial Investigation: Two Hollow Stem Auger borings (ASB-008**,** ASB-009).	Complete **one soil boring** near ASB-008 to provide additional information.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	One Geoprobe boring (ASB-168). Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	None.	Soil: VOCs (Method 8260B) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)
Former Brake Fluid UST Feature 23 Near southwest corner of main assembly building	A former 6,000-gallon brake fluid UST was used in fluid fill operations at TCAP. The UST was installed in 1968 and removed in 1990. The UST was of steel construction. The estimated depth to the base of the former UST is approximately 8 to 10 feet bgs. A review of available documentation indicated that there were no reported releases from this UST; however, no documentation pertaining to removal activities or closure sampling was found in files maintained at TCAP or the MPCA. Initial Investigation: No borings installed due to utilities.	Investigation will be completed during the interior investigation. Complete **four soil borings** in the area of the former brake fluid UST area to investigate potential impacts.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	No soil assessment or sampling was conducted due to utility interference.	No temporary wells were set due to utility interference.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)

Table 1. Summary of Supplemental Phase II-Exterior Investigation Activities
Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Unleaded Gasoline USTs Feature 24 West of the warehouse	Two 20,000-gallon unleaded gasoline USTs (Figure 19) are currently utilized in conjunction with the fluid fill operations on the assembly line. The USTs are of STI-P3 construction with cathodic protection. The estimated depth to the base of the USTs is approximately 10 to12 feet bgs. A review of available documentation indicated that there were no reported releases from the USTs. Initial Investigation: One Hollow Stem Auger boring (ASB-028).	None.	None.	None.	None.	None.
Oil/Water Separator and Trench Feature 27 North of packer building	An approximate 3,000-gallon oil/water separator collects an oil/water mixture from a 100-foot long collection trench. Since this subsurface structure collects oil and water mixture and the integrity of the structure could not be inspected it is considered a Feature. Once the oil/water separator has been emptied and cleaned, the integrity of the structure will be evaluated. The depth of this Feature is still being researched. Initial Investigation: Three Hollow Stem Auger borings (ASB-010, ASB-011, ASB-012).	Complete **one soil boring** in the area of the oil/water separator and trench to further investigate potential impacts. If potential impacts extend to the water table, convert soil borings to temporary monitoring wells and sample groundwater, if encountered.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	One Geoprobe boring (ASB-168). Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010) DRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010), Dissolved DRO (Wisconsin Modified Method)

Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Waste Solvent USTs Feature 35 West of the Hazardous Waste Storage Building **Former Bulk Solvent and Waste Solvent USTs** Feature 36 West of the Hazardous Waste Storage Building **Solvent UST Underground Piping** Feature 37 South of Paint Building **Sump within Solvent UST Basin** Feature 46 Northwest Corner of the UST Basin	Two 10,000 gallon USTs that store used purge solvent and cleaning solvent generated from the painting process at TCAP. The USTs are located in a basin/bunker which is raised approximately 3 to 4 feet above ground surface. During the fall of 1984 the UST area was constructed and four USTs were installed to store paints, resin and new solvents delivered to TCAP in tanker trucks. The estimated depth to the base of the former USTs is approximately 10 to12 feet bgs. A release was reported from the USTs in 1989 and remedial activities were completed in the area as part of the PRP investigation completed at TCAP. Three monitoring wells were installed in the area and were sampled annually until 2003, when the MPCA deemed the sampling not necessary. MIBK is still present in the area of the former USTs in the sump. Piping is utilized to collect solvent waste generated during the painting process that is then transferred to the used solvent USTs located south of the paint building. The piping is located in a concrete trench which is estimated to be approximately 1 to 2 feet bgs. Additional piping is utilized to transfer the used solvents from the USTs to unloading ports near the southwestern portion of the paint building for removal. Collection of groundwater from solvent UST basin which gets pumped to paint sludge pits. The sump is monitored annually due to a former release which occurred from the former solvent USTs that were removed from the area in 1992. Based on monitoring results MIBK is still detected above the applicable criteria in the sump and the next monitoring event is scheduled in fall of 2008. The base of the sump is estimated to be approximately 2 to 4 ft bgs. <u>Initial Investigation</u>: Three Hollow Stem Auger borings (ASB-018, ASB-019, and ASB-020). No temporary monitoring wells were installed.	Complete **two soil borings** to provide additional assessment of this feature. If potential impacts extend to the water table, convert one soil boring to a temporary monitoring well and a groundwater sample will be collected.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Two Geoprobe borings (ASB-185, ASB-186) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010), Dissolved

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Former Fuel Oil UST Feature 41 South of Steam Plant	The former 26,500 gallon fuel oil UST was installed south of the steam plant in approximately 1950. Based on the location of the UST it could not be removed without possibly compromising the structural integrity of the steam plant; therefore, it was closed in place in 1990. A release was reported from the UST in 1990 during its in place closure (Leak 3262). A subsurface investigation was conducted in 1991 which detected some impacts to both soil and groundwater in the area. Additional groundwater monitoring was conducted until the MPCA issued a closure letter for the release in December 1994.	None.	None.	None.	None.	None.
Former Fuel Oil ASTs Feature 42 South of Steam Plant	Former fuel oil ASTs were located south of the Steam Plant. The ASTs were removed from service in 2000 and corrective actions were completed between August 1, 2000 and October 16, 2000. The corrective actions included removal of the remaining fuel oil from the in service AST, cleaning of the AST and associated piping and dismantling of the two ASTs for recycling. <u>Initial Investigation</u>: One Hollow Stem Auger boring (ASB-026). No temporary monitoring wells were installed.	Complete **up to three soil borings** to the south east and west of the former fuel oil ASTs to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Three Geoprobe borings (ASB-196, ASB-197, ASB-198) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) PCBs (Method 8082) TAL Metals (Method 6010) DRO (Wisconsin Modified Method) GRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) PCBs (Method 8082) TAL Metals (Method 6010), Dissolved DRO (Wisconsin Modified Method) GRO (Wisconsin Modified Method)

Table 1. Summary of Supplemental Phase II-Exterior Investigation Activities
Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Wastewater Collection ASTs Feature 44 North of the wastewater treatment building **Wastewater Treatment Area** Feature 134 Wastewater treatment plant **Former Waste Disposal Area** Feature 140 North of Steam Plant	<u>Wastewater Collection ASTs - Feature 44</u> Three approximate 139,000-gallon wastewater treatment tanks are utilized to store and treat process wastewater generated by the assembly and painting processes at TCAP. The phosphate process generates the majority of the wastewater. Since the ASTs contain and hold process industrial wastewater prior to and during treatment, this area was investigated. <u>Wastewater Treatment Area - Features 134</u> The wastewater treatment area houses operations including transferring, containing, storing, and treating process wastewater generated from the assembly process. Based on current and historic use this area was investigated. <u>Former Waste Disposal Area – Feature 140</u> In what appears to be an isolated disposal incident in 1966, paint waste solvent and sludge was disposed of north of the Steam Plant. Visibly contaminated soils in the area were excavated and sent to a permitted landfill. The reviewed documentation had no analytical data of the material disposed of or description of materials excavated and disposed. <u>Initial Investigation</u>: Four Hollow Stem Auger borings (ASB-023, ASB-024, ASB-025, ASB-027). No temporary monitoring wells were installed.	Complete five **additional soil borings** in the area of the wastewater treatment area to delineate the exceedance of criteria at ASB-027. Four step-out borings will be located approximately 25 feet from ASB-027 and positioned in a manner to delineate the exceedance. In addition, one boring will be co-located with the original ASB-027 location to provide vertical delineation of the exceedance. Convert ASB-027 to a temporary monitoring well and sample groundwater, if sufficient groundwater is present.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Five Geoprobe borings (ASB-188, ASB-189, ASB-190, ASB-191, ASB-192) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes.	Soil: Lead (Method 6010) TCLP Lead Groundwater (Provisional): Lead (Method 6010), Dissolved
Former Hazardous Waste Storage Area Feature 49 Along Eastern Portion of Main Assembly Building	Based on historical documentation reviewed, a former hazardous waste storage area was identified to have been located east of the main assembly building. Based on the general usage of the area to store hazardous waste materials, the former hazardous storage area was investigated. <u>Initial Investigation:</u> Two Hollow Stem Auger borings (ASB-038 and ASB-039). No temporary monitoring wells were installed.	Complete **one soil boring** to provide additional assessment of this feature.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	No soil assessment or sampling was conducted due to construction interference.	None.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) PCBs (Method 8082) TAL Metals (Method 6010) DRO (Wisconsin Modified Method) GRO (Wisconsin Modified Method)

Table 1. Summary of Supplemental Phase II-Exterior Investigation Activities
Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Sludge Pits Feature 121 Western Portion of Paint Building	The paint sludge pits separate overspray from the painting process that is captured by sheeting action of water in trenches underneath the paint booths. The northern paint sludge pit was observed to be in good condition; however, the southern paint sludge pit was currently full of water and could not be inspected. Since the southern pit could not be inspected, the Feature was investigated. The base of the sludge pits is an approximate elevation of 822 feet mean sea level. Initial Investigation: Three Hollow Stem Auger borings (ASB-015, ASB-016, and ASB-032). No temporary monitoring wells were installed.	Complete **two soil borings** in the area of the sludge pits to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	No soil assessment or sampling was conducted due to utility interference. The area will be completed during a future investigation after plant shutdown.	No temporary wells were set due to utility interference.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) TAL Metals (Method 6010) Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) TAL Metals (Method 6010), Dissolved
Former 20,000 Gallon Gasoline AST Feature 138 South of Former Oil House	A former 20,000-gallon gasoline AST was removed from south of the former oil house as identified during interviews with TCAP personnel. Based on the interviewee, when the AST was removed stained soil and odors were identified. However, actions for remediation of the soil were apparently not completed in the area. It is unknown if the AST stored leaded or unleaded gasoline. Initial Investigation: Two Hollow Stem Auger borings (ASB-041 and ASB-042). No temporary monitoring wells were installed.	Complete **two soil borings** in the area of the former 20,000 gallon gasoline AST to provide additional assessment of this feature. Convert one boring to a temporary monitoring well and sample groundwater, if soil impacts extend to groundwater table.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-145, ASB-146	Two Geoprobe borings (ASB-145, ASB-146) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	Temporary groundwater well set and sampled from ASB-145.	Soil: VOCs (Method 8260B) Lead (Method 6010) GRO (Wisconsin Modified Method) Groundwater (Provisional): VOCs (Method 8260B) Lead (Method 6010), Dissolved GRO (Wisconsin Modified Method)
Potential Battery Waste Disposal Area Feature 139 Baseball Diamonds	Based on documentation reviewed the area was potentially used for disposal of battery waste. The MPCA requested a geophysical study in the area; however, no documentation pertaining to additional investigations into Feature 139 was found. Initial Investigation: 30 Geoprobe borings (ASB-049 to ASB-054 and ASB-071 to ASB-094). 39 surface soil samples (AGM-SS-001, to AGM-SS039) collected from 0 to 6 inches below ground surface. Temporary groundwater well set and sampled from ASB-076 and ASB-087.	None.	None.	None.	None.	None.

Table 1. Summary of Supplemental Phase II-Exterior Investigation Activities
Twin Cities Assembly Plant, St. Paul, Minnesota

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Drums Feature 143 Underground Sand Tunnel 1A South and Sand Tunnel 4A	A total of three drums were observed in the sand tunnels. The floor and walls of the sand tunnels consist of sandstone. Two of three drums were empty all drums were rusted and in poor condition with no lids. Staining was not observed in or near the drums observed in these areas. It appeared that the drums may have been historically utilized to mix concrete or mortar. However, due to the presence of the corroded drums of which the former contents is unknown, the area was investigated. Initial Investigation: Two Hand Augers (HA-055, HA-056).	None.	None.	None.	None.	None.
Utility Tunnel Staining Feature 144 Underground Utility Tunnel	Staining was identified on the concrete floor surface within the utility tunnel. The utility tunnel may have been associated with historical Fluid Fill AST tank farm (UST/AST Feature 52) located in or near the former fuel house which contains product piping. Initial Investigation: Two Hand Augers (HA-069, HA-070).	None.	None.	None.	None.	None.
Flow Stone Feature 149 Underground Easternmost Portion of Gas Tunnel	At the east end of the gas tunnel, water was observed to be leaking in from the main assembly building above. The floor and walls of the gas tunnel consist of sandstone. Flow stone was observed on the walls within the gas tunnel. Initial Investigation: One Hand Auger (HA-068).	None.	None.	None.	None.	None.
Potential Film/Staining Feature 151 Underground Sand Tunnels	Several of the mined sand tunnels contain railroad ties (with a limited number having rails still attached) which were used to transport the mined sand from the tunnels for use in the glass manufacturing operations in the main assembly building. A number of these tunnels have had or currently had standing water in them, and a film/staining on the standing water was observed in these areas. The staining may have been related to wood preservation residuals. The film/staining was observed to be dark brown to black in color. Initial Investigation: Seven Hand Augers (HA-057, HA-058, HA-059, HA-060, HA-061, HA-062, HA-063).	None.	None.	None.	None.	None.

	Environmental Concern					
Area of Concern	**Background**	**Supplemental Scope**	**Field Measurements**	**Investigation Activities Conducted**	**Groundwater Assessment**	**Analytical Requirements**
Former Fuel Oil UST Feature 152 East of Central Engineering Office	The 27,000-gallon UST may have been utilized to provide fuel as a heating source in the main assembly building. The UST was installed at an unknown date and no documentation pertaining to its removal was found through research activities; therefore, the UST may still be in place at TCAP. The estimated depth to the base of the former UST is approximately 10 to12 feet bgs. Initial Investigation: Two Hollow Stem Auger borings (ASB-003, ASB-004). Temporary groundwater well set and sampled from ASB-003.	Complete **four soil borings** in the area of the former fuel oil UST to delineate the exceedances of criteria at ASB-003. Four step-out borings will be positioned in a manner to delineate the exceedance. In addition, one boring will be co-located with the original ASB-003 (and converted to **one monitoring well**) location to provide vertical delineation of the exceedance. A groundwater sample will be collected for analysis.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): ASB-135, ASB-147, ASB-148, ASB-163 PID Exceedances (above 10 ppm), entire boring: ASB-163	Four Geoprobe borings (ASB-135, ASB-147, ASB-148, ASB-163) Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	One permanent groundwater well set and sampled from AMW-12.	Soil: VOCs (Method 8260B) PAHs (Method 8270C) GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method) Groundwater: VOCs (Method 8260B) PAHs (Method 8270C) RCRA Metals (Method 6010), Dissolved GRO (Wisconsin Modified Method) DRO (Wisconsin Modified Method)
Former Coal Gasification Plant Feature 153 Near Steam Plant	Historically, a coal gasification plant was located near the steam plant where coal was used to generate gas. The gas was then pumped to the main assembly plant through the gas tunnel. Based on aerial photographs the plant was constructed prior to 1937 and was demolished between 1957 and 1974. Initial Investigation: None.	Complete **four soil borings** to assess subsurface conditions. One soil boring will be completed and converted to a temporary monitoring well adjacent to the river down gradient from the Former Coal Gasification Plant if groundwater is present.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	Two Geoprobe borings (ASB-193, ASB-195) Two soil borings were not completed due to utility interference with gas lines. Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes, and due to utility interference with gas lines.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010) Free Cyanide Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010), Dissolved Free Cyanide
Former Tar Decanter House Feature 154 Near Steam Plant	Historically, a coal gasification plant was located near the steam plant where coal was used to generate gas. The gas was then pumped to the main assembly plant through the gas tunnel. Based on aerial photographs the plant was constructed prior to 1937 and was demolished between 1957 and 1974. Initial Investigation: None.	Complete **four soil borings** to assess subsurface conditions. One soil boring will be completed and converted to a temporary monitoring well adjacent to the river down gradient from the Former Coal Gasification Plant if groundwater is present.	Organic Vapors using a PID. PID Exceedances (above 10 ppm): None.	One Geoprobe borings (ASB-194) Three soil borings were not completed due to accessibility restrictions. Soil assessment and sampling was conducted utilizing the same methodology described in Feature 1 above.	No temporary wells were because groundwater was not encountered in any of the boreholes, and due to accessibility issues.	Soil: VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010) Free Cyanide Groundwater (Provisional): VOCs (Method 8260B) SVOCs (Method 8270C) RCRA Metals (Method 6010), Dissolved Free Cyanide

Area of Concern	Environmental Concern	Field Measurements	Investigation Activities Conducted	Groundwater Assessment	Analytical Requirements
Disposal of Investigation-Derived Waste					
Characterization of Investigation-Derived Waste (IDW)	All soil and groundwater IDW were containerized and properly labeled. One composite soil sample was collected from the soil staging roll off box, and one composite soil sample was collected from soil 55-gallon steel drums.		One soil sample collected from the soil staging roll off box. One soil sample collected from the soil 55-gallon steel drums.	Two water samples taken from the 1000 gallon staging poly tanks.	Base Scope SOIL: TCLP VOCs TCLP SVOCs TCLP RCRA Metals PCBs GROUNDWATER: VOCs (Method 8260) SVOCs (Method 8270) RCRA Metals (Method 6010)

Notes:
1. Investigation Derived Wastes (IDWs): IDWs were managed and disposed in accordance with applicable State regulations. As part of the base scope of work, soil cuttings and purge water was containerized as appropriate, temporarily staged at a location authorized by plant personnel, and disposed at an appropriate off-site facility.
2. Features 35, 36, 37, and 46 were co-located during Phase II exterior field investigation.
3. Features 44, 134, and 140 were co-located during Phase II exterior field investigation.

MONITORING WELL INSTALLATION AND DEVELOPMENT:
Monitoring wells and piezometers shall be installed according to MDH well codes.
All wells completed 5 feet or more in limestone or dolomite will be completed as single cased wells with open bore hole or as double cased wells with stainless steel screens.
All wells materials used for well construction will meet the MDH well codes.
The wells shall be secured with a locking expandable cap.
All wells completed in roadway, sidewalk, driveway, or a parking area will be completed at grade with a flush-mount protective cover set inside a 48-inch square 4-inch thick concrete pad. The concrete pad shall be sloped to facilitate runoff drainage away from the well.
All wells completed in areas other than those listed above will be completed as above grade monitoring wells with a steel protective casing and protective posts as required by MDH wells code.
The wells shall be pad-tagged or otherwise permanently labeled to indicate the well identification.
Each monitoring well shall be developed using typical and appropriate methods. Development water shall be considered an IDW and managed appropriately.
Monitoring wells may be sampled only a minimum of 48 hours after development.

Notes on Page 69.

Table 6A. Summary of Detected Constituents in Group A Soil Samples, Ford Twin Cities Assembly Plant, St. Paul, Minnesota

Acronyms & Abbreviations:

mg/kg	Milligrams per kilogram
mg/L	Milligrams per liter
<	Not detected
ASB	ARCADIS Soil Boring
NA	Not applicable/not analyzed
ND	Not detected
NS	No standard
J	Estimated result
Bold	Detected value
Shade	Result value is above the MPCA Tier 1 Residential SRV
Box	Result value is above the MCPA Tier 2 Industrial SRV
VOCs	Volatile organic compounds
SVOCs	Semi-volatile compounds
PCBs	Polychlorinated biphenyls
SRV	Soil reference value
TCLP	Toxicity characteristic leaching procedure
MPCA	Minnesota Pollution Control Agency
*	Criteria for total xylenes used
**	SRVs are for Chromium VI and Chromium III respectively, reported data is for total chromium and is therefore compared to the lower of the SRVs
***	Reporting limit exceeds standard

Table 6B. Summary of Detected Constituents in Group B Soil Samples, Ford Twin Cities Assembly Plant, St. Paul, Minnesota

Acronyms & Abbreviations:

mg/kg	Milligrams per kilogram
mg/l	Milligrams per liter
<	Not detected
ASB	ARCADIS Soil Boring
NA	Not applicable/not analyzed
ND	Not detected
NS	No standard
J	Estimated result
Bold	Detected value
Shade	Result value is above the MPCA Tier 1 Residential SRV
Box	Result value is above the MCPA Tier 2 Industrial SRV
VOCs	Volatile organic compounds
SVOCs	Semi-volatile compounds
PCBs	Polychlorinated biphenyls
SRV	Soil reference value
TCLP	Toxicity characteristic leaching procedure
MPCA	Minnesota Pollution Control Agency
*	Criteria for total xylenes used
**	SRVs are for Chromium VI and Chromium III respectively, reported data is for total chromium and is therefore compared to the lower of the SRVs
***	Reporting limit exceeds standard

Table 7. Summary of Detected Constituents in Groundwater Samples, Twin Cities Assembly Plant, St. Paul, Minnesota

Acronyms and Abbrevations:

Results are reported in micrograms per liter (ug/l)

AMW	ARCADIS Monitoring Well Location
ASB	ARCADIS Soil Boring
<	Not detected
NA	Not applicable/not analyzed
ND	Not detected
NS	No standard
J	Estimated result
Bold	Detected value
Shade	Value is above the MDH Health Based Water Guidance or EPA Maximum Contaminant Level (MCL) (for arsenic)
HBV	Health Based Value
RAA	Risk Assessment Advice
VOCs	Volatile organic compounds
SVOCs	Semi-volatile compounds
PCBs	Polychlorinated biphenyls
MEK	Methyl ethyl Ketone
*	Criteria for Total Xylenes Used
**	SRVs are for Chromium VI and Chromium III respectively, reported data is for total chromium and is therefore compared to the lower of the SRVs
***	Reporting limit exceeds standard
1	See Benzo(a)pyrene (BaP) Equivalents Action Levels
2	Lead MDH Health Based Water Guidance Actional Level at Tap
ft bgs	Feet below ground surface

Set between 9½ ft. and 14½ ft. FITTINGS thread

OPEN HOLE From _____ ft. To _____ ft.

STATIC WATER LEVEL: 11 ft. ☒ Below ☐ Above land surface Measured from grade Date measured 9/16/11

PUMPING LEVEL (below land surface): _____ ft. after _____ hrs. pumping 4 g.p.m.

WELLHEAD COMPLETION
☐ Pitless/adapter manufacturer _____ Model _____
☐ Casing Protection _____ ☐ 12 in. above grade
☒ At-grade (Environmental Well and Boring ONLY)

GROUTING INFORMATION
Well grouted ☐ Yes ☐ No ☒0
Grout materials ☐ Neat cement ☐ Bentonite ☐ Concrete ☐ Other neat cement bent. x

From 5	To 7 ft.	1	☐ Yds.	☒ Bags
From _____	To _____ ft.	_____	☐ Yds.	☐ Bags
From _____	To _____ ft.	_____	☐ Yds.	☐ Bags

NEAREST KNOWN SOURCE OF CONTAMINATION: _____ feet _____ direction _____ type

Well disinfected upon completion? ☐ Yes ☒ No

PUMP
☒ Not installed Date installed _____
Manufacturer's name _____
Model Number _____ HP _____ Volts _____
Length of drop pipe _____ ft. Capacity _____ g.p.m.
Type: ☐ Submersible ☐ L.S. Turbine ☐ Reciprocating ☐ Jet ☐ _____

ABANDONED WELLS
Does property have any not in use and not sealed well(s)? ☐ Yes ☒ No

VARIANCE
Was a variance granted from the MDH for this well? ☐ Yes ☒ No TN# _____

WELL CONTRACTOR CERTIFICATION
This well was drilled under my supervision and in accordance with Minnesota Rules, Chapter 4725. The information contained in this report is true to the best of my knowledge.

Stevens Drilling & Env. Svc. Inc. 2255

Laboratory submittal: 3199-1
Sample date: 2011-08-22 2011-08-23
Report received by Enovis: 2011-09-16
Initial Data Verification completed by Enovis: 2011-09-19

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

8 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 13470 had detections below the RL for naphthalene and tetrahydrofuran. Client samples -001 and -003 naphthalene results and client samples -001, -002, -003 and -004 tetrahydrofuran results should all be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC LCS recovery for QC batch 13470 tetrahydrofuran was outside of laboratory control limits biased high. This result has been qualified as non-detect at the RL with a UB flag due to associated method blank detections so no further qualification was required based on this high bias QC outlier.

GCMS VOC, GRO and DRO QC batch MS recovery data was not reported due to insufficient sample volume available to perform these matrix specific batch QC analyses.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low for 1 out of 3 acid fraction surrogates in client samples -001 and -006. Since no acid fraction analytes were on the TAL for these samples qualification of client sample results was not required based on the surrogate recovery outliers.

GCMS SVOC MSD recovery and MS/MSD RPD performed on client sample -005 was outside of laboratory control limits with the recovery biased low for dibenzo(a,h)anthracene (note: MS/MSD RPD reported as NC, but would have been an outlier if calculated from MS and MSD data). Client sample -005 result for this analyte should be considered to be estimated and qualified with a UJ flag.

GRO sample -004 was not analyzed due to insufficient methanol available for the sample mass present in the container.

DRO LCS recovery only was an outlier biased low for the QC batch. The LCSduplicate and LCS/LCSD RPD were acceptable so qualification of client sample results was not applied based on the LCS recovery outlier alone.

Metals method blank had a detection below the RL in QC batch 13406 for barium. Qualification of client sample results was not required based on this method blank detection.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantify target analytes for client samples -001 and -006 PNA results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3250-1
Sample date: 2011-08-22 2011-08-23
Report received by Enovis: 2011-09-15
Initial Data Verification completed by Enovis: 2011-09-19

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) and 1 water trip blank were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had detections below the RL for methylene chloride. Client sample -001 methylene chloride results should be considered to be non-detect at the RL and qualified with a UB flag.

PCB LCS recovery for QC batch 13476 was not prepped per project specifications and the re-prep for the LCS as well as the client sample were performed outside of the EPA recommended hold time. The client sample -001 PCB results are considered to be estimated and are qualified with UJ flags.

GCMS SVOC, PCB, GRO and DRO QC batch MS recovery data was not reported due to insufficient sample volume available to perform these matrix specific batch QC analyses.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low for 1 out of 3 base-neutral fraction surrogates in client sample -001. Qualification of client sample results was not required based on this surrogate recovery outlier alone.

GCMS VOC QC batch MS recovery outliers were not performed on sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

GCMS VOC and GRO samples -001 were received at a pH greater than 2. Client sample -001 GRO and GCMS VOC results are considered to be estimated and qualified with J flags if detected and UJ flags if non-detect.

DRO method blank for QC batch 13555 had a detection below the RL. Qualification of client sample results was not required based on this method blank detection.

PCB surrogate recoveries were outside of laboratory control limits biased low for 1 out of 2 surrogates in client sample -001. Qualification of client sample results was not required based on this surrogate recovery outlier alone.

Metals method blank had a detection below the RL in QC batch 13582 for barium. Qualification of client sample results was not required based on this method blank detection.

GCMS VOC trip blank was non-detect for all target analytes.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantify target analytes for client sample -001 GCMS VOC, GCMS SVOC, DRO and GRO results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3201-1
Sample date: 2011-08-23 2011-08-24
Report received by Enovis: 2011-09-16
Initial Data Verification completed by Enovis: 2011-09-19

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

8 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 13470 had detections below the RL for naphthalene and tetrahydrofuran. Client sample -007 naphthalene results and client samples -001, -002, -003, -004 and -009 tetrahydrofuran results should all be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC Trip blank had a detection below the RL for tetrahydrofuran that was qualified as non-detect at the RL with a UB flag as noted above. No other detections were noted for this trip blank.

GCMS VOC LCS recovery for QC batch 13470 tetrahydrofuran was outside of laboratory control limits biased high. These results have been qualified as non-detect at the RL with UB flags due to associated method blank detections so no further qualification was required based on this high bias QC outlier.

GCMS VOC, GRO and DRO QC batch MS recovery data was not reported due to insufficient sample volume available to perform these matrix specific batch QC analyses.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low for 1 out of 3 acid fraction surrogates in client sample -005. Since no acid fraction analytes were on the TAL for these samples qualification of client sample results was not required based on the surrogate recovery outliers.

DRO LCS recovery only for QC batch 13352 was an outlier biased low for the QC batch. The LCSduplicate and LCS/LCSD RPD were acceptable so qualification of client sample results was not applied based on the LCS recovery outlier alone.

GCMS SVOC MSD recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on this sample-matrix specific QC outlier.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantify target analytes for client samples -005, -006 and -008 PNA, GCMS SVOC and GRO results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3228-1
Sample date: 2011-08-24 2011-08-25
Report received by Enovis: 2011-09-28
Initial Data Verification completed by Enovis: 2011-09-29

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

DRO method blank for QC batch 13507 had a detection below the RL. Client samples -002, -003, -004, -005, -006 and -007 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

DRO Continuing Calibration Verification (CCV) standard response associated with samples -004 and -006 was outside of method control limits biased high according to the laboratory submittal case narrative. Since all associated sample results were non-detect qualification was not required.

GCMS VOC, GRO and PCB QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses. GCMS SVOC QC batch MS recovery outliers were not performed on a sample from this submittal.

GCMS VOC batch 13679 method blank had detections below the RL for Naphthalene and tetrahydrofuran. Client sample -001 results for naphthalene and samples -001, -002, -007 and -008 results for tetrahydrofuran should be considered to be non-detect at the RL and qualified with UB flags.

Metals method blank for QC batch 13590 had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

GCMS VOC LCS recovery for QC batch 13679 MIBK was outside of laboratory control limits biased high. Qualification of client sample results was not required based on this high bias QC outlier.

GCMS VOC trip blank had a detection below the RL for tetrahydrofuran that was considered to be non-detect at the RL and qualified with a UB flag due to associated method blank detections. No other detections were reported for the trip blank.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3236-1
Sample date: 2011-08-24 2011-08-25
Report received by Enovis: 2011-09-19
Initial Data Verification completed by Enovis: 2011-09-21

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 13679 had detections below the RL for naphthalene and tetrahydrofuran. Client sample -001 result for naphthalene and client sample -003 result for tetrahydrofuran should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had a detection for tetrahydrofuran that was considered to be non-detect at the RL and qualified with a UB flag. No other detections were reported for this trip blank.

GCMS VOC, GCMS SVOC, DRO and GRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO (C10-C28) method blank had a detection below the RL. Client sample -001 DRO result should be considered to be non-detect at the concentration reported and qualified with a B flag.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantitate target analytes for client sample -002 GCMS VOC and GRO results.

PCB QC batch MS/Surrogate recovery outliers were not performed on a sample from this submittal. Qualification of client sample results was not required based on these sample-matrix specific QC outliers.

GCMS VOC LCS recoveries for QC batch 13679 were outside of laboratory control limits biased high for 4-methyl-2-pentanone. Qualification of client sample results was not required based on this high bias QC outlier.

Metals method blank had a detection below the RL for barium. Qualification of client sample results was not required based on this method blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3264-1
Sample date: 2011-08-23 2011-08-24
Report received by Enovis: 2011-09-19
Initial Data Verification completed by Enovis: 2011-09-21

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Water trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 14331 had a detection below the RL for methylene chloride. Client sample -001 result for this analyte should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS VOC and GRO containers for sample -003 were preserved at a pH level greater than 2. Client sample -003 GCMS VOC and GRO results should all be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect.

GCMS VOC, GCMS SVOC, DRO, GRO and PCB QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO method blank for QC batch 13555 had a detection below the RL. Qualification of client sample results is not required based on this method blank detection.

PCB LCS recovery for QC batch 13725 was outside of laboratory control limits biased low for aroclor 1016. The sample was re-prepped outside of the EPA recommended hold time so the PCB results for QC batch 14650 for client sample -001 should be considered to be estimated and qualified with UJ flags.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantitate target analytes for client sample -001 GCMS VOC results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3301-1
Sample date: 2011-08-25 2011-08-26
Report received by Enovis: 2011-09-26
Initial Data Verification completed by Enovis: 2011-09-28

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Soil sample(s) were analyzed for GCMS SVOC, DRO and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

DRO method blank for QC batch 13702 had a detection below the RL. Client samples -001, -002, -003, -004 DRO results should be considered to be non-detect at the RL and qualified with UB flags. Client sample -005 DRO results should be considered to be non-detect at the concentration reported and qualified with a B flag.

GCMS SVOC MS/MSD RPD's performed on client sample -004 were outside of laboratory control limits for 2-methylnaphthalene, acenaphthene and naphthalene. Qualification of client sample results is not required based on these QC outliers alone.

DRO QC batch 13702 LCS recovery only (LCSDuplicate was acceptable) was outside of laboratory control limits biased high. Qualification of client sample results is not required based on this high bias QC outlier alone.

DRO batch 13702 sequence ending Continuing Calibration Verification (CCV) standard response was outside of method control limits with the bias direction not identified. The laboratory case narrative indicated that associated samples -001, -005 and -006 should be considered to be estimated for DRO. Samples -001 and -005 results are already qualified due to method blank detections but should also be considered to be estimated and qualified with UJ flags. Client sample -006 DRO result should be considered to be estimated and qualified with a J flag. The laboratory case narrative also indicated that the sequence associated with samples -002, -003 and -004 also had a high bias CCV response outlier, however these results are considered to be non-detect due to associated method blank detections so further qualification was not required based on the high bias CCV outlier.

DRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for arsenic, barium and lead. The Selenium MS recovery only was also and outlier biased low. Client sample -001 arsenic, barium and lead results should be considered to be estimated and qualified with J flags. Raw data was not available in the lab submittal to determine if the 4X rule may apply.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantitate target analytes for client samples -006 GCMS SVOC results and client sample -006 DRO results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3303-1
Sample date: 2011-08-25 2011-08-26
Report received by Enovis: 2011-09-22
Initial Data Verification completed by Enovis: 2011-09-23

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

3 Water sample(s) and 1 field duplicate were analyzed for GCMS VOC, GCMS SVOC, PCB, DRO, GRO and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 14331 had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this method blank detection.

GCMS VOC trip blank was non-detect for all target analytes tested.

GRO containers for sample -003 were preserved at a pH level greater than 2. Client sample -003 GRO results should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC, DRO, GRO and PCB QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO method blank for QC batch 13555 had a detection below the RL. Qualification of client sample results is not required based on this method blank detection.

PCB LCS recovery was outside of laboratory control limits biased low for aroclor 1016 in QC batch 14095. The samples were re-prepped outside of the EPA recommended hold time in QC batch 14744 so the PCB results for client samples -001, -003, -004 and -005 re-analyses should be considered to be estimated and qualified with UJ flags. Note: the results for the initial analyses of PCB's were included on the laboratory report but the data is not available in the Ford database.

Metals method blank had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

WI Gasoline Range Organics (C6-C10)	E-1005		ND	100	ug/l	UJ																

GRO containers for sample -003 were preserved at a pH level greater than 2. Client sample -003 GRO results should be considered to be estimated and qualified with a UJ flag.

PCB LCS recovery was outside of laboratory control limits biased low for aroclor 1016 in QC batch 14095. The samples were re-prepped outside of the EPA recommended hold time in QC batch 14744 so the PCB results for client samples -001, -003, -004 and -005 re-analyses should be considered to be estimated and qualified with UJ flags. Note: the results for the initial analyses of PCB's were included on the laboratory report but the data is not available in the Ford database.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3396-1
Sample date: 2011-08-26 2011-08-29
Report received by Enovis: 2011-09-29
Initial Data Verification completed by Enovis: 2011-09-30

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for naphthalene. Client sample -004 result for this analyte should be considered to be non-detect at the RL and qualified with a UB flag.

DRO method blank had a detection below the RL. Client sample -007 DRO results should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS VOC, GRO and DRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

Metals method blank had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

GCMS VOC trip blank was non-detect for all target analytes.

Reporting limits were elevated due to dilutions required to overcome sample matrix interferences or quantitate target analytes for GCMS SVOC samples -002 and -005, GRO samples -002, -003 and -004 and DRO samples -002 and -005.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3400-1
Sample date: 2011-08-29
Report received by Enovis: 2011-09-22
Initial Data Verification completed by Enovis: 2011-09-23

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) was analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Water trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had detections below the RL for methylene chloride, naphthalene, hexachlorobutadiene and 1,2,3-trichlorobenzene. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC trip blank was non-detect for all target analytes tested.

GRO and PCB QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

GCMS VOC and GCMS SVOC QC batch MS data was not performed using a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

DRO method blank had a detection below the RL. Client sample -001 DRO result should be considered to be non-detect at the RL and qualified with a UB flag.

DRO LCS/LCSduplicate RPD was outside of laboratory control limits. Qualification of client sample results is not required based on this QC outlier alone.

DRO Continuing Calibration Verification (CCV) standard response was outside of method control limits biased high for the sequence beginning CCV. All associated results from this submittal were non-detect so were not affected by the high bias and qualification was not required.

Metals method blank had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3401-1
Sample date: 2011-08-29 2011-08-30
Report received by Enovis: 2011-09-23
Initial Data Verification completed by Enovis: 2011-09-27

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Soil sample(s) were analyzed for GCMS VOC, GC VOC, GC Other and Metals parameter(s). 1 Soil sample was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for Naphthalene. Client sample -003 results for this analyte should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS VOC QC batch 141012, DRO and GRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO method blank had a detection below the RL. Client sample -002 DRO result should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS VOC trip blank had detections below the RL for naphthalene, toluene and m/p-xylenes. Client sample -001 m/p-xylene results should be considered to be non-detect at the RL and qualified with a UB flag. The Naphthalene result in the trip blank was considered to be non-detect at the RL and qualified with a UB flag as noted above due to method blank detections.

The laboratory case narrative indicated that the GCMS VOC frozen encore containers had thawed during transit from the Pittsburgh to North Canton laboratories. The prep date was therefore considered to be the date received at the North Canton laboratory which was outside of the 48 hour recommended holding time for all three samples. Client samples -001, -002 and -003 GCMS VOC results should all be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3402-1
Sample date: 2011-08-30
Report received by Enovis: 2011-09-26
Initial Data Verification completed by Enovis: 2011-09-28

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

5 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for Naphthalene. Client sample -005 results for this analyte should be considered to be non-detect at the RL and qualified with a UB flag.

GMS VOC QC batch 14142, DRO and GCMS SVOC QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO method blank for QC batch 14012 had a detection below the RL. Client samples -002, -003, -004 and -005 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank was non-detect for all target analytes.

The laboratory case narrative indicated that the GCMS VOC frozen encore containers had thawed during transit from the Pittsburgh to North Canton laboratories. The prep date was therefore considered to be the date received at the North Canton laboratory which was still less than the 48 hour recommended holding time for all three samples. Qualification of client sample results was not applied based on this sample receipt information alone.

DRO Continuing Calibration Verification (CCV) standard response was outside of method control limits biased high according to the laboratory submittal case narrative. Since all associated sample results were non-detect qualification was not required.

Metals method blank for QC batch 14055 had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.
The laboratory case narrative also indicated that the metals sequence CCB had a detection above the RL for silver. Raw data for the CCB was not provided but the case narrative noted that qualification was not required.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3408-1
Sample date: 2011-08-30 2011-08-31
Report received by Enovis: 2011-09-23
Initial Data Verification completed by Enovis: 2011-09-27

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for Naphthalene. Client samples -004, -007 and -008 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC QC batch 141142, DRO and GRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

DRO method blank had a detection below the RL. Client samples -006 and -007 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had a detection below the RL for naphthalene. The Naphthalene result in the trip blank was considered to be non-detect at the RL and qualified with a UB flag as noted above due to method blank detections.

GCMS SVOC MSD recovery performed on client sample -004, was outside of laboratory control limits biased low for dibenzo(a,h)anthracene. The MS/MSD RPD was also an outlier. Client sample -004 result for this analyte should be considered to be estimated and qualified with a UJ flag.

The laboratory case narrative indicated that the GCMS VOC frozen encore containers had thawed during transit from the Pittsburgh to North Canton laboratories. The prep date was therefore considered to be the date received at the North Canton laboratory which was still less than the 48 hour recommended holding time for all three samples. Qualification of client sample results was not applied based on this sample receipt information alone.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3454-1
Sample date: 2011-09-01 2011-08-30 2011-08-31
Report received by Enovis: 2011-09-23
Initial Data Verification completed by Enovis: 2011-09-27

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) was analyzed for GCMS VOC, GC VOC and Metals parameter(s). 1 Water trip blank was analyzed for GCMS VOC parameters.
11 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 14890 had a detection below the RL for Naphthalene. Client samples -002, -003 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC method blank for QC batch 15099 had a detection below the RL for Methylene chloride. Qualification of client sample results is not required based on this method blank detection.

GCMS VOC QC batch 14890, GCMS SVOC, DRO and GRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses.

GCMS VOC soil trip blank was non-detect for all target analytes tested. GCMS VOC water trip blank had a detection below the RL for methylcyclohexane. Qualification of client sample results was not required based on this trip blank detection.

GCMS VOC sample -007 MS/MSD recoveries were outside of laboratory control limits biased high for 1,1,2-trichloroethane. One MS only and the MS/MSD RPD were outliers with the recovery biased low for dichlordifluoromethane. Methylcyclohexane recovery was not considered to be reliable and was not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule). Client sample -007 dichlorodifluoromethane results should be considered to be estimated and qualified with a UJ flag. The methylcyclohexane results were greater than the upper working calibration range of the instrument (CCV also an outlier biased high) so should be considered to be estimated and qualified with an E flag.

GCMS VOC samples -010 and -011 containers were received with suspected methanol leaks so the associated analysis was not performed.

GCMS SVOC QC batch 14528 method blank had detections below the RL for bis-2-ethylhexylphthalate, caprolactam and di-n-butylphthalate. Client samples -003, -004, -009, -010 and -011 bis-2-ethylhexylphthalate and samples -004 and -009 di-n-butylphthalate results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC LCS recoveries for QC batch 14528 were outside of laboratory control limits biased low for 2,4-dinitrophenol and 4,6-dinitro-2-methylphenol. Client samples -002, -003, -004, -005, -006, -009, -010, -011, -012 results for these analytes should be considered to be estimated and qualified with UJ flags.

PCB batch 14434 Continuing Calibration Verification (CCV) standard response was outside of method control limits biased high. The identity of the aroclor outlier was not provided in the laboratory case narrative but since all associated sample results were non-detect qualification was not required.

DRO method blank for QC batch 14286 had a detection below the RL. Client samples -002, -003, -004, -009, -010, -011, -012 and -013 DRO result should be considered to be non-detect at the RL and qualified with UB flags.

DRO QC batch 14286 LCS recovery and LCS/LCSduplicate RPD were outside of laboratory control limits with the recovery biased low. Client samples -005 and -006 DRO results should be considered to be estimated and qualified with J flags.

Metals method blank for QC batch 14392 had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biase high for chromium. This metal was not a target analyte for the sample so qualification was not required. The Lead recovery was an outlier high along with an MS/MSD RPD outlier so client sample -001 Lead results should be considered to be estimated and qualified with a J flag. Raw data was not available in the lab submittal to determine if the 4X rule may apply.

Percent moisture duplicate RPD was an outlier for client sample -006, but the percent solids RPD was acceptable. Since this data is only being used for dry weight correction the moisture duplicate outlier did not translate into the need for qualification of client sample results.

Reporting limits were elevated due to dilutions required to either overcome sample matrix interferences or quantitate target analytes for client samples -002, -005, -006 and -012 GCMS SVOC results and client sample -007 GRO results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3519-1
Sample date: 2011-09-01 2011-09-02
Report received by Enovis: 2011-09-28
Initial Data Verification completed by Enovis: 2011-09-29

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC and GC Other parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

DRO method blank had a detection below the RL. Client sample -002 DRO results should be considered to be non-detect at the RL and qualified with a UB flag and client sample -007 DRO result should be considered to be non-detect at the concentration reported and qualified with a B flag.

DRO Continuing Calibration Verification (CCV) standard response was outside of method control limits biased high according to the laboratory submittal case narrative. Since all associated sample results were non-detect qualification was not required.

DRO QC batches did not include matrix spike data due to insufficient sample available to perform MS/MSD analyses. GCMS SVOC QC batch MS recovery outliers were not performed on a sample from this submittal.

GCMS VOC batch 15010 and batch 14890 method blanks had detections below the RL for Naphthalene. Client samples -001, -002 -003, -005 and -007 results for naphthalene should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had detections below the RL for toluene and m+p-xylenes. Client samples -001, -002 and -003 toluene results and samples -002 and -007 m+p-xylenes results should be considered to be non-detect at the RL and qualified with a UB flags. No other detections were reported for the trip blank.

GRO Continuing Calibration Verification (CCV) standard response for QC batch 16334 was outside of method control limits biased high according to the laboratory submittal case narrative. Since all associated sample results were non-detect qualification was not required.

GCMS VOC MS/MSD RPD performed on client sample -005 was outside of laboratory control limits for acetone. Qualification of client sample results was not required based on this QC outlier alone.

GCMS SVOC QC batch MS recovery outliers were not performed on a sample from this submittal. Qualification of client sample results was not required based on this sample-matrix specific QC outlier.

GRO MS recoveries performed on client sample -005 were outside of laboratory control limits biased low. The MS/MSD RPD was also an outlier. Client sample -005 GRO result should be considered to be estimated and qualified with a J flag.

GRO LCS recovery for QC batch 14847 was outside of laboratory control limits biased high. Client samples -003, -004, -005, -006 and -007 original analyses GRO results should all be considered to be estimated and qualified with J flags.

GRO samples -003, -004, -005 and -006 were re-analyzed outside of the recommended holding time of 14 days. These results should all be considered to be estimated and qualified with J flags (QC batch 16548).

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3596-1
Sample date: 2011-09-06 2011-09-07
Report received by Enovis: 2011-09-30
Initial Data Verification completed by Enovis: 2011-10-04

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

11 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results for Soil samples have been reported on a dry weight basis.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blanks for QC batches 14890 and 15010 had detections below the RL for naphthalene. Client samples -002, -005, -006, -007, -011 and -012 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -003. Client samples -003 results for isopropylbenzene, methylcyclohexane, n-butylbenzene, n-propylbenzene and sec-butylbenzene should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the base-neutral fraction surrogates in client sample -003. Sample was analyzed at a 1 to 4 dilution. All base-neutral fraction analytes should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. The designation of estimated rather than unusable was assigned due to the dilution near the 5X level that is used as the cutoff for unreliable surrogate recovery data and comparison to historical/associated results for this matrix at this site.

GCMC SVOC MS/MSD recoveries performed on client sample -007 were diluted to below reliably quantifiable levels and were not used to qualify client sample results.

GRO analysis for client sample -003 was performed outside of the recommended holding time for the re-analysis. The re-analysis GRO result for client sample -003 should be considered to be estimated and qualified with a J flag.

GRO MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high. The sample is already qualified as estimated due to being present below the RL so no further qualification is required.

PCB surrogate recoveries were outside of laboratory control limits biased high for 1 out of 2 surrogates in client sample -008. Qualification of client sample results was not required based on this QC outlier alone.

GCMS VOC QC batch 14890 and PCB batch did not have sufficient sample available to create MS/MSD spikes.

DRO MS recoveries performed on client sample -005 were not considered to be reliable and were not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule).

DRO CCV response was outside of method control limits biased high for the sample -002 sequence. Qualification of client sample results was not required as all associated results were less than the RL.

Metals method blank had detections below the RL for antimony, barium, lead, manganese and potassium in QC batch 15003 and potassium in QC batch 15517. Client samples -008 and -012 antimony results should be considered to be non-detect at the concentration reported and qualified with B flags.

Metals MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for antimony. Client sample -003 antimony result should be considered to be estimated and qualified with a UJ flag. Potassium and chromium MS recovery outlier only did not require qualification. Recoveries for manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high for cadmium (RPD also an outlier). Chromium MSD and MS/MSD RPD were also outliers with the recovery biased high. Client sample -001 cadmium and chromium results should be considered to be estimated and qualified with UJ flags. Magnesium and Barium MS recovery outliers only did not require qualification. Recoveries for lead, calcium, antimony, manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

GCMS VOC trip blank was non-detect for all target analytes except methyl acetate. Client samples -001, -002, -005, -006, -007, -008, -010, -011 and -012 results for methyl acetate should be considered to be non-detect at the RL and qualified with UB flags.

Solids duplicate RPD outlier for client sample -001 did not require qualification as the associated percent solids RPD was acceptable.

Reporting limits were elevated due to dilutions required to overcome sample matrix interferences or quantitate target analytes for client sample -003 GCMS VOC results, sample -001, -003, -007, -008 and -010 GCMS SVOC results, sample -001, -003 and -005 DRO results and sample -011 Metals results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia, Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

Qualified Results Summary

Enovis Project ID: E200572
Laboratory: TestAmerica - North Canton
Laboratory Submittal: 3596-1

		Sample Name:	ASB-167_8-10(20110906)				ASB-167_0-2(20110906)			
		Lab Sample ID:	2401514810				2401514817			
		Sample Date:	9/6/2011				9/6/2011			
	Analyte	**Cas No.**	**Result**	**Report Limit**	**Units**	**Valid Qualifier**	**Result**	**Report Limit**	**Units**	**Valid Qualifier**
GC VOC										
	PUBL-SW-140									
	WI Gasoline Range Organics (C6-C10)	E-1005								
Metals										
	OSW-6010B									
	Antimony	7440-36-0								
	Cadmium	7440-43-9								
	Chromium	7440-47-3								

GCMS VOC method blanks for QC batches 14890 and 15010 had detections below the RL for naphthalene. Client samples -002, -005, -006, -007, -011 and -012 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -003. Client samples -003 results for isopropylbenzene, methylcyclohexane, n-butylbenzene, n-propylbenzene and sec-butylbenzene should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the base-neutral fraction surrogates in client sample -003. Sample was analyzed at a 1 to 4 dilution. All base-neutral fraction analytes should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. The designation of estimated rather than unusable was assigned due to the dilution near the 5X level that is used as the cutoff for unreliable surrogate recovery data and comparison to historical/associated results for this matrix at this site.

GRO analysis for client sample -003 was performed outside of the recommended holding time for the re-analysis. The re-analysis GRO result for client sample -003 should be considered to be estimated and qualified with a J flag.

Metals method blank had detections below the RL for antimony, barium, lead, manganese and potassium in QC batch 15003 and potassium in QC batch 15517. Client samples -008 and -012 antimony results should be considered to be non-detect at the concentration reported and qualified with B flags.

Metals MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for antimony. Client sample -003 antimony result should be considered to be estimated and qualified with a UJ flag. Potassium and chromium MS recovery outlier only did not require qualification. Recoveries for manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high for cadmium (RPD also an outlier). Chromium MSD and MS/MSD RPD were also outliers with the recovery biased high. Client sample -001 cadmium and chromium results should be considered to be estimated and qualified with UJ flags. Magnesium and Barium MS recovery outliers only did not require qualification. Recoveries for lead, calcium, antimony, manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

GCMS VOC trip blank was non-detect for all target analytes except methyl acetate. Client samples -001, -002, -005, -006, -007, -008, -010, -011 and -012 results for methyl acetate should be considered to be non-detect at the RL and qualified with UB flags.

	Antimony	7440-36-0								
	Cadmium	7440-43-9								
	Chromium	7440-47-3								

GCMS VOC method blanks for QC batches 14890 and 15010 had detections below the RL for naphthalene. Client samples -002, -005, -006, -007, -011 and -012 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -003. Client samples -003 results for isopropylbenzene, methylcyclohexane, n-butylbenzene, n-propylbenzene and sec-butylbenzene should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the base-neutral fraction surrogates in client sample -003. Sample was analyzed at a 1 to 4 dilution. All base-neutral fraction analytes should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. The designation of estimated rather than unusable was assigned due to the dilution near the 5X level that is used as the cutoff for unreliable surrogate recovery data and comparison to historical/associated results for this matrix at this site.

GRO analysis for client sample -003 was performed outside of the recommended holding time for the re-analysis. The re-analysis GRO result for client sample -003 should be considered to be estimated and qualified with a J flag.

Metals method blank had detections below the RL for antimony, barium, lead, manganese and potassium in QC batch 15003 and potassium in QC batch 15517. Client samples -008 and -012 antimony results should be considered to be non-detect at the concentration reported and qualified with B flags.

Metals MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for antimony. Client sample -003 antimony result should be considered to be estimated and qualified with a UJ flag. Potassium and chromium MS recovery outlier only did not require qualification. Recoveries for manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high for cadmium (RPD also an outlier). Chromium MSD and MS/MSD RPD were also outliers with the recovery biased high. Client sample -001 cadmium and chromium results should be considered to be estimated and qualified with UJ flags. Magnesium and Barium MS recovery outliers only did not require qualification. Recoveries for lead, calcium, antimony, manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

GCMS VOC trip blank was non-detect for all target analytes except methyl acetate. Client samples -001, -002, -005, -006, -007, -008, -010, -011 and -012 results for methyl acetate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -003. Client samples -003 results for isopropylbenzene, methylcyclohexane, n-butylbenzene, n-propylbenzene and sec-butylbenzene should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the base-neutral fraction surrogates in client sample -003. Sample was analyzed at a 1 to 4 dilution. All base-neutral fraction analytes should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. The designation of estimated rather than unusable was assigned due to the dilution near the 5X level that is used as the cutoff for unreliable surrogate recovery data and comparison to historical/associated results for this matrix at this site.

GRO analysis for client sample -003 was performed outside of the recommended holding time for the re-analysis. The re-analysis GRO result for client sample -003 should be considered to be estimated and qualified with a J flag.

Metals method blank had detections below the RL for antimony, barium, lead, manganese and potassium in QC batch 15003 and potassium in QC batch 15517. Client samples -008 and -012 antimony results should be considered to be non-detect at the concentration reported and qualified with B flags.

Metals MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for antimony. Client sample -003 antimony result should be considered to be estimated and qualified with a UJ flag. Potassium and chromium MS recovery outlier only did not require qualification. Recoveries for manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high for cadmium (RPD also an outlier). Chromium MSD and MS/MSD RPD were also outliers with the recovery biased high. Client sample -001 cadmium and chromium results should be considered to be estimated and qualified with UJ flags. Magnesium and Barium MS recovery outliers only did not require qualification. Recoveries for lead, calcium, antimony, manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

GCMS VOC trip blank was non-detect for all target analytes except methyl acetate. Client samples -001, -002, -005, -006, -007, -008, -010, -011 and -012 results for methyl acetate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC method blanks for QC batches 14890 and 15010 had detections below the RL for naphthalene. Client samples -002, -005, -006, -007, -011 and -012 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -003. Client samples -003 results for isopropylbenzene, methylcyclohexane, n-butylbenzene, n-propylbenzene and sec-butylbenzene should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the base-neutral fraction surrogates in client sample -003. Sample was analyzed at a 1 to 4 dilution. All base-neutral fraction analytes should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. The designation of estimated rather than unusable was assigned due to the dilution near the 5X level that is used as the cutoff for unreliable surrogate recovery data and comparison to historical/associated results for this matrix at this site.

GRO analysis for client sample -003 was performed outside of the recommended holding time for the re-analysis. The re-analysis GRO result for client sample -003 should be considered to be estimated and qualified with a J flag.

Metals method blank had detections below the RL for antimony, barium, lead, manganese and potassium in QC batch 15003 and potassium in QC batch 15517. Client samples -008 and -012 antimony results should be considered to be non-detect at the concentration reported and qualified with B flags.

Metals MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for antimony. Client sample -003 antimony result should be considered to be estimated and qualified with a UJ flag. Potassium and chromium MS recovery outlier only did not require qualification. Recoveries for manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased high for cadmium (RPD also an outlier). Chromium MSD and MS/MSD RPD were also outliers with the recovery biased high. Client sample -001 cadmium and chromium results should be considered to be estimated and qualified with UJ flags. Magnesium and Barium MS recovery outliers only did not require qualification. Recoveries for lead, calcium, antimony, manganese, iron, aluminum were not used to qualify results due to the 4X rule noted earlier.

GCMS VOC trip blank was non-detect for all target analytes except methyl acetate. Client samples -001, -002, -005, -006, -007, -008, -010, -011 and -012 results for methyl acetate should be considered to be non-detect at the RL and qualified with UB flags.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3605-1
Sample date: 2011-09-06 2011-09-07
Report received by Enovis: 2011-09-30
Initial Data Verification completed by Enovis: 2011-10-04

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

5 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Soil trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blanks for QC batches 14890 and 15029 had detections below the RL for naphthalene. Client samples -001 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC QC batch 14890 and GRO batch did not have sufficient sample available to create MS/MSD spikes.

GCMS VOC GCMS SVOC and DRO MS/MSD recovery outliers were not performed on samples from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

DRO sample -005 was not analyzed. See laboratory case narrative for details.

DRO CCV response was outside of method control limits biased high for the sample -001 sequence. Qualification of client sample results was not required as all associated results were less than the RL.

Metals method blank had detections below the RL for barium, calcium, manganese and potassium. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC method blank was non-detect for all target analytes.

Reporting limits were elevated due to dilutions required to overcome sample matrix interferences or quantitate target analytes for client sample -001 GCMS VOC results, sample -004 and -005 GCMS SVOC results, sample -002 and -005 GRO results and sample -004 DRO results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Laboratory: TestAmerica - North Canton
Laboratory submittal: 4162-1
Sample date: 2011-09-06 2011-09-14 2011-09-22
Report received by Enovis: 2011-10-11
Initial Data Verification completed by Enovis: 2011-10-13

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s), 1 trip blank and 1 equipment blank were analyzed for combinations of GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this method blank detection.

Trip blank was non-detect for all GCMS VOC target analytes.

Equipment blank had detections below the RL for acetone, MEK, toluene and DRO. Qualification of client sample results in this submittal were not required based on these equipment blank detections.

GCMS VOC QC batch MS recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

GCMS SVOC prep for sample -002 was received by the lab and performed outside of the EPA recommended holding time. Client sample -002 PNA results should be considered to be estimated and qualified with UJ flags.

GCMS SVOC, DRO and GRO QC batches did not have sufficient client sample available to create MS/MSD spikes.

DRO prep for sample -002 was received by the lab and performed outside of the EPA recommended holding time. Client sample -002 DRO results should be considered to be estimated and qualified with a J flag (also already present below RL).

GRO CCV response for QC batch 16677 was outside of method control limits biased high for the sample sequence. Qualification of client sample results was not required as associated results were less than the RL or non-detect.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

22226 Garrison, Dearborn MI 48124 (313) 871-5800

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3807-1
Sample date: 2011-09-07 2011-09-09 2011-09-12
Report received by Enovis: 2011-10-13
Initial Data Verification completed by Enovis: 2011-10-16

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water trip blank sample(s) was analyzed for GCMS VOC parameter(s).
25 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GRO, DRO, Metals and General Chemistry parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following significant QC anomalies were identified during verification of the analytical report:

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.
Surrogate recoveries for client sample -027 were diluted to below reliably quantifiable levels and were not used to qualify results.

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 15984 and GCMS SVOC QC batch 16115 MS/MSD analyses was not performed on a sample from this submittal so qualification of client sample results was not required based on this sample-matrix specific QC outlier.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS VOC trip blank was non-detect for all target analytes.

GCMS VOC surrogate recoveries were diluted to below reliably quantifiable levels and were not used to qualify results for client sample -002.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC LCS recovery high bias outlier for bis-2-ethylhexylphthalate did not require qualification for client sample results as the associated results for this analyte were already qualified as non-detect at the RL due to method blank contamination.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

GCMS SVOC re-analyses for client samples -003, -006, -007, -008, -009 and -010 were prepped outside of the EPA recommended hold time. These results should all be considered to be estimated and qualified with UJ flags if non-detect and J flags if detected. Note: the re-analysis data was not included in the laboratory EDD so is not available in the CLMS Ford database.

GRO and DRO surrogate recovery data was not included with the laboratory submittal.

GRO and DRO MS/MSD recovery data performed on client sample -002 was diluted to below reliably quantifiable levels and was not used to qualify results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

PCB surrogate recoveries were outside of laboratory control limits biased low for 2 out of 2 surrogates in QC sample -003MS. Qualification of client sample results was not required based on these surrogate recovery outliers.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags. MS or MSD recovery outliers only but not both for potassium did not require qualification of client sample results. MS recoveries for aluminum, manganese, iron, zinc and lead were not considered to be reliable and not used to qualify results due to elevated levels of target analyte relative to the amount spiked (4X rule).

Reporting limits were elevated due to dilutions required to overcome sample matrix interferences or quantify target analytes for client sample -002 GCMS VOC results, client samples -026, -027 and -029 GCMS SVOC results, client sample -004 GRO results, client samples -002 and -005 DRO results and client sample -005 metals results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags.

GCMS SVOC surrogate recoveries for client sample -010 original analysis were outside of laboratory control limits biased low and less than 10% for 1 out of 3 of the acid fraction surrogates. Client sample -010 original analysis acid fraction analytes should be considered to be unusable and qualified with R flags if non-detect and J flags if detected.

GCMS VOC MS/MSD recoveries performed on client sample -028 were outside of laboratory control limits biased low for diethylether. Client sample -028 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -003, -006, -007, -008, -009 and -010 results for bis-2-ethylhexylphthalate and samples -003 and -006 results for di-n-butylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for 3,3-dichlorobenzidine and hexachlorocyclopentadiene. Client sample -003 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol and 2,4-dinitrophenol did not require qualification for client sample results.

DRO QC batch 15710 method blank had a detection below the RL. Client samples -001 and -010 DRO results should be considered to be non-detect at the RL and qualified with UB flags.

PCB MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for aroclors 1016 and 1260. Client sample -003 results for these aroclors should be considered to be estimated and qualified with UJ flags.

Metals method blank for QC batch 15660 had detections below the RL for arsenic, barium, calcium, potassium, magnesium and manganese. Qualification of client sample results was not required based on these method blank detections. Method blank for QC batch 15941 had a detection below the RL for lead. Client samples -012, -017 and -020 Lead results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for antimony and calcium. Client sample -002 results for antimony and calcium should be considered to be estimated and qualified with J flags. MS/MSD recoveries for barium and chromium were outliers with one recovery biased low and one biased high along with MS/MSD RPD outliers. Client sample -002 barium and chromium results should be considered to be estimated and qualified with J flags.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 3692-1
Sample date: 2011-09-08
Report received by Enovis: 2011-10-13
Initial Data Verification completed by Enovis: 2011-10-16

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Solid sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Solid trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 14890 MS/MSD analyses were not performed due to insufficient sample volume available.

GCMS VOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane and 2-hexanone. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD recoveries for methylacetate, bromoform, ethylbenzene, tert-butylbenzene were outliers biased high. Methyl acetate results for client sample -001 is already considered to be estimated and qualified with a J flag due to being present below the RL. Only one of the MS/MSD recoveries was an outlier biased low for 1,2-dibromoethane, 4-chlorotoluene, MIBK, bromomethane and chlorodibromomethane and biased high for 1,2,4-trimethylbenzene. Qualification of client sample results was not required based on these QC outliers alone. MS/MSD recoveries were not considered to be reliable and were not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule) for isopropylbenzene, methylcyclohexane, naphthalene, n-butylbenzene, n-propylbenzene and sec-butylbenzene. MS/MSD RPD's were outliers for toluene, tert-butylbenzene and methylacetate in addition to the recovery outliers noted above but qualification was not required based on these RPD outliers alone.

GCMS VOC method blanks for QC batches 14890 and 15029 had detections below the RL for naphthalene. Client samples -003 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had detections below the RL for methylacetate and toluene. Client samples -003, -004, -005, -006 and -007 methyl acetate results should be considered to be non-detect at the RL and qualified with UB flags. Client sample -001 Toluene result should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS VOC surrogate recoveries were diluted to below reliably quantifiable levels and were not used to qualify results for client sample -002.

GCMS VOC surrogate recoveries were outside of laboratory control limits biased high for 1 out of 4 surrogates in client sample -008 and the QC batch MS. Associated analytes are already qualified as estimated due to being present below the RL so further qualification was not required based on this high bias surrogate outlier.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -004, -005, -006 and -007 results for bis-2-ethylhexylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC LCS recovery high bias outlier for bis-2-ethylhexylphthalate did not require qualification for client sample results as the associated results for this analyte were already qualified as non-detect at the RL due to method blank contamination.

GCMS SVOC MS/MSD recoveries performed on client sample -006 were outside of laboratory control limits biased low for 2,4-dinitrophenol, 4-nitrophenol and only one MS biased low along with the MS/MSD RPD for hexachlorocyclopentadiene. Client sample -006 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD RPD outliers for 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol, caprolactam and pentachlorophenol did not require qualification for client sample results.

GCMS SVOC MS/MSD recovery outliers for QC batch MS18046 were not performed on a sample from this submittal so qualification was not applied based on these sample-matrix specific QC outliers.

GCMS SVOC re-analyses for client samples -004, -005, -006 and -007 were prepped outside of the EPA recommended hold time. These results should all be considered to be estimated and qualified with UJ flags if non-detect and J flags if detected. Note: the re-analysis data was not included in the laboratory EDD so is not available in the CLMS Ford database.

GRO Continuing Calibration Verification (CCV) standard for sequence 16677 was an outlier biased high. The laboratory report case narrative indicated that there were no detectable sample results associated with this high bias calibration check so qualification was not required.

GRO and DRO surrogate recovery data was not included with the laboratory submittal.

GRO and DRO MS/MSD recovery data performed on client sample -001 was not considered to be reliable and not used to qualify results due to elevated levels of target analyte relative to the amount spiked (4X rule).

DRO LCS or LCSduplicate recoveries and the LCS/LCSduplicate RPD were outliers with the recovery biased low. Client samples -001, -002, -003, -004, -005, -006 and -007 should all be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

PCB QC batch MS/MSD recovery outliers were not performed on a sample from this submittal so qualification of client sample results is not required based on these sample-matrix specific QC outliers.

Metals method blank for QC batch 15306 had detections above the RL for iron and below the RL for aluminum, barium, calcium, potassium and manganese. Qualification of client sample results was not required based on these method blank detections.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for antimony and copper. Client sample -001 results for antimony and copper should be considered to be estimated and qualified with J flags. MS or MSD recovery outliers only but not both for calcium, magnesium and manganese did not require qualification of client sample results. MS recoveries for aluminum, barium, iron, zinc, lead and mercury were not considered to be reliable and not used to qualify results due to elevated levels of target analyte relative to the amount spiked (4X rule).

Reporting limits were elevated due to dilutions required to overcome sample matrix interferences or quantify target analytes for client sample -001 and -002 GCMS VOC and DRO results, client sample -004 GCMS SVOC results, client sample -001 mercury results.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

OSW-6010B									
Antimony	7440-36-0								
Copper	7440-50-8								

GCMS VOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane and 2-hexanone. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD recoveries for methylacetate, bromoform, ethylbenzene, tert-butylbenzene were outliers biased high. Methyl acetate results for client sample -001 should be considered to be estimated and qualified with a J flag.

GCMS VOC method blanks for QC batches 14890 and 15029 had detections below the RL for naphthalene. Client samples -003 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had detections below the RL for methylacetate and toluene. Client samples -003, -004, -005, -006 and -007 methyl acetate results should be considered to be non-detect at the RL and qualified with UB flags. Client sample -001 Toluene result should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -004, -005, -006 and -007 results for bis-2-ethylhexylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -006 were outside of laboratory control limits biased low for 2,4-dinitrophenol, 4-nitrophenol and only one MS biased low along with the MS/MSD RPD for hexachlorocyclopentadiene. Client sample -006 results for these analytes should be considered to be estimated and qualified with UJ flags.

DRO LCS or LCSduplicate recoveries and the LCS/LCSduplicate RPD were outliers with the recovery biased low. Client samples -001, -002, -003, -004, -005, -006 and -007 should all be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for antimony and copper. Client sample -001 results for antimony and copper should be considered to be estimated and qualified with J flags.

GCMS SVOC MS/MSD recoveries performed on client sample -006 were outside of laboratory control limits biased low for 2,4-dinitrophenol, 4-nitrophenol and only one MS biased low along with the MS/MSD RPD for hexachlorocyclopentadiene. Client sample -006 results for these analytes should be considered to be estimated and qualified with UJ flags.

DRO LCS or LCSduplicate recoveries and the LCS/LCSduplicate RPD were outliers with the recovery biased low. Client samples -001, -002, -003, -004, -005, -006 and -007 should all be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

Metals MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for antimony and copper. Client sample -001 results for antimony and copper should be considered to be estimated and qualified with J flags.

GCMS VOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane and 2-hexanone. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags. MS/MSD recoveries for methylacetate, bromoform, ethylbenzene, tert-butylbenzene were outliers biased high. Methyl acetate results for client sample -001 should be considered to be estimated and qualified with a J flag.

GCMS VOC method blanks for QC batches 14890 and 15029 had detections below the RL for naphthalene. Client samples -003 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had detections below the RL for methylacetate and toluene. Client samples -003, -004, -005, -006 and -007 methyl acetate results should be considered to be non-detect at the RL and qualified with UB flags. Client sample -001 Toluene result should be considered to be non-detect at the RL and qualified with a UB flag.

GCMS SVOC method blank for QC batch 16114 had detections below the RL for bis-2-ethylhexylphthalate and di-n-butylphthalate. Client samples -004, -005, -006 and -007 results for bis-2-ethylhexylphthalate should be considered to be non-detect at the RL and qualified with UB flags.

GCMS SVOC MS/MSD recoveries performed on client sample -006 were outside of laboratory control limits biased low for 2,4-dinitrophenol, 4-nitrophenol and only one MS biased low along with the MS/MSD RPD for hexachlorocyclopentadiene. Client sample -006 results for these analytes should be considered to be estimated and qualified with UJ flags.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5494-1
Sample date: 2011-10-31
Report received by Enovis: 2011-11-23
Initial Data Verification completed by Enovis: 2011-11-28

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

3 Water sample(s) and 1 field duplicate were analyzed for GCMS VOC, GCMS SVOC, GC VOC, DRO and Metals parameter(s). 1 Water trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC MS/MSD recoveries performed on client sample -004 were outside of laboratory control limits biased high for 1,1,2-trichloroethane and the MSD recovery only was biased high for methylcyclohexane. Qualification of client sample results was not required based on these high bias QC outliers.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low but greater than 10% for 1 out of 3 surrogates in client sample -002. Qualification of client sample results was not required based on this surrogate recovery outlier alone.

GCMS SVOC QC batch MS recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

DRO and GRO QC information did not include batch MS/MSD recovery data or sample/QC recovery data. The laboratory report case narrative did not elaborate on these omissions.

Metals method blank had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

GCMS VOC trip blank had a detection below the RL for acetone. Client samples -001, -003 and -004 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5690-1
Sample date: 2011-11-07
Report received by Enovis: 2011-12-09
Initial Data Verification completed by Enovis: 2011-12-12

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

4 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for acetone. Client samples -003, -004 and -005 acetone results should all be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had a detection for acetone that was qualified as non-detect at the RL due to associated method blank detections. There were no other detections for the trip blank.

GCMS VOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for tert-butylbenzene. Client sample -003 results for this analyte should be considered to be estimated and qualified with a UJ flag. Ethyl benzene and p,m-xylenes MS or MSD recoveries but not both were outliers biased high so qualification was not required based on these QC outliers alone.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low but greater than 10% for 1 out of 3 base-neutral fraction surrogates in client samples -001, -003, -004 and the MS for -003 and the MSD for -003RE. Qualification of client sample results was not required based on these QC outliers alone.

GCMS SVOC MS/MSD reanalysis for client sample -003 were prepared outside of the EPA recommended hold time. GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for the following analytes which should all be considered to be estimated and qualified with UJ flags:
2,4-dinitrophenol, 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene (RPD outlier also), benzo(ghi)perylene, butylbenzylphthalate, caprolactam, chrysene (RPD outlier also), di-n-octylphthalate, dibenzo(ah)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, n-nitrosodinpropylamine, pentachorophenol and pyrene.
The following analytes should be considered to be estimated and qualified with a J flag:
bis-2-ethylhexylphthalate.
MS or MSD recoveries only but not both were outliers biased low for benzo(k)fluoranthene, dinbutylphthalate, hexachlorobenzene and 4nitroaniline. Hexachloroethane recovery was biased high. Qualification of client sample results was not required based on these recovery outliers alone.

PCB surrogate recoveries were outliers biased low and less than 10% for 1 out of 2 surrogates in client sample -003RE and -003 original analysis. The re-analysis was prepped outside of the EPA recommended hold time so these results should be considered to be estimated and qualified with UJ flags. The original analysis was associated with MS/MSD spike concentrations that were not according to the method/project requirements. The MS/MSD re-analyses were prepped outside of the EPA recommended holding time and included MSD recovery outlier for aroclor 1016 and MS/MSD RPD outliers for aroclor 1016 and 1260.

DRO MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased high. Client sample -003 DRO results should be considered to be estimated and qualified with J flags.

GRO MS/MSD recoveries performed on client sample -003 were diluted to below reliably quantifiable levels and were not used to qualify client sample results.

GRO and DRO sample data did not include the associated surrogate recoveries.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

	WI Diesel Range Organics (C10-C28)	E-1004	1.1	0.10	mg/l	J								

GCMS VOC method blank had a detection below the RL for acetone. Client samples -003, -004 and -005 acetone results should all be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for tert-butylbenzene. Client sample -003 results for this analyte should be considered to be estimated and qualified with a UJ flag.

GCMS SVOC MS/MSD reanalysis for client sample -003 were prepared outside of the EPA recommended hold time. GCMS SVOC MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased low for the following analytes which should all be considered to be estimated and qualified with UJ flags:

2,4-dinitrophenol, 3,3-dichlorobenzidine, 4,6-dinitro-2-methylphenol, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene (RPD outlier also), benzo(ghi)perylene, butylbenzylphthalate, caprolactam, chrysene (RPD outlier also), di-n-octylphthalate, dibenzo(ah)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, n-nitrosodinpropylamine, pentachorophenol and pyrene.
The following analytes should be considered to be estimated and qualified with a J flag:
bis-2-ethylhexylphthalate.

PCB surrogate recoveries were outliers biased low and less than 10% for 1 out of 2 surrogates in client sample -003RE and -003 original analysis. The re-analysis was prepped outside of the EPA recommended hold time so these results should be considered to be estimated and qualified with UJ flags. The original analysis was associated with MS/MSD spike concentrations that were not according to the method/project requirements. The MS/MSD re-analyses were prepped outside of the EPA recommended holding time and included MSD recovery outlier for aroclor 1016 and MS/MSD RPD outliers for aroclor 1016 and 1260.

DRO MS/MSD recoveries performed on client sample -003 were outside of laboratory control limits biased high. Client sample -003 DRO results should be considered to be estimated and qualified with J flags.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5702-1
Sample date: 2011-11-04
Report received by Enovis: 2011-11-30
Initial Data Verification completed by Enovis: 2011-12-02

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s).
1Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for naphthalene. Client samples -001, -002 and -005 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank was non-detect for all target analytes tested.

GCMS SVOC surrogate recoveries were diluted to below reliably quantifiable levels and were not used to qualify results for client sample -003.

GCMS SVOC MS/MSD RPD was an outlier for benzo(b)fluoranthene in client sample -004. Qualification of client sample results was not required based on this QC outlier alone.

GRO MS/MSD RPD was an outlier in client sample -004. Qualification of client sample results was not required based on this QC outlier alone.

Metals method blank had detections below the RL for barium, calcium, potassium, magnesium, manganese, silver and nickel. Qualification of client sample results was not required based on these method blank detections.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Naphthalene	91-20-3		16	250	ug/kg	UB	13	270	ug/kg	UB	8.4	270	ug/kg	UB

GCMS VOC method blank had a detection below the RL for naphthalene. Client samples -001, -002 and -005 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5704-1
Sample date: 2011-11-07
Report received by Enovis: 2011-11-30
Initial Data Verification completed by Enovis: 2011-12-01

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Water trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC trip blank had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this trip blank detection.

GCMS VOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for tert-butylbenzene, ethylbenzene and 1,2,4-trimethylbenzene. Client sample results for these analytes should be considered to be estimated and qualified with a J flag if detected and UJ flag if non-detect. The MSD recovery outlier only for m&p-xylenes did not result in qualification of client sample data.

GCMS SVOC, DRO and GRO QC batch MS recovery outliers were not performed on samples from this submittal. Qualification of client sample results was not required based on these sample-matrix specific QC outliers.

GCMS SVOC sample -001 results for naphthalene and 2-methylnaphthalene for the initial analysis were greater than the upper calibration range of the analytical instrument and were considered to be estimated and qualified with E flags. The re-analysis data did not require qualification. The original E flagged data was not included in the laboratory EDD so is not available in the database.

Metals method blank had a detection below the RL for barium. Qualification of client sample results is not required based on this method blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5928-1
Sample date: 2011-11-11
Report received by Enovis: 2011-11-30
Initial Data Verification completed by Enovis: 2011-12-02

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) and 1 field duplicate were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 24524 had detections below the RL for 1,2,3-trichlorobenzene, methylene chloride and naphthalene. Client sample -004 (trip blank) results for these analytes should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank detections for 1,2,3-trichlorobenzene, naphthalene and methylene chloride were qualified as non-detect at the RL due to associated method blank detections. No other detections were reported in the trip blank.

GCMS VOC client samples -002 and -003 and GRO client samples -001, -002 and -003 containers were received at a pH of greater than 2 so were outside of the recommended preservation criteria for the standard 14 day holding time. The associated analyses were performed within 7 days of sample collection so qualification was not required based on the preservation non-conformances.

GCMS SVOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for benzo(a)anthracene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(a)pyrene, chrysene, dibenzo(ah)anthracnene (MS/MSD RPD also an outlier) and indeno(1,2,3-cd)pyrene. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags. MS only recovery outliers for benzo(k)fluoranthene and pyrene did not result in qualification of client sample data.

DRO method blank detection below the RL did not result in qualification for client sample data.

Metals method blank had detections below the RL for potassium, barium, arsenic, beryllium, calcium, magnesium, manganese and zinc. Client samples -001, -002 and -003 arsenic and beryllium results should be considered to be non-detect at the RL and qualified with UB flags.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant – drums and roll-off IDW
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5936-1
Sample date: 2011-11-11
Report received by Enovis: 2011-12-08
Initial Data Verification completed by Enovis: 2011-12-09

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Solid sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

The following minor QC exceptions or missing information were noted:

Metals method blank had a detection below the RL for barium. Qualification of client sample results was not required based on this method blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 7777-1
Sample date: 2012-01-17
Report received by Enovis: 2012-01-31
Initial Data Verification completed by Enovis: 2012-02-02

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s), 1 field duplicate and client assigned samples for MS/MSD were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for 1,2,3-trichlorobenzene. Qualification of client sample results was not required based on this method blank detection.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low for 1 out of 3 surrogates in client sample -001 MSD QC sample. Qualification of client sample results is not required based on this surrogate recovery outlier alone.

GCMS SVOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for benzo(a)anthracene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(a)pyrene, (MS/MS RPD also an outlier) chyrsene, dibenzo(ah)anthracene, indeno(1,2,3-cd)pyrene. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags.
MS recoveries only were outliers for benzo(k)fluoranthene, fluoranthene and pyrene so these analytes did not require qualification.

DRO LCS/LCSDUPLICATE RPD was an outlier for QC batch 30867. Qualification of client sample results was not required based on this QC outlier alone.

Metals method blank had detections below the RL for barium, calcium, potassium, magnesium and manganese. Qualification of client sample results is not required based on these method blank detections.

GCMS VOC trip blank had detections below the RL for acetone and methylene chloride. Client samples -002 acetone results and sample -003 methylene chloride results should be considered to be non-detect at the RL and qualified with UB flags.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 11587-1
Sample date: 2012-05-21 2012-05-22
Report received by Enovis: 2012-06-07
Initial Data Verification completed by Enovis: 2012-06-08

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Solid sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC Other and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank had a detection below the RL for dichlorodifluoromethane. Client samples -001, -002 and -003 results for this analyte should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC LCS recoveries were outside of laboratory control limits biased high for vinyl chloride. Qualification of client sample results was not required based on this high bias QC outlier.

GCMS SVOC QC batch MS recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

Metals method blank had detections below the RL for barium, calcium, iron, potassium and manganese. Qualification of client sample results was not required based on these method blank detections.

Metals MS recoveries performed on client sample -001 were outside of laboratory control limits biased high with the MS/MSD RPD also an outlier for manganese and biased low with the MS/MSD RPD also an outlier for magnesium. Client sample -001 magnesium and manganese results should be considered to be estimated and qualified with J flags. Aluminum, calcium and iron MS recoveries were not considered to be reliable and were not used to qualify results due to elevated levels of target analytes in the original sample matrix relative to the amount spiked (4X rule).

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 11623-1
Sample date: 2012-05-22 2012-05-23
Report received by Enovis: 2012-06-15
Initial Data Verification completed by Enovis: 2012-06-18

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC Other and Metals parameter(s).
5 Solid sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC Other and Metals parameter(s). 1 Trip blank sample was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 45549 method blank had a detection below the RL for dichlorodifluoromethane. Client samples -004 and -005 dichlorodifluoromethane results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC QC batch 45501 method blank had detections below the RL for 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, hexachlorobutadiene and above the RL for methylene chloride. QC batch 46002 method blank had detections below the RL for 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, hexachlorobutadiene. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC trip blank was non-detect for all target analytes.

GCMS VOC QC batch 45549 LCS recoveries were outside of laboratory control limits biased high for vinyl chloride and QC batch 45501 biased high for 1,1,2-trichloroethane and QC batch 46002 biased high for 1,1,2-trichloroethane and 1,2-dibromoethane. Qualification of client sample results was not required based on these high bias QC outliers.

GCMS VOC sample -007 container appeared to be leaking methanol preservative according to the laboratory submittal case narrative. This sample was also prepped from the bulk container that was not stored exclusively as a VOC sample so there was potential for cross contamination. The sample results were all non-detect for GCMS VOC so qualification was not applied based on this sample preservation information. Sample -001 container was not preserved to below pH of 2 but was analyzed in less than 7 days from collection so qualification was not required based on this preservation outlier.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 base-neutral fraction surrogates in client sample -001. Client sample -001 GCMS SVOC base-neutral fraction analytes should be considered to be unusable and qualified with R flags if non-detect and estimated with J flags if detected. Sample re-analysis results were not available.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low but greater than 10% for 1 out of 3 base-neutral fraction surrogates in client sample -002. Qualification of client sample results was not required based on this QC outlier alone.

GCMS SVOC MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for several target analytes. Please reference the attached Qualified Analytical Results summary for target analytes considered to be estimated and qualified with UJ flags if non-detect and J flags if detected.

GCMS SVOC QC batch 46255 MS recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

GCMS SVOC internal standard outliers were present for samples -006, -007 and -008 according to the laboratory submittal case narrative. Qualification of client sample results could not be made based on the internal standard outlier information provided.

PCB surrogate recoveries were outside of laboratory control limits biased low for 2 out of 2 surrogates in client sample -001 and 1 out of 2 surrogates in client sample -002 and its matrix spike. Client sample -001 PCB results should be considered to be estimated and qualified with UJ flags.

PCB MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for aroclor 1016. Client sample -002 aroclor 1016 results should be considered to be estimated and qualified with a UJ flag.

DRO QC batch method blank had a detection below the RL. Client sample -002 DRO results should be considered to be non-detect at the concentration reported and qualified with a UB flag.

Metals method blank for QC batch 45326 had detections below the RL for barium, calcium, iron, potassium, manganese and zinc. QC batch method blank had detections below the RL for calcium, magnesium and potassium. Qualification of client sample results was not required based on these method blank detections.

Metals MS recovery and MS/MSD RPD performed on client sample -004 were outside of laboratory control limits with the recovery biased high for chromium. Client sample -004 chromium result should be considered to be estimated and qualified with a J flag.

Note: Surrogate recovery data was not available for DRO analyses.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia, Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

GCMS VOC QC batch 45549 method blank had a detection below the RL for dichlorodifluoromethane. Client samples -004 and -005 dichlorodifluoromethane results should be considered to be non-detect at the RL and qualified with **UB** flags.

GCMS SVOC surrogate recoveries were outside of laboratory control limits biased low and less than 10% for 1 out of 3 base-neutral fraction surrogates in client sample -001. Client sample -001 GCMS SVOC base-neutral fraction analytes should be considered to be unusable and qualified with **R** flags if non-detect and estimated with **J** flags if detected. Sample re-analysis results were not available.

GCMS SVOC MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for several target analytes. Please reference the attached Qualified Analytical Results summary for target analytes considered to be estimated and qualified with **UJ** flags if non-detect and **J** flags if detected.

PCB surrogate recoveries were outside of laboratory control limits biased low for 2 out of 2 surrogates in client sample -001 and 1 out of 2 surrogates in client sample -002 and its matrix spike. Client sample -001 PCB results should be considered to be estimated and qualified with **UJ** flags.

PCB MS/MSD recoveries performed on client sample -002 were outside of laboratory control limits biased low for aroclor 1016. Client sample -002 aroclor 1016 results should be considered to be estimated and qualified with a **UJ** flag.

DRO QC batch method blank had a detection below the RL. Client sample -002 DRO results should be considered to be non-detect at the concentration reported and qualified with a **UB** flag.

Metals MS recovery and MS/MSD RPD performed on client sample -004 were outside of laboratory control limits with the recovery biased high for chromium. Client sample -004 chromium result should be considered to be estimated and qualified with a **J** flag

Analytical Results Summary

Enovis Project ID: E200572
Laboratory: TestAmerica - North Canton
Laboratory Submittal: 11623-1

		Sample Name:	ASB-209_10-12(20120523)				ASB-209_5-6.5(20120523)				HA-208_0-2(20120523)			
		Lab Sample ID:	240116234				240116235				240116236			
		Sample Date:	5/23/2012				5/23/2012				5/23/2012
