NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Bold print denotes control parameters

a Spiked analyte recovery is outside stated control limits.

p Relative percent difference (RPD) is outside stated control limits.

Injection Source and Location

Injection Source: HP GC Injector

Injection Location: Front

North Canton 1099

HP6890 GC METHOD

OVEN
- Initial temp: 140 'C (On)
- Initial time: 0.50 min
- Ramps:

#	Rate	Final temp	Final time
1	15.00	150	1.00
2	20.00	300	1.00
3	0.0(Off)		

- Post temp: 0 'C
- Post time: 0.00 min
- Run time: 10.67 min
- Maximum temp: 325 'C
- Equilibration time: 1.00 min

FRONT INLET (UNKNOWN)
- Mode: Splitless
- Initial temp: 225 'C (On)
- Pressure: 9.50 psi (On)
- Purge flow: 40.0 mL/min
- Purge time: 0.75 min
- Total flow: 67.1 mL/min
- Gas saver: Off
- Gas type: Hydrogen

BACK INLET ()

COLUMN 1
- Capillary Column
- Model Number: RESTEK CLP2
- CLP2
- Max temperature: 320 'C
- Nominal length: 30.0 m
- Nominal diameter: 520.00 um
- Nominal film thickness: 0.42 um
- Mode: constant pressure
- Pressure: 9.50 psi
- Nominal initial flow: 20.2 mL/min
- Average velocity: 163 cm/sec
- Inlet: Front Inlet
- Outlet: Front Detector
- Outlet pressure: ambient

COLUMN 2
- (not installed)

FRONT DETECTOR (μECD)
- Temperature: 325 'C (On)
- Mode: Constant makeup flow
- Makeup flow: 60.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Electrometer: On

BACK DETECTOR (μECD)
- Temperature: 325 'C (On)
- Mode: Constant makeup flow
- Makeup flow: 60.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Electrometer: On

Run/Project Information

Run Date: 3-18-08 Analyst: ML Instrument: H4

Prep Batches Run: See Run Log

Circle Methods used: (7470A / 245.1 : CORP-MT-0005 Rev 1) 7471 / 245.1 : CORP-MT-0007 Rev 1

Review Items

A. Calibration/Instrument Run QC	Yes	No	N/A	2nd Level
1. Instrument calibrated per manufacturer's instructions and at SOP specified levels?	✓			✓
2. ICV/CCV analyzed at appropriate frequency and within control limits?	✓			✓
3. ICB/CCB analyzed at appropriate frequency and within +/- RL?	✓			✓
4. CRA run?	✓			✓
B. Sample Results				
1. Were samples with concentrations > high calibration standard diluted and reanalyzed?	✓			✓
2. All reported results bracketed by in control QC?	✓			✓
3. Sample analyses done within holding time?	✓			✓
C. Preparation/ Matrix QC				
1. LCS done per prep batch and within QC limits?	✓			✓
2. Method blank done per prep batch and < RL?	✓			✓
3. MS run at required frequency and within limits?	✓			✓
4. MSD or DU run at required frequency and RPD within SOP limits?	✓			✓
D. Other				
1. Are all nonconformances documented appropriately?	✓			✓
2. Current IDL/MDL data on file?	✓			✓
3. Calculations and Transcription checked for error?	✓			✓
4. All client/project specific requirements met?	✓			✓
5. Date of analysis verified as correct?	✓			✓

Test America North Canton ICP Data Review Checklist

Run/Project Information:

Run Date: 3.12.08 **Analyst:** LRW **Instrument:** I 5

Prep Batches Run: SEE RUN LOG

Circle Methods used: (6010B / 200.7:) CORP-MT-0001 Rev 3.2
6010A/200.7: CORP-MT-0001NC, Rev 2

Review Items

A. Calibration/Instrument Run QC	Yes	No	N/A	2nd Level
1. Instrument calibrated per manufacturer's instructions (2 exposures/sample) and at SOP specified levels ?	✓			✓
2. ICV/CCV analyzed at appropriate frequency and within control limits ? *(ICV (2nd source):200.7=95 –105%, 6010B 90-110%) (CCV: 90 – 110%)*	✓			✓
3. ICB/CCB analyzed at appropriate frequency and within +/- RL ?	✓			✓
4. High Std. (HCAL) reanalyzed before samples and recovered within QC limits ? (6010A only 95-105%)			✓	
5. CRI run at SOP or project-specific frequency? Recovered within QC limits? (6010A +/- 50%, project specific limits may vary)	✓			✓
6. ICSA/ICSAB run at required frequency and within SOP limits ?	✓			✓
B. Sample Results				
1. Were samples with concentrations > the linear range for any parameter diluted and reanalyzed ?	✓			✓
2. All reported results bracketed by in control QC ?	✓			✓
3. Sample analyses done within holding time ?	✓			✓
C. Preparation/Matrix QC				
1. LCS done per prep batch and within QC limits ?	✓			✓
2. Method blank done per prep batch and < RL ?	✓			✓
3. MS/MSD run at required frequency and within limits ?	✓			✓
4. MSD or DU run at required frequency and RPD within SOP limits ?	✓			✓
5. Serial dilution done per prep batch ?	✓			✓
6. Post digest spike analyzed if required?			✓	
D. ther				
1. Are all nonconformances documented appropriately ?	✓			✓
2. Current IDL/MDL/LR/IEC data on file ?	✓			✓
3. Calculations checked for error ?	✓			✓
4. Transcriptions checked for error ?	✓			✓
5. All client/project specific requirements met ?	✓			✓
6. Date/time of analysis verified as correct ?	✓			✓

Nonconformance Memo

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

NCM #: 01-10836
NCM Initiated By: Dorothy Leeson
Date Opened: 03/05/2004
Date Closed: 03/08/2004

Classification: Anomaly
Status: CLOSED
Production Area: Metals
Tests: None
Lot #'s (Sample #'s): ,
QC Batches: None.,

Nonconformance: Other (describe in detail)
Subcategory: Other (explanation required)

Problem Description / Root Cause

Name	Date	Description
Dorothy Leeson	03/05/2004	Stock standard solutions used for ICP ICSA solutions commonly have low level contamination for certain elements, especially zinc.

Verified contamination is not corrected by interelement correction factors (IECs) since instrumental determination of the presence of the analyte is due not to spectral interference but due to actual presence of the element in the solution. Contamination can be verified by performing a wavelength scan of the standard solution. If contamination exists, the peak apex will be directly at the expected wavelength for the element of concern. If the presence of the analyte is due to interference from another analyte which produces a peak near the element of concern, the peak apex of the interfering analyte will not be exactly at the wavelength for the element of concern, and an IEC would be generated.

If contamination for an element such as zinc is suspected, an IEC would be inappropriate, and the concentration during analysis of the daily ICSA solution may exceed SOP criteria. In these cases, this NCM will be referenced and a copy of this NCM will be included with the run.

Zinc contamination in ICSA stock solutions has been verified in this lab at various times with wavelength scans. Similarly, contamination for other elements has been verified when suspected. An example scan is included with the I6 ICP analytical run from 4/3/01.

Corrective Action

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: 8C13254
Sample date: 2008-03-11
Report received by Enovis: 2008-03-26
Initial Data Verification completed by Enovis: 2008-04-04

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample was analyzed for GCMS VOC, GCMS SVOC, PCB, Wisconsin GRO, Wisconsin DRO and Metals parameters and 1 Trip Blank for GCMS VOC parameters. Refer to the attached Sampling and Analysis Summary table.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Equipment blank associated with this sample event was reported in submittal A8C130246. Equipment Blank results were reported above the MDL. Refer to the minor QC exception listed below.

Analytical results reported between the MDL and RDL are flagged J and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC LCS for 4-Methyl-2-pentanone, trans-1,3-Dichloropropene and 1,1,2,2-Tetrachloroethane recovered low outside of the labs acceptance window in QC batch 8079081. The LCSD recovered in control. The LCS/LCSD RPD was in
control. No qualification required.

GCMS VOC LCSD for Tetrachloroethene, 1,1,2-Trichloro-1,2,2,-trifluoroethane and Trichlorofluoromethane recovered high outside of the labs acceptance window in QC batch 8079081. The LCS recovered in control. The LCS.LCSD RPD was in control. No qualification required.

GCMS VOC MS/MSD for 2-Hexanone recovered low outside of the labs acceptance window in QC batch 8079081. The sample was project specific A8C130254-001. The sample result was reported non-detect and is flagged UJ and considered estimated.

GCMS VOC MS/MSD for 1,1,2-Trichloro-1,2,2-trifluoroethane recovered high outside of the labs acceptance window in QC batch 8079081. The sample was project specific A8C130254-001. The sample result was reported non-detect. No qualification required.

GCMS VOC MS for cis-1,3-Dichloropropene, 1,1-Dichloroethane, 1,1,2,2-Tetrachloroethane, Vinyl chloride, 1,2-Dichloropropane and 4-Methyl-2-pentanone recovered low outside of the labs acceptance window in QC batch 8079081. The MSD recovered in control. The MS/MSD RPD was in control. The sample was project specific A8C130254-001. No qualification required.

GCMS VOC MSD for Tetrachloroethene recovered slightly (1%) high outside of the labs acceptance window in QC batch 8079081. The MS recovered in control. The MS/MSD RPD was in control. The sample was project specific A8C130254-001. No qualification required.

GCMS VOC Method Blank for Acetone and 1,2,3-Trichlorobenzene were reported between the MDL and RDL in QC batch 8079081. The Acetone concentration reported in the Trip Blank was higher than the method blank. The associated field sample result for A8C130254-001 was reported non-detect. No qualification required. The 1,2,3-Trichlorobenzene concentration in the Trip Blank was slightly less than the method blank concentration. The associated field sample result for A8C130254-001 was reported non-detect. No qualification required.

GCMS VOC Trip Blank reported Methyl ethyl ketone, Methylcyclohexane and Naphthalene results between the MDL and RDL. The associated results for A8C130254-001 were reported non-detect. No qualification required.

GCMS SVOC Surrogates for the method blank in QC batch 8074037 did not recover. The lab re-extract and re-analyzed the associated samples in QC batch 8079104. The sample surrogates recovered in control in both the initial and re-extracts. The lab reported both sets of analyses. The re-extraction occurred 1 day outside of hold time. Enovis recommends that the results from the initial sample analysis be considered acceptable. The re-extract results are flagged R to indicate which results to report.

GCMS SVOC LCS for 1,1-Biphenyl recovered slightly (3%) low outside of the labs acceptance window in QC batch 8074037. The project specific MS/MSD for A8C130254-001 recovered in control. No qualification required.

GCMS SVOC LCS for Caprolactam recovered low outside of the labs acceptance window in QC batch 8079104. The associated sample results were reported non-detect. The sample results associated with this QC batch are not being reported. If the results from the re-extract were reported then the result would be flagged UJ and considered estimated.

GCMS VOC Equipment Blank for Acetone and Methyl ethyl ketone were reported between the MDL and RDL. The associated sample results for A8C130256-001 were reported non-detect. No qualification required.

GCMS SVOC MS/MSD for Caprolactam recovered low outside of the labs acceptance window in QC batch 8079104. The associated sample results were reported non-detect. The sample results associated with this QC batch are not being reported. If the results from the re-extract were reported then the result would be flagged UJ and considered estimated.

GCMS SVOC MS/MSD RPD for bis(2-Chloroethyl)ether was above the labs acceptance limit in QC batch 8074037. Both the MS and MSD recovered in control. No qualification required.

GCMS SVOC MS/MSD RPD for 4-Chloroanaline was above the labs acceptance limit in QC batch 8079104. Both the MS and MSD recovered in control. No qualification required.

GCMS SVOC Method Blank for bis(2-Ethylhexyl)phthalate was reported between the MDL and RDL in QC batch 8074037. The associated result for A8C130254-001 was reported between the MDL and RDL and less than 10x the method blank concentration and is flagged UB and considered non-detect at the RDL.

PCB Equipment Blank reported a concentration between the MDL and RDL for PCB-1260. The associated sample result for A8C130256-001 was reported non-detect. No qualification required.

DRO Surrogate recovered high outside of the labs acceptance window in samples A8C130254-001 and the associated method blank. The surrogate recovery for this method is only advisory. Qualification is not based on surrogate recovery. The method blank reported a concentration between the MDL and RDL. The Equipment Blank reported a concentration slightly higher than the method blank. The result for A8C130254-001 was less than 5x the Equipment Blank concentration and is flagged UB and considered non-detect at the RDL.

Metals Method Blank for Barium was reported between the MDL and RDL in QC batch 8074016. The associated sample result for A8C130254-001 was reported between the MDL and RDL and greater than 10x the method blank concentration and is flagged J as an estimated value. No further qualification required.

Evaluation of blank contamination includes directions on the interpretation of the affected analytical results; however it is beyond the scope of Enovis verification to apply changes to the result and quantitation limit in the Ford Master Analytical database. The end data user must implement any corrections to the electronic data downloaded from the Enovis CLMS based on project requirements.

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than
>	Greater than
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

TABLE 7	SAMPLE HOLDING TIME AND PRESERVATION REQUIREMENTS

LIST OF ATTACHMENTS

ATTACHMENT A	CHAIN OF CUSTODY DOCUMENT(S)

1.0 INTRODUCTION

The following document details an assessment of analytical data reported by TestAmerica-North Canton for water samples collected from Ford Twin Cities Assembly. The samples were collected March 11, 2008. A sampling and analysis summary is presented in Table 1. A summary of the analytical data is presented in Table 3. Copies of sample Chain of Custody (COC) documents and cooler receipt forms for samples discussed in this report are included in Attachment A.

This data review covers a single analytical report submitted under the following cover:

Laboratory Submittal	***Sample Date***	***Laboratory Receipt Date***
A8C130254	3/11/2008	3/13/2008

The samples were analyzed for one or more of the following:

Parameter	***Reference Method***	***Comment***
Volatile Organics	OSW-8260B	
Semi-Volatile Organics	OSW-8270C	
PCBs	OSW-8082	
GRO	WI-GRO	
DRO	WI-DRO	
Dissolved Metals	OSW-6010B	
Dissolved Mercury	OSW-7471A	

All "OSW" analytical methods were referenced from "Test Methods for Evaluating Solid Wastes, Physical/Chemical Methods", Third Edition, November 1986 (with all subsequent revisions). "APHA" methods were referenced from "Standard Methods for the Examination of Water and Wastewater", 18th Edition, 1992. "EMSLC" methods were referenced from "Methods for Chemical Analysis of Water and Wastes" EPA-600/4-79-020, March 1983 (with all subsequent revisions).

Some method references included in the analytical reports did not match the method references cited in the Electronic Data Deliverable (EDD), however the methods cited were equivalent and both cited as references in laboratory SOPs. Method citations in this report cite the methods referenced in EDD.

A Level 4 data review was performed on the data by Enovis, Inc (Enovis). A review of 100 percent of the data, which allows for complete independent data review without reconstruction of analytical data, was conducted. Approximately 10 percent of the data underwent a comprehensive or extensive review which allowed for complete reconstruction of the chemical analysis. A table of the laboratory documents reviewed in preparing this report is included in Table 2. The data was reviewed in accordance with the analytical methods and the documents entitled:

i.) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", EPA 540/R-99/008, October 1999;

ii.) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review", EPA 540/R-94/013, February 1994; and

The Level 4 review findings are presented in the following subsections.

An overview of the review findings is presented in table format. Several data qualifier flags were utilized in the review process. The definitions of these qualifier flags are as follows:

- J Indicates an estimated value.
- U Indicates the compound or analyte was analyzed for, but not detected at or above the stated limit.
- UJ The analyte/compound was not detected above the reported sample quantitation limit. However, the quantitation limit is considered to be approximate due to associated quality assurance results.
- UB The analyte was detected in the sample at a level between the MDL and RDL. For organics the sample concentration for common lab contaminates was less than 10 times the blank concentration or 5x for other organic compounds and for inorganics the sample concentration was less than 10 times the blank concentration. The sample result should be considered non-detect at the reporting limit.
- B The analyte was detected in the sample at a level above the RDL. For organics the sample concentration for common lab contaminates was less than 10 times the blank concentration or 5x for other organic compounds and for inorganics the sample concentration was less than 10 times the blank concentration. The sample result should be considered non-detect at the reporting limit.

All flags have been incorporated into the data tables in this report.

2.0 VOLATILE ORGANIC COMPOUNDS (VOCs)

2.1 GAS CHROMATOGRAPH/MASS SPECTORMETER (GC/MS) CALIBRATION – VOCs

2.1.1 TUNING AND MASS CAILBRATION

Prior to analysis GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, the VOC method requires the analysis of the specific tuning compound Bromofluorobenzene (BFB). The resulting spectra must meet the criteria cited in the method before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Instrument tuning data were reviewed. Tuning compounds were analyzed at the required frequency throughout the VOC analysis periods. All tuning criteria were met for the analyses, indicating proper optimization of the instrumentation.

2.1.2 INITIAL CALIBRATION

A multi-point point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific calibration range. Calibration data including the documented integrity of standards used for all quantitated analysis were reviewed for all samples. Linearity of the calibration curve and instrument sensitivity were evaluated against the following criteria:

i.) All average relative response factors (RRFs) must be greater than or equal to 0.01 (lab criteria - not a method specific criteria); all method specific requirements for SPCC responses for selective compounds are met; and

ii.) All response factors are stable over the concentration range of the calibration with a percent relative standard deviation (%RSD) of less than 15% for linearity to be assumed, else appropriate calibration curve correlation coefficients must be not less than 0.990 and not forced through the origin; and method specific CCC criteria for selective compounds are met.

iii.) If instrument response for analyte is considered to be typically non-linear lab must have protocol in place for acceptance criteria. For all analyte calibrations lowest concentration must be at or near reporting limit (not adjusted for dilutions or dry weight corrections).

Initial calibration data for VOCs were reviewed and met the above criteria for linearity and sensitivity, without exception.

General observation: Lab used either weighted linear regression or quadratic calibrations for all analytes that did not pass response factor criteria noted above (greater than 15% RSD).

2.2 CONTINUING CALIBRATION

Continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours. The following criteria are employed to evaluate continuing calibration data:

i.) All RRF values for System Performance Check Compounds (SPCCs) must meet method and compound specific minimal sensitivity criteria of 0.1 or 0.3; and

ii.) Percent difference (%D) or percent drift values between expected and observed standard concentrations or initial and continuing RRF must not exceed 20 percent for the calibration check compounds (CCCs) and should not exceed 20 % for the remaining target compounds.

Calibration standards were analyzed at the required frequency and the results met the above criteria for instrument sensitivity and linearity of response with no exceptions.

All continuing calibrations met method specified sensitivity and precision/accuracy criteria noted in paragraph (i) above. There were a few non CCC analytes that exceeded the 20% recommendation for continuing calibration and initial calibration verifications, but none of these outliers resulted in the requirement for qualification of client sample final report results.

2.3 INTERNAL STANDARD (IS) RECOVERIES – GC/MS VOCs

To correct for changes in GC/MS response and sensitivity, several IS compounds are added to each investigative and QC sample prior to VOC analysis. All results are calculated relative to the IS response. The criteria by which the IS results are assessed are as follows:

i.) IS area counts for every investigative and QC sample must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard; and

ii.) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard.

The sample results were calculated properly and al IS recoveries met the above criteria, with no exceptions.

2.4 SURROGATE SPIKE RECOVERIES – VOCs

In accordance with the methods employed, all standards, blanks and samples for VOCs are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of individual sample matrices on analytical efficiency and are assessed against either method, laboratory established or project-specific control limits. If surrogate recoveries are outside of established control limits presumably due to matrix effects these interferences must be confirmed by sample re-analysis or other standard accepted techniques. Investigative sample surrogate results that have been diluted to below the laboratories limits of quantitation in order to overcome sample matrix interferences or quantitate elevated target analyte levels will not be utilized to qualify data.

All surrogate recoveries were within the laboratory control limits, with no exceptions.

2.5 LABORATORY CONTROL SAMPLE (LCS) ANALYSES

The LCS serves as a measure of overall analytical performance (sample preparation and analysis) and the analyte recoveries are used to determine if an analytical method/system is of acceptable quality and considered in control. LCSs are prepared with all analytes of interest and analyzed with each sample batch and a frequency of 1 in 20.

LCS and LCS duplicates were prepared and analyzed for VOCs. The LCS and LCS duplicate recoveries and RPDs were within the laboratory control limits for all analytes of interest, with the following exceptions:

GCMS VOC LCS for 4-Methyl-2-pentanone, trans-1,3-Dichloropropene and 1,1,2,2-Tetrachloroethane recovered low outside of the labs acceptance window in QC batch 8079081. The LCSD recovered in control. The LCS/LCSD RPD was in control. No qualification required.

GCMS VOC LCSD for Tetrachloroethene, 1,1,2-Trichloro-1,2,2,-trifluoroethane and Trichlorofluoromethane recovered high outside of the labs acceptance window in QC

batch 8079081. The LCS recovered in control. The LCS.LCSD RPD was in control. No qualification required.

2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

Matrix spike analysis serves as a measure of the affects of the specific investigative sample matrix on the capability of the analytical technique/method to generate acceptable sample results. Aliquots of original sample are spiked with a subset of the analytes of interest for each parameter and prepared and analyzed with each sample batch for the parameters. Recoveries of these spiked analytes are compared to laboratory established control limits to determine if sample matrix interferences are present. MS/MSD criteria apply only to the original investigative sample and the associated MS/MSD samples. The relative percent difference (RPD) between the MS and MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared for VOCs.

Client Specified MS/MSD Samples	***Parameters***
AMW-05B (20080311)	VOC's

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with the following exceptions (see Table 4 for a summary of data qualifications):

GCMS VOC MS/MSD for 2-Hexanone recovered low outside of the labs acceptance window in QC batch 8079081. The sample was project specific A8C130254-001. The sample result was reported non-detect and is flagged UJ and considered estimated.

GCMS VOC MS/MSD for 1,1,2-Trichloro-1,2,2-trifluoroethane recovered high outside of the labs acceptance window in QC batch 8079081. The sample was project specific A8C130254-001. The sample result was reported non-detect. No qualification required.

GCMS VOC MS for cis-1,3-Dichloropropene, 1,1-Dichloroethane, 1,1,2,2-Tetrachloroethane, Vinyl chloride, 1,2-Dichloropropane,1,1,2-Trichloroethane and 4-Methyl-2-pentanone recovered low outside of the labs acceptance window in QC batch 8079081. The MSD recovered in control. The MS/MSD RPD was in control. The sample was project specific A8C130254-001. No qualification required.

GCMS VOC MSD for Tetrachloroethene and Trichlorofluoromethane recovered slightly high outside of the labs acceptance windows in QC batch 8079081. The MS recovered in control. The MS/MSD RPD was in control. The sample was project specific A8C130254-001. No qualification required.

2.7 FIELD QA/QC – FIELD DUPLICATE ANALYSES

To assess the analytical and sampling protocol precision, field duplicates were collected and submitted "blind" to the laboratory as follows:

Sample Duplicate	*Original Sample*	*Parameters*
NA	NA	NA

A field duplicate was not identified for this submittal.

Project or regulatory specific field duplicate criteria was not provided to Enovis for this project, therefore Enovis default specific criteria would have been utilized.

Water field duplicate criteria is 20% RPD when the results are greater than 5x the RDL. If the results are less than 5x the RDL the RDL value itself is utilized. If both results are less than the RDL no qualification is required. If the RPD is above criteria then the original result will be flagged J or UJ for non-detect result.

2.8 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

There were no specified target analyte lists or detection limits provided to Enovis for evaluation.

2.9 COMPOUND IDENTIFICATION AND QUANTITATION

Lab generated standard mass spectra for all identified target analyte compounds are compared to the method criteria for qualitative analysis (compound identification). The chromatographic performance is also evaluated during this review. All reported detections must pass both mass spectral and retention time criteria and un-reported target analytes will also be reviewed to verify that false negatives are not present.

Detected target analyte results are selectively evaluated to ensure that correct internal standard, quantitation ion and appropriate calibration response factors are utilized to quantitate final results. The potential for transcription and calculational errors were also evaluated.

All laboratory target analyte hits, reported results and associated limits of detection for the client samples and QC were acceptable with no exceptions.

2.10 TENTATIVELY IDENTIFIED COMPOUNDS (TICS)

If tentatively identified compounds were required for this project, all associated mass spectra and best match spectra were evaluated against the same qualitative criteria as used for target analytes. Quantitation of TICs is already considered estimated per the nature of the quantitation technique defined so evaluation of the quantitated results beyond the identification level will not be performed.

TICs were not requested for this project.

3.0 SEMI-VOLATILE ORGANIC COMPOUNDS (SVOCs)

3.1 GC/MS CALIBRATION –SVOCs

3.1.1 TUNING AND MASS CAILBRATION

Prior to analysis GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, the SVOC method requires the analysis of the specific tuning compound Decafluorotriphenylphosphine (DFTPP). The resulting spectra must meet the criteria cited in the method before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument. This performance solution must also contain compounds that are used to verify injection port inertness and column performance which are evaluated to determine if the chromatographic system is suitable for analysis of investigative samples.

Instrument tuning data were reviewed. Tuning compounds were analyzed at the required frequency throughout the SVOC analysis periods. All tuning criteria were met for the analyses, indicating proper optimization of the instrumentation.

3.1.2 INITIAL CALIBRATION

A multi-point point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific calibration range. Calibration data including the documented integrity of standards used for all quantitated analysis were reviewed for all samples. Linearity of the calibration curve and instrument sensitivity were evaluated against the following criteria:

i.) All average relative response factors (RRFs) must be greater than or equal to 0.05; all method specific requirements for SPCC responses for selective compounds are met; and

ii.) All response factors are stable over the concentration range of the calibration with a percent relative standard deviation (%RSD) of less than 15% for linearity to be assumed, else correlation coefficients must be not less than 0.990; and method specific CCC criteria for selective compounds are met.

iii.) The appropriate method was used to determine linearity of the initial calibration if less than 15% RSD is not achievable.

Initial calibration data for SVOCs were reviewed and met the above criteria for linearity and sensitivity, with no exceptions.

Note: For non-linear initial calibrations (RSD greater than 15%) the lab utilized a quadratic equation with a minimum of 6 data points and up to 8 data points.

Two initial calibration sets were included with the raw data package reflecting the re-analysis sequence performed on a different instrument due to a method blank surrogate outlier situation.

3.2 CONTINUING CALIBRATION

Continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours. The following criteria are employed to evaluate continuing calibration data:

i.) All RRF values for System Performance Check Compounds (SPCCs) must meet method and compound specific minimal sensitivity criteria of 0.05; and

ii.) Percent difference (%D) values between expected and observed standard concentrations or initial and continuing RRF must not exceed 20 percent for the calibration check compounds (CCCs) and should not exceed 20 % for the remaining target compounds.

Calibration standards were analyzed at the required frequency and the results met the above criteria for instrument sensitivity and linearity of response.

All method required calibration check criteria were acceptable. The lab utilized a 50% difference/drift control limit for compounds not evaluated by method required criteria.

3.3 INTERNAL STANDARD (IS) RECOVERIES – GC/MS SVOCs

To correct for changes in GC/MS response and sensitivity, several IS compounds are added to each investigative and QC sample prior to SVOC analysis. All results are calculated relative to the IS response. The criteria by which the IS results are assessed are as follows:

i.) IS area counts for every investigative and QC sample must not vary by more than a factor of two (-50% to +100%) from the associated calibration standard; and

ii.) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard.

The sample results were calculated properly and al IS recoveries met the above criteria, with no exceptions.

3.4 SURROGATE SPIKE RECOVERIES – SVOCs

In accordance with the methods employed, all standards, blanks and samples for SVOCs are spiked with surrogate compounds prior to sample extraction and analysis. Surrogate recoveries provide a means to evaluate the effects of individual sample matrices on analytical efficiency and are assessed against either method, laboratory established or project-specific control limits. If surrogate recoveries are outside of established control limits presumably due to matrix effects these interferences must be confirmed by sample re-analysis or other standard accepted techniques. Investigative sample surrogate results that have been diluted to below the

laboratories limits of quantitation in order to overcome sample matrix interferences or quantitate elevated target analyte levels will not be utilized to qualify data.

All surrogate recoveries were within the laboratory control limits, with the following exceptions (see Table 5 for a summary of data qualifications):

GCMS SVOC Surrogates for the method blank in QC batch 8074037 did not recover. The lab re-extract and re-analyzed the associated samples in QC batch 8079104. The sample surrogates recovered in control in both the initial and re-extracts. The lab reported both sets of analyses. The re-extraction occurred 1 day outside of hold time. Enovis recommends that the results from the initial sample analysis be considered acceptable. The re-extract results are flagged R to indicate which results to report.

3.5 LABORATORY CONTROL SAMPLE (LCS) ANALYSES

The LCS serves as a measure of overall analytical performance (sample preparation and analysis) and the analyte recoveries are used to determine if an analytical method/system is of acceptable quality and considered in control. LCSs are prepared with all analytes of interest and analyzed with each sample batch and a frequency of 1 in 20.

LCSs were prepared and analyzed for SVOCs. The LCS recoveries were within the laboratory control limits for all analytes of interest, with the following exceptions:

GCMS SVOC LCS for 1,1-Biphenyl recovered slightly (3%) low outside of the labs acceptance window in QC batch 8074037. The project specific MS/MSD for A8C130254-001 recovered in control. No qualification required.

GCMS SVOC LCS for Caprolactam recovered low outside of the labs acceptance window in QC batch 8079104. The associated sample results were reported non-detect. The sample results associated with this QC batch are not being reported. If the results from the re-extract were reported then the result would be flagged UJ and considered estimated.

3.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

Matrix spike analysis serves as a measure of the affects of the specific investigative sample matrix on the capability of the analytical technique/method to generate acceptable sample results. Aliquots of original sample are spiked with a subset of the analytes of interest for each parameter and prepared and analyzed with each sample batch for the parameters. Recoveries of these spiked analytes are compared to laboratory established control limits to determine if sample matrix interferences are present. MS/MSD criteria apply only to the original investigative sample and the associated MS/MSD samples. The relative percent difference (RPD) between the MS and MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared for SVOCs.

Client Specified MS/MSD Samples	*Parameters*
AMW-05B (20080311)	SVOC's

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with the following exceptions (see Table 4 for a summary of data qualifications):

GCMS SVOC MS/MSD for Caprolactam recovered low outside of the labs acceptance window in QC batch 8079104. The associated sample results were reported non-detect. The sample results associated with this QC batch are not being reported. If the results from the re-extract were reported then the result would be flagged UJ and considered estimated.

GCMS SVOC MS/MSD RPD for bis(2-Chloroethyl)ether was above the labs acceptance limit in QC batch 8074037. Both the MS and MSD recovered in control. No qualification required.

GCMS SVOC MS/MSD RPD for 4-Chloroanaline was above the labs acceptance limit in QC batch 8079104. Both the MS and MSD recovered in control. No qualification required.

Remaining batch MS/MSD recovery outliers were not target analytes for this analysis for these samples so did not translate into qualification of client sample results and are not addressed in this validation report.

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

3.7 FIELD QA/QC – FIELD DUPLICATE ANALYSES

To assess the analytical and sampling protocol precision, field duplicates were collected and submitted "blind" to the laboratory as follows:

Sample Duplicate	*Original Sample*	*Parameters*
NA	NA	NA

A field duplicate was not identified for this submittal.
Project or regulatory specific field duplicate criteria was not provided to Enovis for this project, therefore Enovis default specific criteria would have been utilized.

Water field duplicate criteria is 20% RPD when the results are greater than 5x the RDL. If the results are less than 5x the RDL the RDL value itself is utilized. If both results are less than the RDL no qualification is required. If the RPD is above criteria then the original result will be flagged J or UJ for non-detect result.

3.8 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

There were no specified target analyte lists or detection limits provided to Enovis for evaluation.

3.9 COMPOUND IDENTIFICATION AND QUANTITATION

Lab generated standard mass spectra for all identified target analyte compounds are compared to the method criteria for qualitative analysis (compound identification). The chromatographic performance is also evaluated during this review. All reported detections must pass both mass spectral and retention time criteria and un-reported target analytes will also be reviewed to verify that false negatives are not present.

Detected target analyte results are selectively evaluated to ensure that correct internal standard, quantitation ion and appropriate calibration response factors are utilized to quantitate final results. The potential for transcription and calculational errors were also evaluated.

It could not be determined from the Level 4 data package provided if cleanup of sample extracts was performed or was an available option for samples showing the presence of matrix interferences.

All laboratory target analyte hits, reported results and associated limits of detection for the client samples and QC were acceptable with no exceptions.

General observations:

Chromatography was acceptable with good resolution between peaks and adequate sensitivity.

3.10 TENTATIVELY IDENTIFIED COMPOUNDS (TICS)

If tentatively identified compounds were required for this project, all associated mass spectra and best match spectra were evaluated against the same qualitative criteria as used for target analytes. Quantitation of TICs is already considered estimated per the nature of the quantitation technique defined so evaluation of the quantitated results beyond the identification level will not be performed.

TICs were not requested for this project.

4.0 POLYCHLORINATED BIPHENYLS (PCBs)

4.1 INITIAL CALIBRATION – GAS CHROMATOGRAPHY/ ELECTRON CAPTURE DETECTOR (GC/ECD) CALIBRATION

A multi-point calibration curve containing all compounds or congeners of interest is analyzed to characterize instrument response for each analyte over a specific calibration range. Calibration data were reviewed for all samples. Linearity of the calibration curve, retention time window generation and instrument sensitivity were evaluated against the following criteria:

i.) RT windows established based on a minimum of a 3 pt. calibration.

ii.) %RSD values must not exceed 20 percent, else linearity cannot be assumed and the method used for calibration must be identified and supported.

iii.) If a two-column system is utilized for PCB analysis both detectors (if both were used for sample quantitation) must be evaluated.

Initial calibration data for PCBs were reviewed and met the above criteria for linearity and sensitivity, with no exceptions.

A two column system was used for confirmation of PCB detections. Raw data from both systems was included with the validation package and both columns initial calibration results were acceptable.

4.2 CONTINUING CALIBRATION

Continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours. The following criteria are employed to evaluate continuing calibration data:

i.) All analytes must fall within established retention time windows.

ii.) %D values must not exceed 15 percent for the calibration compounds on either column used for quantitation of that analyte.

Calibration standards were analyzed at the required frequency for both columns and the results met the above criteria for instrument sensitivity and linearity of response with no exceptions.

4.3 SURROGATE SPIKE RECOVERIES – PCBs

In accordance with the methods employed, all standards, blanks and samples for PCBs are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means of evaluate the effects of individual sample matrices on analytical efficiency and are assessed against method control limits. For PCB analysis at least one of the two surrogate recoveries must be within laboratory established control limits.

All surrogate recoveries were within the laboratory control limits, with no exceptions.

4.4 LCS ANALYSES

The LCS serves as a measure of overall analytical performance. LCSs may be prepared with a subset of the analytes of interest (PCB Aroclors) as long as all contaminant types are represented. One LCS will be analyzed with each sample batch and possibly a second LCS-Duplicate will also be analyzed if analytical precision information cannot be obtained by sample duplicate or MS/MSD analysis.

LCSs were prepared and analyzed for PCBs. The LCS recoveries were within the laboratory control limits for all analytes of interest, with no exceptions.

4.5 MS/MSD ANALYSES

MS/MSD samples are spiked with a subset of the analytes of interest for each parameter and prepared and analyzed with each sample batch for the parameters. The relative percent difference (RPD) between the MS and MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared for PCBs.

Client Specified MS/MSD Samples	***Parameters***
AMW-05B (20080311)	PCB's

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with no exceptions (see Table 4 for a summary of data qualifications).

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

4.6 FIELD QA/QC – FIELD DUPLICATE ANALYSES

To assess the analytical and sampling protocol precision, field duplicates were collected and submitted "blind" to the laboratory as follows:

Sample Duplicate	***Original Sample***	***Parameters***
NA	NA	NA

A field duplicate was not identified for this submittal.

Project or regulatory specific field duplicate criteria was not provided to Enovis for this project, therefore Enovis default specific criteria would have been utilized.

Water field duplicate criteria is 20% RPD when the results are greater than 5x the RDL. If the results are less than 5x the RDL the RDL value itself is utilized. If both results are less than the

RDL no qualification is required. If the RPD is above criteria then the original result will be flagged J or UJ for non-detect result.

4.7 EXTRACT CLEANUP – EFFICIENCY VERIFICATION

The method references several allowable cleanup techniques to reduce the level of matrix interferences for PCB's in the final sample prep extract. Any cleanup technique utilized for this sample delivery group must demonstrate that acceptable PCB recovery can be obtained by using this method.

The following cleanup techniques were utilized by the lab and with acceptable demonstrated efficiencies:

> According to the extraction bench sheets an acid strip (sulfuric acid wash) is utilized for all samples and QC. The batch QC reported verifies that this cleanup technique has met required efficiencies and recoveries.

4.8 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

There were no specified target analyte lists or detection limits provided to Enovis for evaluation.

4.9 COMPOUND IDENTIFICATION AND QUANTITATION

Second column confirmation is required for all GC identifications, unless historical data is available to verify the PCB Aroclor identity. PCB identification is verified by comparing second column results; basic pattern recognition and retention time data comparisons as well as evaluating for interferences. The chromatographic performance is also evaluated during this review. All reported detections must be accompanied by a daily calibration check standard of the same Aroclor type which was used for quantitation purposes.

Detected target analyte results are selectively evaluated to ensure that correct calibration response factors and calculations are utilized to quantitate final results. The potential for transcription and calculational errors were also evaluated.

All laboratory target analyte hits, reported results and associated limits of detection for the client samples and QC were acceptable with the following exceptions:

Please see section on initial calibration for comments on the peak ratio algorithm utilized by the lab to aid in Aroclor identification.

5.0 GASOLINE RANGE ORGANICS (TPH-GRO)

5.1 INITIAL CALIBRATION – GAS CHROMATOGRAPHY CALIBRATION

A five point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific calibration range. Calibration data were reviewed for all samples. Linearity of the calibration curve and instrument sensitivity were evaluated against the following criteria:

i.) Linear calibration curve using 5 calibration levels or more with correlation coefficients not less than 0.990.

Initial calibration data for GRO were reviewed and met the above criteria for linearity and sensitivity.

5.2 CONTINUING CALIBRATION

Continuing calibration standards must be analyzed and compared to the initial calibration curve at the beginning of each working day. The following criteria are employed to evaluate continuing calibration data:

i.) %D values must not exceed 20 percent from the known concentration

Calibration standards were analyzed at the required frequency and the results met the above criteria for instrument sensitivity and linearity.

5.3 SURROGATE SPIKE RECOVERIES

In accordance with the methods employed, all standards, blanks and samples for GROs are spiked with a surrogate compound prior to sample extraction and/or analysis. Surrogate recoveries provide a means of evaluate the effects of individual sample matrices on analytical efficiency and are assessed against method control limits.

Use of surrogate spikes and recoveries is not explicitly required by the Wisconsin GRO method unless the test is performed as part of a PVOC analysis. Surrogate recoveries were not reported for client sample results or any QC analysis for this data submittal. The below MDL response for the client sample was similar to that of the batch method blank so analytical performance appeared to be in control for the sample analysis.

5.4 LCS ANALYSES

The LCS serves as a measure of overall analytical performance. LCSs are prepared with all analytes of interest and analyzed with each sample batch.

LCS/LCSD samples were prepared and analyzed for GROs.

The LCS/LCSD recoveries and RPD were within the laboratory control limits for all analytes of interest.

5.5 MS/MSD ANALYSES

MS/MSD samples are spiked with a subset of the analytes of interest for each parameter and prepared and analyzed with each sample batch for the parameters. The relative percent difference (RPD) between the MS and MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared for GRO.

Client Specified MS/MSD Samples	***Parameters***
AMW-05B (20080311)	GRO

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with no exceptions (see Table 4 for a summary of data qualifications).

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

5.6 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

No specific limits of detection were provided for this project.

5.7 COMPOUND IDENTIFICATION AND QUANTITATION

Chromatographic performance is also evaluated during this review. All reported detections must be accompanied by a daily calibration check standard of the type which was used for quantitation purposes.

Detected target analyte results are selectively evaluated to ensure that correct calibration response factors and calculations are utilized to quantitate final results. The potential for transcription and calculational errors were also evaluated.

All laboratory target analyte hits, reported results and associated limits of detection for the client samples and QC were acceptable.

6.0 DIESEL RANGE ORGANICS (DRO)

6.1 INITIAL CALIBRATION – GAS CHROMATOGRAPHY CALIBRATION

A five point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific calibration range. Calibration data were reviewed for all samples. Linearity of the calibration curve and instrument sensitivity were evaluated against the following criteria:

i.) Linear calibration curve with correlation coefficients not less than 0.990.

Initial calibration data for DRO were reviewed and met the above criteria for linearity and sensitivity.

6.2 CONTINUING CALIBRATION

Continuing calibration standards must be analyzed and compared to the initial calibration curve at the beginning of each working day. The following criteria are employed to evaluate continuing calibration data:

i.) %D values must not exceed 20 percent from the known concentration

Calibration standards were analyzed at the required frequency and the results met the above criteria for instrument sensitivity and linearity of response with no exceptions.

6.3 SURROGATE SPIKE RECOVERIES – (DRO)

In accordance with the methods employed, all standards, blanks and samples for DROs are spiked with a surrogate compound prior to sample extraction and/or analysis. Surrogate recoveries provide a means of evaluate the effects of individual sample matrices on analytical efficiency and are assessed against method control limits.

Surrogates are not mandatory in the Wisconsin DRO method. However, if the laboratory intends to use surrogates, they must be chosen so that they do not elute within the DRO retention time window. Surrogates known to meet this criterion are Nonane (C_9) and Nonacosane (C_{29}).
The laboratory reported Nonane (C_9) as the surrogate.

All surrogate recoveries were within the laboratory control limits, with the following exceptions:

DRO Surrogate recovered high outside of the labs acceptance window in samples A8C130254-001 and the associated method blank. The surrogate recovery for this method is only advisory. Qualification is not based on surrogate recovery. Surrogate recovery was also biased high in the method blank.

6.4 LCS ANALYSES

The LCS serves as a measure of overall analytical performance. LCSs are prepared with all analytes of interest and analyzed with each sample batch.

LCSs were prepared and analyzed for DROs. The LCS recoveries were within the laboratory control limits for all analytes of interest.

6.5 MS/MSD ANALYSES

MS/MSD samples are spiked with a subset of the analytes of interest for each parameter and prepared and analyzed with each sample batch for the parameters. The relative percent difference (RPD) between the MS and MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared for DRO.

Client Specified MS/MSD Samples	***Parameters***
AMW-05B (20080311)	DRO

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with no exceptions (see Table 4 for a summary of data qualifications).

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

6.6 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

All analyte lists and limits of detection met the specified criteria.

6.7 COMPOUND IDENTIFICATION AND QUANTITATION

Chromatographic performance is also evaluated during this review. All reported detections must be accompanied by a daily calibration check standard of the type which was used for quantitation purposes.

Detected target analyte results are selectively evaluated to ensure that correct calibration response factors and calculations are utilized to quantitate final results. The potential for transcription and calculational errors were also evaluated.

All laboratory target analyte hits, reported results and associated limits of detection for the client samples and QC were acceptable.

7.0 METALS

7.1 INDUCTIVELY COUPLED PLASMA (ICP)– METALS AND MERCURY INITIAL CALIBRATION

To calibrate the ICP, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve. Resulting correlation coefficients for mercury curves must be at least 0.995.

After calibration, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	***Inorganic Species***	***Control Limits (Percent)***
ICP	Metals	90-110
Cold Vapor Atomic Absorption (AA)	Mercury	80-120

A review of the data showed that all metals calibration curves and ICVs were analyzed at the proper frequencies and that all of the above criteria were met. The laboratory effectively demonstrated that instrumentation used for these analyses were properly calibrated prior to sample analyses.

7.2 CONTINUING CALIBRATION

Continuing Calibration Verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside of the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits with out exception.

7.3 CONTRACT REQUIRED DETECTION LIMIT (CRDL) STANDARD ANALYSES

To verify the linearity of the ICP calibration near the CRDL, a standard must be analyzed which contains specific analytes at a concentration of two times the CRDL, or twice the Instrument

Detection Limit (IDL), whichever is greater. This standard must be analyzed at the beginning and end of each sample analysis run or a minimum of twice per 8-hour working shift.

To verify linearity near the CRDL during mercury analysis, a standard must be analyzed at the CRDL or the IDL, whichever is greater. The standard must be analyzed at the beginning of each sample analysis run.

CRDL standards were analyzed at the proper frequencies. Control limits of 50 to 150 percent were used to evaluate the ICP data. The laboratory also utilized the 50-150 percent recovery control limits for mercury. Analytes were within the control limits.

7.4 LCS ANALYSIS

The LCS serves as a measure of overall analytical performance. LCSs are prepared with all analytes of interest and analyzed with each sample batch.

LCSs were prepared and analyzed for all parameters. The LCS recoveries were within the laboratory control limits for all analytes of interest.

7.5 MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

For metals analyses, MS/MSD samples are prepared and analyzed. The recoveries of spike analyses are used to assess the analytical accuracy achieved on individual sample matrices. If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed. The RPD between the MS and the MSD are used to assess analytical precision.

Client specific MS/MSD samples were prepared total metals and mercury.

Client Specified MS/MSD Samples	***Parameters***
AMW-05B (20080311)	ICP metals and Mercury

The spike recoveries showed acceptable accuracy and the lab duplicate results showed acceptable overall precision with no exceptions (see Table 4 for a summary of data qualifications).

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

7.6 ICP SERIAL DILUTION

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of one investigative sample is analyzed at a five-fold dilution. For samples yielding analyte concentrations greater than 50 times the IDL, the serial dilution results must agree within 10 percent of the original results

Serial dilutions were not performed on a client sample from this submittal. PDS analysis was not performed for this QC batch (not a method requirement).

7.7 FIELD QA/QC – FIELD DUPLICATE ANALYSES

To assess the analytical and sampling protocol precision, field duplicates were collected and submitted "blind" to the laboratory as follows:

Sample Duplicate	***Original Sample***	***Parameters***
NA	NA	NA

A field duplicate was not identified for this submittal.

Project or regulatory specific field duplicate criteria was not provided to Enovis for this project, therefore Enovis default specific criteria would have been utilized.

Water field duplicate criteria is 20% RPD when the results are greater than 5x the RDL. If the results are less than 5x the RDL the RDL value itself is utilized. If both results are less than the RDL no qualification is required. If the RPD is above criteria then the original result will be flagged J or UJ for non-detect result.

7.8 TARGET ANALYTES AND REQUIRED LIMITS OF DETECTION

The analyte lists reported by the laboratory must comply with the requested target analyte list according to the client statement of work or regulatory requirement if known. The laboratory analyte reporting limits must also meet (equal to or less than) than those specified in the client statement of work or applicable regulatory requirement if known. Reporting limits not meeting the specified criteria due to dilutions required to overcome sample matrix interferences or because of dry weight corrections will not be noted here.

There were no specified target analyte lists or detection limits provided to Enovis for evaluation.

8.0 REPRESENTATIVENESS EVALUATION

Representativeness is a qualitative evaluation of whether the data represents actual environmental conditions. Representativeness was evaluated using holding time criteria, which reflect the length of time after sample collection that a sample or extract remains representative of environmental conditions. Depending on the analysis, either one or two holding times were evaluated. For those analyses that do not include a sample extraction, only one holding time was evaluated: the length of time between sample collection and analysis. For analyses that require sample extraction prior to analysis, two holding times were evaluated: the length of time from sampling until extraction and the length of time from extraction to analysis. Holding times were compared to standard method specific holding times accepted by the United States Environmental Protection Agency (USEPA). All holding times that are within acceptance criteria are considered representative. Those holding times outside of USEPA acceptance criteria are qualitatively evaluated to determine their effect on sample representativeness.

Representativeness was also evaluated by analysis of laboratory method blanks and equipment blanks which were used to identify sources of contamination not associated with environmental conditions.

8.1 SAMPLE HOLDING TIMES

Sample holding time and preservation requirements are summarized in Table 7. All sample extractions and/or analyses were performed within the specified holding times with the following exceptions:

All samples were properly preserved and cooled to 0-6^{o}C after collection.

8.2 METHOD BLANK ANALYSES

Method Blank (MB) samples are prepared from de-ionized water and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the procedures.

The criterion for qualifying analytical results due to blank contamination is as follows:

For Organic methods the sample concentration was < the RDL and < 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reporting detection limit. For results reported above the RDL but within the listed criteria the results are considered non-detect at the listed sample concentration.

For Inorganic methods the sample concentration was < the RDL and 10x the blank concentration and is considered non-detect at the reporting detection limit. For results reported above the RDL but within the listed criteria the results are considered non-detect at the listed sample concentration.

For this study, method blanks were analyzed at a minimum frequency of one per analytical batch.
The method blank results for samples from the lab reports covered in this evaluation were all non-detect at the method detection limit with the following exceptions (see Table 6 for a summary of data qualifications):

GCMS VOC Method Blank for Acetone and 1,2,3-Trichlorobenzene were reported between the MDL and RDL in QC batch 8079081. The Acetone concentration reported in the Trip Blank was higher than the method blank. The associated field sample result for A8C130254-001 was reported non-detect. No qualification required. The 1,2,3-Trichlorobenzene concentration in the Trip Blank was slightly less than the method blank concentration. The associated field sample result for A8C130254-001 was reported non-detect. No qualification required.

GCMS VOC Trip Blank reported Acetone, Methyl ethyl ketone, Methylcyclohexane, 1,2,3-Trichlorobenzene and Naphthalene results between the MDL and RDL. The

associated results for A8C130254-001 were reported non-detect. No qualification required.

GCMS SVOC Method Blank for bis(2-Ethylhexyl)phthalate was reported between the MDL and RDL in QC batch 8074037. The associated result for A8C130254-001 was reported between the MDL and RDL and less than 10x the method blank concentration and is flagged UB and considered non-detect at the RDL.

DRO method blank for QC batch 8074048 showed a detection between the MDL and RL. Client sample result A8C130254-001 also had a detection between the MDL and RL for DRO. This sample result should be considered non-detect at the reporting limit and qualified with a UB flag.

Metals Method Blank for Barium was reported between the MDL and RDL in QC batch 8074016. The associated sample result for A8C130254-001 was reported between the MDL and RDL and greater than 10x the method blank concentration and is flagged J as an estimated value. No further qualification required.

Evaluation of blank contamination includes directions on the interpretation of the affected analytical results; however it is beyond the scope of Enovis validation to apply changes to the result and quantitation limit in the Ford Master Analytical database. The end data user must implement any corrections to the electronic data downloaded from the Enovis CLMS based on project requirements.

9.0 USABILITY AND COMPARABIILTY

Usability of data was evaluated by assuring that all the analytical requests were met, samples were received in the proper condition, and all analyses were performed within the appropriate holding times.

No data evaluated within this delivery group was considered unusable (qualified with an R flag) due to sample integrity, sample matrix interference or batch quality control issues. Semivolatile organic results for the re-extract of sample AMW-05B (20080311) were flagged R to indicate the valuators' choice of results to report.

10.0 QC SUMMARY

All sample results meet the standard for usability and are considered acceptable as qualified. Please reference the following tables for a summary of the investigative field sample data and their valid qualifiers based on Level 4 technical review of the analytical data.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant - 03
Project number: MN000593.0002.MN
Laboratory: TestAmerica - North Canton
Laboratory submittal: A0B030456
Sample date: 2009-10-06
Report received by Enovis: 2010-02-10
Initial Data Verification completed by Enovis: 2010-02-11

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

3 Water sample(s), 1 duplicate and 1 equipment blank water were analyzed for PCB parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

The following minor QC exceptions or missing information were noted:

PCB sample prep hold times were reported as exceeded on the laboratory analytical report. Based on recent EPA method update rule changes addressing PCB hold times Enovis is utilizing 1 year as the recommended hold time between sample collection and prep for water matrices. Therefore qualification is not required for the PCB results based on the analytical hold times noted in the laboratory report.

PCB equipment blank was non-detect for all target PCB aroclors.

PCB MSD recoveries and MS/MSD RPD's performed on client sample -001 were outside of laboratory control limits with the recoveries biased high for aroclors 1016 and 1260. Client sample -001 results for PCB's were non-detect so qualification is not required based on these high bias MSD's.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

CASE NARRATIVE

A0B030456

The following report contains the analytical results for five water samples submitted to TestAmerica North Canton by ARCADIS U.S., Inc. from the Ford TCAP 03 E200572 Site, project number MN000593.0002 MN. The samples were received October 08, 2009, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.9 and 2.7°C.

The sample(s) AMW-05B(20091006), AMW-07(20091006), AMW-03B(20091006), DUP-001(20091006) and EB-001(20091006) could not be analyzed within holding time for method, 8082 PCB's, because the request for the test was made after the holding time for the samples expired. The samples were collected on 10-6-09, received in the Laboratory on10-8-09 and 8082 PCB's was requested on 2-3-10.

POLYCHLORINATED BIPHENYLS-8082

The matrix spike/matrix spike duplicate(s) for AMW-05B(20091006) had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.

California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190),NAVY, ARMY, USDA Soil Permit

SAMPLE SUMMARY

SAMPLE SUMMARY

A0B030456

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
LT5N7	001	AMW-05B(20091006)	10/06/09	08:20
LT5PF	002	AMW-07(20091006)	10/06/09	10:00
LT5PQ	003	AMW-03B(20091006)	10/06/09	11:40
LT5PV	004	DUP-001(20091006)	10/06/09	
LT5P1	005	EB-001(20091006)	10/06/09	09:30

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

THE LEADER IN ENVIRONMENTAL TESTING

END OF REPORT

August 29, 2007

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, US

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000593.5
Laboratory: TestAmerica, formerly STL - North Canton
Laboratory submittal: A7G180138
Sample date: 2007-07-17
Report received by Enovis: 2007-08-02
Revised Data Verification completed by Enovis: 2007-08-29

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

Verification report revised to include evaluation of field duplicate analysis. Valid qualifier flags added to database for estimated values and qualified analytical results. Blank contamination recommendation language revised.

Field duplicate sample ID DUP-001(20070717)FD was identified as AMW-03A(20070717). All FD results reported above the MDL were less than 2x the sample results for AMW-03 and showed good correlation with compounds consistently reported.

The following minor QC exceptions or missing information were noted:

VOC trip blank reported a concentration of Methyl ethyl ketone between the MDL and the RDL. Results for samples A7G180138-001, 002, 003, 005 and 006 also reported concentrations between the MDL and the RDL are flagged UB and should be considered non-detect at the RDL.

VOC method blank for 1,2,3-Trichlorobenzene concentration reported between the MDL and the RDL. Results for samples A7G180138-001 and 002 were reported between the MDL and the RDL are flagged UB and should be considered non-detect at the RDL

VOC method blank results were reported for Naphthalene, 2-Methylnaphthalene and Chloroform above the MDL. The associated samples were reported not detected so data qualification of client sample results for these analytes is not required based on the method blank results.

SVOC method blank for bis-2-Ethylhexyl phthalate reported a concentration above the MDL. Sample results for A7G180138-001, 002, 003, 004, 005 and 006 had concentrations that were reported between the MDL and the RDL are flagged UB and should be considered non-detect at the RDL.

SVOC method blank for Caprolactam reported a concentration above the MDL. Samples results for A7G180138-001, 003, 004 and 005 had concentrations that were reported between the MDL and the RDL are flagged UB and should be considered non-detect at the RDL.

SVOC method blank for Di-n-butyl phthalate reported a concentration above the MDL. Sample results for A7G180138-001, 002, 003, 004, 005 and 006 had concentrations that were reported between the MDL and the RDL are flagged UB and should be considered non-detect at the RDL.

PCB LCS/LCSD RPD for Aroclor 1260 was outside of lab control limits. Data qualification of investigative samples is not required based on this QC outlier.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://63.106.80.11/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A7G180138

The following report contains the analytical results for six water samples and one quality control sample submitted to TestAmerica (formerly STL North Canton) by ARCADIS Geraghty & Miller, Inc from the Ford Bundle Sites E200572 Site, project number MN000593.5. The samples were received July 18, 2007, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 80.

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.8, 0.9, 1.3 and 1.6°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7201103. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

GC/MS SEMIVOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7200133. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

POLYCHLORINATED BIPHENYLS-8082

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7200123. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

CASE NARRATIVE (continued)

POLYCHLORINATED BIPHENYLS-8082 (continued)

Batch(es) 7200123 had RPDs outside QC criteria in the LCS/LCSD, but recoveries were within QC criteria; therefore, no corrective action was required.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton (formerly STL North Canton) conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton (formerly STL North Canton) requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

END OF REPORT

August 30, 2007

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, US

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000593.5
Laboratory: TestAmerica, formerly STL - North Canton
Laboratory submittal: A7G250252
Sample date: 2007-07-24
Report received by Enovis: 2007-08-08
Revised Data Verification completed by Enovis: 2007-08-30

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

Verification report revised to change blank contamination recommendation language. Valid qualifier flags changed in the database.

The following minor QC exceptions or missing information were noted:

The lab report case narrative noted that VOC analysis of water samples for 2-Chloroethylvinylether on an acid preserved vial, such as the vials analyzed for this deliverable, are subject to chemical reactions that result in a low bias. The 2-Chloroethylvinylether results for samples A7G250252-01 and 02 were non-detect so the associated reporting limits should be considered estimated and qualified with UJ flags.

VOC LCS recovery outliers for Acrolein and 1,1,2,2-Trichloroethane did not translate into the requirement for qualification of client investigative sample VOC results.

VOC MS/MSD analysis was not performed on a sample from this client delivery group. Data qualification of client sample results based on these QC outliers is not required.

GCMS VOC method blank concentration for Methylene chloride reported between the MDL and the RDL. The associated sample was reported non-detect. No qualification required.

GCMS VOC method blank concentration for 1,2,3-Trichlorobenzene reported between the MDL and the RDL. The associated sample was reported non-detect. No qualification required.

GCMS SVOC method blank for bis-2-Ethylhexylphthalte was reported above the MDL. Results for sample A7G250252-01 are flagged UB and should be considered non-detect at the RDL.

SVOC LCS/LCSD recoveries for Atrazine, Acetophenone, Benzaldehyde, 1,1-Biphenyl, Caprolactam and 1,4-Dioxane were outside of lab control limits biased high. Data qualification of client sample results for these analytes based on these QC outliers is not required.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://63.106.80.11/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A7G250252

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica (formerly STL North Canton) by Arcadis, Geraghty & Miller, Inc from the Ford Twin Cities B, E200572 Site, project number MN000593.5. The samples were received July 25, 2007, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 60.

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 5.2°C.

See TestAmerica’s Cooler Receipt Form for additional information.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 7211291 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7212551. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

GC/MS SEMIVOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7207089. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

The associated LCS/LCSD was double spiked for Acetophenone, Atrazine, Benzaldehyde, 1,1’-Biphenyl and Caprolactam.

CASE NARRATIVE (continued)

POLYCHLORINATED BIPHENYLS-8082

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7207108. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton (formerly STL North Canton) conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton (formerly STL North Canton) requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY - Detection Highlights

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

END OF REPORT

December 31, 2007

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A7L180274
Sample date: 2007-12-17
Report received by Enovis: 2007-12-31
Initial Data Verification completed by Enovis: 2007-12-31

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

The following minor QC exceptions or missing information were noted:

GCMS VOC MS recovereies for Dichlorodiflyuoromethane, cis-1,2-Dichloropropene, Methylene chloride, 2-Hexanone and trans-1,2-Dichloroethene recovered slightly low outside of the labs acceptance limit in QC batch 7361128. The sample was project specific A7L180274-001. The MSD recovered in control. No qualification required.

GCMS VOC MS/MSD for Vinyl chloride recovered low outside of the labs acceptance window in QC batch 7361128. The sample was project specific A7L180274-001. The sample concentration was reported non-detect and should be considered estimated and flagged UJ.

GCMS VOC Method Blank concntrations for Naphthalene, 1,2,3-Trichlorobenzene and 1,2,4-Trichlorobenzene were reported between the MDL and the RDL in QC batch 7361128. The associated results for the Trip Blank reported similiar concentrations and should be considered non-detect at the RDL and are flagged UB. The field samples and equipment blank results were reported non-detect so no qualification is required.

GCMS SVOC LCS and MS/MSD for Caprolactam recovered low outside of the labs acceptance window in QC batch 7353054. The associated results were all reported non-detect and should be considered estimated and flagged UJ. The matrix spike was project specific A7L180274-001. The result was reported non-detect and is flagged UJ.

GCMS SVOC MS recovery for 1,4-Dichlorobenzene was above the labs acceptance window in QC batch 7353054. The sample was project specific A7L180274-001. The MSD recovered in control. No qualification required.

GCMS SVOC MS/MSD RPD for 4-Chloroaniline was above the labs acceptance limit in QC batch 7353054. The sample was project specific A7L180274-001. Both the MS and the MSD recovered in control. No qualification required.

Metals Method Blank for Barium reported a concentration between the MDL and the RDL in QC batch 7353019. The Total Barium result for Equipment blank EB-001 (A7L180274-003) reported a similiar concentration and should be considered non-detect at the RDL and is flagged UB.

Metals Method Blank for Lead reported a concentration between the MDL and the RDL in QC batch 7353019. The total Lead result for sample A7L180274-001 was reported above the RDL and less than 10x the method blank concentration and should be considered non-detect at the reported concentration and is flagged B.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://63.106.80.11/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A7L180274

The following report contains the analytical results for three water samples and one quality control sample submitted to TestAmerica North Canton by ARCADIS Geraghty & Miller, Inc. from the Ford Twin Cities E200572 Site, project number MN000593.5. The samples were received December 18, 2007, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 70.

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.2, 2.6, and 5.2°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for AMW-05B(12172007) had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

GC/MS SEMIVOLATILES

The matrix spike/matrix spike duplicate(s) for AMW-05B(12172007) had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

POLYCHLORINATED BIPHENYLS-8082

The analytical results met the requirements of the laboratory's QA/QC program.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton (formerly STL North Canton) conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton (formerly STL North Canton) requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY - Detection Highlights

ANALYTICAL METHODS SUMMARY

A7L180274

PARAMETER	ANALYTICAL METHOD
Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A
PCBs by SW-846 8082	SW846 8082
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Trace Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Volatile Organics by GC/MS	SW846 8260B

SAMPLE SUMMARY

A7L180274

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
KED5A	001	AMW-05B(12172007)	12/17/07	10:25
KED5W	002	AMW-3B(20071217)	12/17/07	13:50
KED5X	003	EB-001(20071217)	12/17/07	15:00
KED51	004	TRIP BLANK TB-001(20071217)	12/17/07	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A7L210396
Sample date: 2007-12-20 2007-12-18 2007-12-19
Report received by Enovis: 2008-01-08
Initial Data Verification completed by Enovis: 2008-01-09

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

The following minor QC exceptions or missing information were noted:

GCMS VOC LCS/LCSD for 4-Methyl-2-pentanone and cis-1,3-Dichloropropene recovered low outside of the labs acceptance window in QC batch 7365086. The associated results for sample A7L210396-009 were reported non-detect and are flagged UJ and should be considered estimated.

GCMS VOC LCS for Methylene chloride recovered slightly high outside of the labs acceptance window in QC batch 7365086. The LCSD recovered in control. No qualification required.

GCMS VOC LCS for Naphthalene and Dichlorodifluoromethane recovered low outside of the labs acceptance window in QC batch 7365086. The LCS recovered in control. No qualification required.

GCMS VOC LCS/LCSD for Methylene chloride recovered high outside of the labs acceptance window in QC batch 7361138. The associated sample results were all reported non-detect. No qualification required.

GCMS VOC LC/LCSD for 4-Methyl-2-pentanone and Naphthalene recovered low outside of the labs acceptance window in QC batch 7361138. The associated results A7L210396-001, 2,3,4,5,6 and 7 were reported non-detect and are flagged UJ and should be considered estimated.

GCMS VOC LCS for 1,2,4-Trichlorobenzene recovered slightly low outside of the labs acceptance window in QC batch 7361138. The LCSD recovered in control. No qualification required.

GCMS VOC Method blank for Hexachlorobutadiene in QC batch 7365086. The associated sample results was reported non-detect. No qualification required.

GCMS VOC Trip blanks TB-003, 4 and 5 reported concentrations of Acetone between the MDL and the RDL. All associated field sample results were reported non-detect. No qualification required.

Total and Dissolved Metals Method blank for Barium was reported between the MDL and the RDL in QC batch 7358139. The associated sample results were all reported between the MDL and the RDL and greater than 10x the method blank concentration except for A7L210396-001 Total Barium which was reported above the RDL. Qualification for the method blank is not required. Results reported between the MDL and thr RDL are flagged J.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://63.106.80.11/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A7L210396

The following report contains the analytical results for six water samples and three quality control samples submitted to TestAmerica North Canton by ARCADIS Geraghty & Miller, Inc. from the Ford Twin Cities E200572 Site. The samples were received December 21, 2007, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

Any reference within this document to Severn Trent Laboratories, Inc. or STL, should be understood to refer to TestAmerica Laboratories, Inc. (formerly known as Severn Trent Laboratories, Inc.)

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 107.

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 1.9, 2.0, 2.3, and 2.7°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 7361138 and 7365086 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate data for batch(es) 7360023 are not included in this report. The batch QC samples, which document the effect of a specific sample matrix on method performance, were not associated with a sample reported in this lot. The data, therefore, has no bearing on the samples reported herein. In order to document compliance with the QC requirement for an MS/MSD per 20 environmental samples, a summary of sample/QC associations has been provided following this case narrative.

POLYCHLORINATED BIPHENYLS-8082

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 7356025. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

CASE NARRATIVE (continued)

METALS (continued)

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

THE LEADER IN ENVIRONMENTAL TESTING

END OF REPORT

April 04, 2008

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A8C140216
Sample date: 2008-03-13
Report received by Enovis: 2008-03-28
Initial Data Verification completed by Enovis: 2008-04-04

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Water samples were analyzed for GCMS VOC, GCMS SVOC, PCB, Wisconsin GRO and Wisconsin DRO, Metals and Free Cyanide parameters and 2 Trip Blanks for GCMS VOC parameters. Refer to the attached Sampling and Analysis Summary table.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time were reviewed as part of our verification.

Free Cyanide was subcontracted to TA-Savannah and reported under submittal 35083-1.

2 Trip Blanks were reported with this submittal. Refer to the minor QC exceptions listed below.

Analytical results reported between the MDL and RDL are flagged J and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC LCS/LCSD for 1,1,2,2-Tetrachloroethane recovered low outside of the labs acceptance window in QC batch 8080146. The associated results for A8C140216-001, 2, 3, 4, 5, 6, 7 and 8 were reported non-detect and are flagged UJ and considered estimated.

GCMS VOC LCS for trans-1,3-Dichloropropene recovered low outside of the labs acceptance window in QC batch 8080146. The LCSD recovered in control. The LCS/LCSD RPD was within limits. No qualification required.

GCMS VOC LCSD for 1,1,2-Trichloro-1,2,2-trifluoroethane, Trichlorofluoromethane and cis-1,2-Dichloroethene recovered high outside of the labs acceptance window in QC batch 8080146. The LCS recovered in control. The LCS/LCSD RPD was within limits. No qualification required.

GCMS VOC Method Blank for Acetone and 1,2,3-Trichlorobenzene were reported between the MDL and RDL in QC batch 8080146. Acetone was also reported in Trip Blanks -01 and -02 at the same concentration and higher than the method blank. The associated sample results for A8C140216-002, 3, 4, 5 and 7 were reported less than 10x the Trip Blank concentration and are flagged UB and considered non-detect at the RDL. The associated results for 1,2,3-Trichlorobenzene were all reported non-detect. No qualification required.

GCMS SVOC LCS/LCSD for Caprolactam recovered low outside of the labs acceptance window in QC batch 8077094. The associated result for A8C140216-005 was reported non-detect and is flagged UJ and considered estimated.

GCMS SVOC LCS/LCSD RPD for 2,4-Dinitrophenol was above the labs acceptance limit. Both the LCS and LCSD recovered in control. No qualification required.

DRO surrogate C9 recovered high outside of the labs acceptance window in samples A8C140216-001, 2, 3, 5, 7 and Method Blank and LCS/LCSD for QC batch 8081123. The surrogate recoveries for this method are only advisory. No qualification required.

DRO LCS/LCSD recovered low outside of the labs acceptance window in QC batch 8075016. The samples were re-extracted 1 day out of hold time in QC batch 8081123. The re-extract results are higher than the original results associated with the low LCS/LCSD. Enovis recommends that the re-extract results be utilized. The re-extract results are flagged J due to hold time exceedence. The original results are flagged R to indicate which results to use.

DRO Method Blank result reported between the MDL and RDL in QC batch 8081123. The associated result for A8C140216-001, 2, 3, 5 and 7 were reported above the RDL and greater than 5x the method blank concentration. No qualification required.

Metals Method Blank for Barium was reported between the MDL and RDL in QC batch 8077023. The associated sample results were all reported between the MDL and RDL and greater than 10x the method blank concentration. No qualification required.

Free Cyanide MS recovered high outside of the labs acceptance window in QC batch 101167. The MSD recovered in control. The MS/MSD RPD was in control. The sample was project specific 680-35-83-1. No qualification required.

Evaluation of blank contamination includes directions on the interpretation of the affected analytical results; however it is beyond the scope of Enovis verification to apply changes to the result and quantitation limit in the Ford Master Analytical database. The end data user must implement any corrections to the electronic data downloaded from the Enovis CLMS based on project requirements.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than
>	Greater than
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JB	The analyte / compound was detected in the associated blank between the MDL and the laboratory`s reporting detection limit. For Inorganic methods the sample concentration was < 10x the blank concentration and is considered estimated. For Organic methods the sample concentration was < 5x or 10x for common laboratory contaminates, the blank concentration and is considered estimated.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

CASE NARRATIVE

A8C140216

The following report contains the analytical results for six water samples and two quality control samples submitted to TestAmerica North Canton by ARCADIS Geraghty & Miller, Inc. from the Ford Twin Cities Pha B E200572 Site, project number FORD-TCAP-03 E200575-2. The samples were received March 14, 2008, according to documented sample acceptance procedures.

The ASTM D4282-89 Free Cyanide analysis was performed at the TestAmerica Savannah laboratory.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

Any reference within this document to Severn Trent Laboratories, Inc. or STL, should be understood to refer to TestAmerica Laboratories, Inc. (formerly known as Severn Trent Laboratories, Inc.)

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 132.

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 3.6, 3.8, 4.1 and 4.1°C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 8080146 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8075065 and 8077094. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

Batch(es) 8077094 had recoveries and/or RPD’s out high in the LCS. Since there were no hits detected in any of the associated samples, no corrective action was necessary.

CASE NARRATIVE (continued)

GASOLINE RANGE ORGANICS

The analytical results met the requirements of the laboratory's QA/QC program.

POLYCHLORINATED BIPHENYLS-8082

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8075061. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

DIESEL RANGE ORGANICS

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8075016 and 8081123. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

For the reextract sample(s) AMW-07 (20080313), AMW-10 (20080313), AMW-02 (20080313), AMW-08 (20080313), and the Blank, LCS/LCSD associated with batch(es) 8081123, the surrogates failed criteria high. Since the limits are advisory only for DRO, no further action was required.

The LCS/LCSD associated with batch(es) 8075016 failed criteria low. The entire batch was sent back for reextraction outside of the recommended holding time; therefore, both batches have been reported.

CASE NARRATIVE (continued)

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

The QC batch 8077023 was reported without an MS/MSD. The MS/MSD was performed on another client's sample within the batch. The MS/MSD result does not have immediate bearing on any samples except for the actual sample spiked. Ongoing evaluation and monitoring of the LCS provides long-term precision and accuracy for the method.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY - Detection Highlights

A8C140216

PARAMETER	RESULT	REPORTING LIMIT	UNITS	ANALYTICAL METHOD
AMW-08(20080313) 03/13/08 14:55 007				
Diesel Range Organics	0.79 B	0.10	mg/L	WI-DRO DRO
Diesel Range Organics	0.58	0.10	mg/L	WI-DRO DRO
Barium - DISSOLVED	105 B,J	200	ug/L	SW846 6010B
Acetone	2.9 J,B	10	ug/L	SW846 8260B
Carbon disulfide	0.33 J	1.0	ug/L	SW846 8260B
TB-002(20080313) 03/13/08 008				
Acetone	7.8 J,B	10	ug/L	SW846 8260B
Methylene chloride	2.0	1.0	ug/L	SW846 8260B

ANALYTICAL METHODS SUMMARY

A8C140216

PARAMETER	ANALYTICAL METHOD
Diesel Range Organics	WI-DRO DRO
Gasoline Range Organics	WI-GRO GRO
Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A
PCBs by SW-846 8082	SW846 8082
Semivolatile Organic Compounds by GC/MS	SW846 8270C
Trace Inductively Coupled Plasma (ICP) Metals	SW846 6010B
Volatile Organics by GC/MS	SW846 8260B

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

ANALYTICAL REPORT

Job Number: 680-35083-1

Job Description: Ford - TCAP MN (Arcadis)

For:
TestAmerica Laboratories, Inc.
4101 Shuffel Street NW
North Canton, OH 44720

Attention: Mrs. Denise Pohl

Lidya Gulizia
Project Manager I
lidya.gulizia@testamericainc.com
03/26/2008

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Project Manager who signed this report.

Job Narrative
Savannah Job No. 680-J35083-1 / No. Canton Lot A8C140216

Receipt
No additional sample containers were submitted to perform a matrix spike / matrix spike duplicate (MS/MSD) or a sample duplicate.

All samples were received in good condition within temperature requirements.

General Chemistry
The recovery for the matrix spike (MS) sample conducted on lab sample 35083-1 for the analysis of free cyanide was above the upper control limit. The recovery for the MS was flagged F to denote that the recovery exceeded the quality control limit.

Comments
No additional comments.

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A8I120347
Sample date: 2008-09-10
Report received by Enovis: 2008-10-03
Initial Data Verification completed by Enovis: 2008-10-08

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GRO, DRO and Metals parameter(s). 1 Trip Blank sample(s) were analyzed for GCMS VOC parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Trip Blank result for Acetone reported. Refer to the minor QC exception listed below.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC LCS/LCSD for 1,1,2,2-Tetrachloroethane and cis-1,3-Dichloropropene recovered slightly low outside of the labs acceptance window in QC batch 8262193. All recoveries were greater than 80%. Based on professional judgment no qualification is required.

GCMS VOC LCS for 1,2,3-Trichloropropene, Ethylbenzene and Naphthalene recovered low outside of the labs acceptance window in QC batch 8262193. The LCSD spike and LCS/LCSD RPD are in control. No qualification required.

GCMS VOC MS/MSD for 1,1,2,2-Tetrachloroethane, 2,2-Dichloropropane, cis-1,3-Dichloropropene, Ethylbenzene, Styrene, Trichlorofluoromethane and Vinyl chloride recovered low outside of the labs acceptance window in QC batch 8260041. The sample is project specific A8I20347-001. The sample results are reported non-detect and flagged UJ and considered estimated.

GCMS VOC MS for 1,1-Dichloroethane, 1,2,4-Trichlorobenzene, 1,2-Dichloropropane, Cyclohexane, Methylcyclohexane, n-Butylbenzene, Naphthalene and tert-Butylbenzene recovered low outside of the labs acceptance window in QC batch 8260041. The MSD spike and MS/MSD RPD are in control. No qualification required.

GCMS VOC Trip Blank for Acetone reported between the MDL and RDL. The associate field sample result is reported non-detect. No qualification required.

GCMS SVOC LCS and MS/MSD for Hexachlorocyclopentadiene recovered low outside of the labs acceptance window in QC batch 8260041. The MS/MSD is project specific A8I120347-001. The sample result is reported non-detect and is flagged UJ and considered estimated.

GCMS SVOC Method Blank for bis(2-Ethylhexyl) phthalate is reported between the MDL and RDL in QC batch 8260041. The associated result for A8i120347-001 is reported between the MDL and RDL and less than 10x the method blank concentration and is flagged UB and considered non-detect at the RDL.

PCB Surrogate DCB recovered high outside of the labs acceptance window in the Method Blank for QC batch 8257090. The second surrogate recovered in control to meet method criteria. No qualification required.

PCB MS/MSD for PCB-1260 recovered high outside of the labs acceptance window in QC batch 8257090. The sample is project specific A8I120347-001. In the case narrative the lab notes that the closing CCV associated with the MS/MSD failed high. The sample results is reported non-detect. No qualification required.

GRO MS/MSD recovered low outside of the labs acceptance window in QC batch 8261404. The sample is project specific A8I120347-001. The sample result is reported non-detect and is flagged UJ and considered estimated.

DRO Surrogate C9 recovered high outside of the labs acceptance window in samples A8I120347-001, 1MS, 1MSD, Method Blank and LCS/LCSD for QC batch 8259037. The method does not require surrogates. No qualification required.

DRO Method Blank reported a concentration between the MDL and RDL in QC batch 8259037. The associated result for A8I120347-001 is reported between the MDL and RDL and less than 5x the method blank concentration and is flagged UB and considered non-detect at the RDL.

Metals Method Blank for Barium is reported between the MDL and RDL in QC batch . The associated result fo rA8I120347-001 is reported between the MDL and RDL and greater than 10x the method blank concentration and is flagged J as an estimated value. No further qualification required.

Evaluation of blank contamination includes directions on the interpretation of the affected analytical results; however it is beyond the scope of Enovis verification to apply changes to the result and quantitation limit in the Ford Master Analytical database. The end data user must implement any corrections to the electronic data downloaded from the Enovis CLMS based on project requirements.

Enovis does not have enough information regarding the nature and consistency of the investigative field samples to apply the valid qualifiers to additional samples beyond the parent sample for the MS/MSD outlier. The end data user must determine whether or not to extend qualification based on knowledge of the investigative field samples and project requirements.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

CASE NARRATIVE

A8I120347

The following report contains the analytical results for two water samples submitted to TestAmerica North Canton by ARCADIS Geraghty & Miller, Inc. from the Ford-TCAP-03/E200572 Site, project number MN000593.5. The samples were received September 12, 2008, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

Any reference within this document to Severn Trent Laboratories, Inc. or STL, should be understood to refer to TestAmerica Laboratories, Inc. (formerly known as Severn Trent Laboratories, Inc.)

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were 0.4, 1.3, and 2.0°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for AMW-05B(20080910) had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

GC/MS SEMIVOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for AMW-05B(20080910) had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

GASOLINE RANGE ORGANICS

The matrix spike/matrix spike duplicate(s) for AMW-05B(20080910) had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

POLYCHLORINATED BIPHENYLS-8082

The matrix spike/matrix spike duplicate(s) for AMW-05B(20080910) had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

CASE NARRATIVE (continued)

POLYCHLORINATED BIPHENYLS-8082 (continued)

Surrogate recoveries were outside criteria; since the method criterion is that one of two surrogate compounds must meet acceptance criteria, no corrective action was required for sample(s) Blank for batch(es) 8257090.

The closing CCV failed high for sample(s) AMW-05B(20080910)MS, and AMW-05B (20080910)MSD; since the sample(s) were non-detect (or J flag values), no corrective action is needed.

DIESEL RANGE ORGANICS

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The surrogate was outside of acceptance criteria for sample(s) Blank, LCS for batch(es) 8259037, AMW-05B(20080910), AMW-05B(20080910)MS, and AMW-05B (20080910)MSD. The method does not require a surrogate; therefore, no corrective action was necessary.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

No ICP Trace Form IX was provided for batch(es) 8259014. The serial dilution was performed on a different sample from the same QC batch(es).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

SAMPLE SUMMARY

SAMPLE SUMMARY

A8I120347

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
KWTK1	001	AMW-05B(20080910)	09/10/08	12:35
KWTLD	002	TB-001(20080910)	09/10/08	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Client ARCADIS Project _____ By: _____
Cooler Received on 9-12-08 Opened on 9-12-08 (Signature)
FedEx ☑ UPS ☐ DHL ☐ FAS ☐ Stetson ☐ Client Drop Off ☐ TestAmerica Courier ☐ Other _____
TestAmerica Cooler # _____ Multiple Coolers ☑ Foam Box ☐ Client Cooler ☐ Other _____

1. Were custody seals on the outside of the cooler(s)? Yes ☐ No ☑ Intact? Yes ☐ No ☐ NA ☑
   If YES, Quantity_____ Quantity Unsalvageable_____
   Were custody seals on the outside of cooler(s) signed and dated? Yes ☐ No ☐ NA ☑
   Were custody seals on the bottle(s)? Yes ☐ No ☑
   If YES, are there any exceptions? _____
2. Shippers' packing slip attached to the cooler(s)? Yes ☑ No ☐
3. Did custody papers accompany the sample(s)? Yes ☑ No ☐ Relinquished by client? Yes ☑ No ☐
4. Were the custody papers signed in the appropriate place? Yes ☑ No ☐
5. Packing material used: Bubble Wrap ☑ Foam ☐ None ☐ Other _____
6. Cooler temperature upon receipt _____ °C See back of form for multiple coolers/temps ☑
   METHOD: IR ☑ Other ☐ _____
   COOLANT: Wet Ice ☑ Blue Ice ☐ Dry Ice ☐ Water ☐ None ☐
7. Did all bottles arrive in good condition (Unbroken)? Yes ☑ No ☐
8. Could all bottle labels be reconciled with the COC? Yes ☑ No ☐
9. Were sample(s) at the correct pH upon receipt? Yes ☑ No ☐ NA ☐
10. Were correct bottle(s) used for the test(s) indicated? Yes ☑ No ☐
11. Were air bubbles >6 mm in any VOA vials? Yes ☐ No ☑ NA ☐
12. Sufficient quantity received to perform indicated analyses? Yes ☑ No ☐
13. Was a trip blank present in the cooler(s)? Yes ☑ No ☐ Were VOAs on the COC? Yes ☑ No ☐

Contacted PM _____ Date _____ by _____ via Verbal ☐ Voice Mail ☐ Other ☐
Concerning _____

14. CHAIN OF CUSTODY

The following discrepancies occurred:

_____

_____

_____

_____

_____

_____

15. SAMPLE CONDITION

Sample(s)_____ were received after the recommended holding time had expired.
Sample(s)_____ were received in a broken container.
Sample(s)_____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot# 031808-HNO_3; Sulfuric Acid Lot# 031808-H_2SO_4; Sodium Hydroxide Lot# 073007 -NaOH; Hydrochloric Acid Lot# 092006-HCl; Sodium Hydroxide and Zinc Acetate Lot# 050205-$(CH_3COO)_2ZN$/NaOH.* What time was preservative added to sample(s)? _____

END OF REPORT

October 02, 2008

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A8I160306
Sample date: 2008-09-15
Report received by Enovis: 2008-10-01
Initial Data Verification completed by Enovis: 2008-10-02

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

1 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other and Metals parameter(s). 1 Trip Blank were analyzed for GCMS VOC parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Refer to the attached Sampling and Analysis Summary table.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC LCS/LCSD for Bromomethane and Styrene recovered low outside of the labs acceptance window in QC batch 8266108. The associated results for A8I160306-001 and 2 are reported non-detect and are flagged UJ and considered estimated.

GCMS VOC LCS for 1,1,1-Trichloroethane, 1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,1-Dichloroethane, Bromodichloromethane, Chlorodibromomethane, Chloroform, cis-1,2-Dichloroethene, cis-1,3-Dichloropropene, Cyclohexane, Ethylbenzene, Methylcyclohexane, Tetrachloroethene and trans-1,3-Dichloropropene recovered low outside of the labs acceptance window in QC batch 8266108. The LCSD spikes and LCS/LCSD RPD are in control. No qualification required.

GCMS VOC LCSD 1,2,4-Trichlorobenzene and Hexachlorobutadiene recovered low outside of the labs acceptance window in QC batch 8266108. The LCS spike and LCS/LCSD RPD are in control. No qualification required.

GCMS SVOC Method Blank for bis(2-Ethylhexyl) phthalate is reported between the MDL and the RDL in QC batch 50. The associated result for A8I160306-001 is reported between the MDL and RDL and less than 10x the method blank concentration and is flagged UB and considered non-detect at the RDL.

DRO Surrogate C9 in sample A8I160306-001 and the Method Blank, LCS and LCSD in QC batch 8262056 were not surrogated. The method does not require use of a surrogate. No qualification required.

The preserved sample aliquot of sample A8I160306-001 for DRO was consumed due to a laboratory accident. An unpreserved aliquot was used for the extraction. The sample was extracted within the holding time for unpreserved samples. No qualification required.

Metals Method Blank for Barium reported between the MDL and RDL in QC batch 8261012. The associated result for A8I160306-001 is reported above the RDL and greater than 10x the method blank concentration. No qualification required.

Evaluation of blank contamination includes directions on the interpretation of the affected analytical results; however it is beyond the scope of Enovis verification to apply changes to the result and quantitation limit in the Ford Master Analytical database. The end data user must implement any corrections to the electronic data downloaded from the Enovis CLMS based on project requirements.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Tim Abston

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A8I160306

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica North Canton by ARCADIS Geraghty & Miller, Inc. from the Ford Twin Cities MN Site. The samples were received September 16, 2008, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

Any reference within this document to Severn Trent Laboratories, Inc. or STL, should be understood to refer to TestAmerica Laboratories, Inc. (formerly known as Severn Trent Laboratories, Inc.)

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT." The total number of pages in this report is 59.

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 0.8°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 8266108 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

GC/MS SEMIVOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8262050. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

GASOLINE RANGE ORGANICS

The matrix spike/matrix spike duplicate(s) for batch(es) 8261404 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

CASE NARRATIVE (continued)

POLYCHLORINATED BIPHENYLS-8082

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8261351. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

DIESEL RANGE ORGANICS

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 8262056. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

Due to a laboratory accident, the preserved liter of sample(s) AMW-07(20080915) was consumed; therefore, it was necessary to use an unpreserved liter to extract this sample.

The entire batch 8262056 was not surrogated. The method does not require a surrogate, therefore there was no additional corrective action for sample(s) AMW-07(20080915).

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica North Canton conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY - Detection Highlights

A8I160306

PARAMETER	RESULT	REPORTING LIMIT	UNITS	ANALYTICAL METHOD
AMW-07(20080915) 09/15/08 09:35 001				
Diesel Range Organics	0.21	0.10	mg/L	WI-DRO DRO

SAMPLE SUMMARY

A8I160306

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
KW08G	001	AMW-07(20080915)	09/15/08	09:35
KW085	002	TB-01(20080915)	09/15/08	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-5928-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 11/15/2011; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt was 2.3, 2.6 and 2.8 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2), DUP-01 (240-5928-3) and TRIP BLANK (240-5928-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 11/18/2011 and 11/23/2011.

1,2,3-Trichlorobenzene, Methylene Chloride and Naphthalene were detected in method blank MB 240-24524/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

Method(s) 8260B: The following sample(s) submitted for volatiles analysis was received with insufficient preservation (pH >2): AMW-20 (240-5928-2), DUP-01 (240-5928-3).

No other difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2) and DUP-01 (240-5928-3) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 11/17/2011 and analyzed on 11/21/2011.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Several analytes failed the recovery criteria low for the MS of sample AMW-19MS (240-5928-1) in batch 240-24168.

Several analytes failed the recovery criteria low for the MSD of sample AMW-19MSD (240-5928-1) in batch 240-24168. Dibenz(a,h)anthracene exceeded the rpd limit.

Refer to the QC report for details.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the SVOC analyses.

All other quality control parameters were within the acceptance limits.

WISCONSIN DRO

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2) and DUP-01 (240-5928-3) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 11/17/2011 and analyzed on 11/18/2011.

WI Diesel Range Organics (C10-C28) was detected in method blank MB 240-23759/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

No other difficulties were encountered during the WI-DRO analyses.

All other quality control parameters were within the acceptance limits.

WISCONSIN GRO

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2) and DUP-01 (240-5928-3) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 11/17/2011.

Method(s) WI-GRO: The following samples submitted for volatiles analysis were received with insufficient preservation (pH >2): AMW-19 (240-5928-1), AMW-20 (240-5928-2), DUP-01 (240-5928-3).

No other difficulties were encountered during the WI-GRO analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2) and DUP-01 (240-5928-3) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 11/18/2011 and analyzed on 11/21/2011 and 11/22/2011.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

Several analytes were detected in method blank MB 240-23930/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

DISSOLVED MERCURY (CVAA)

Samples AMW-19 (240-5928-1), AMW-20 (240-5928-2) and DUP-01 (240-5928-3) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 11/17/2011 and analyzed on 11/21/2011.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-5928-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	F	RPD of the MS and MSD exceeds the control limits
GC Semi VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.6, 2.3, 2.8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000440.0001.00005
Laboratory: TestAmerica - North Canton
Laboratory submittal: 5928-1
Sample date: 2011-11-11
Report received by Enovis: 2011-11-30
Initial Data Verification completed by Enovis: 2011-12-02

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) and 1 field duplicate were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC method blank for QC batch 24524 had detections below the RL for 1,2,3-trichlorobenzene, methylene chloride and naphthalene. Client sample -004 (trip blank) results for these analytes should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank detections for 1,2,3-trichlorobenzene, naphthalene and methylene chloride were qualified as non-detect at the RL due to associated method blank detections. No other detections were reported in the trip blank.

GCMS VOC client samples -002 and -003 and GRO client samples -001, -002 and -003 containers were received at a pH of greater than 2 so were outside of the recommended preservation criteria for the standard 14 day holding time. The associated analyses were performed within 7 days of sample collection so qualification was not required based on the preservation non-conformances.

GCMS SVOC MS/MSD recoveries performed on client sample -001 were outside of laboratory control limits biased low for benzo(a)anthracene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(a)pyrene, chrysene, dibenzo(ah)anthracnene (MS/MSD RPD also an outlier) and indeno(1,2,3-cd)pyrene. Client sample -001 results for these analytes should be considered to be estimated and qualified with UJ flags. MS only recovery outliers for benzo(k)fluoranthene and pyrene did not result in qualification of client sample data.

DRO method blank detection below the RL did not result in qualification for client sample data.

Metals method blank had detections below the RL for potassium, barium, arsenic, beryllium, calcium, magnesium, manganese and zinc. Client samples -001, -002 and -003 arsenic and beryllium results should be considered to be non-detect at the RL and qualified with UB flags.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

01/31/2012

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP- E200572- DE000440.0002.00005

Report Number: 240-7777-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 01/19/2012; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 0.2, 0.8, 1.3 and 1.8C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2), DUP-02 (240-7777-3) and TB-(20120117)-01 (240-7777-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 01/23/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-31076/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2) and DUP-02 (240-7777-3) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 01/20/2012 and analyzed on 01/24/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Terphenyl-d14 (Surr) failed the surrogate recovery criteria low for AMW-19MSD (240-7777-1MSD). Refer to the QC report for details.

Several analytes failed the recovery criteria low for the MS/MSD of sample AMW-19MS (240-7777-1) in batch 240-31131.

Benzo[a]pyrene exceeded the rpd limit.

Refer to the QC report for details.

Several analytes failed the recovery criteria low for the MSD of sample AMW-19MSD (240-7777-1) in batch 240-31304. Benzo[a]pyrene exceeded the rpd limit.

Refer to the QC report for details.

No other difficulties were encountered during the SVOC analyses.

All other quality control parameters were within the acceptance limits.

WISCONSIN DRO

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2) and DUP-02 (240-7777-3) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 01/20/2012 and analyzed on 01/24/2012.

WI Diesel Range Organics (C10-C28) exceeded the rpd limit for LCSD 240-30867/3-A. Refer to the QC report for details.

Method(s) WI-DRO: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 30867 exceeded control limits for the following analytes: diesel range organics C10 - C28.

No other difficulties were encountered during the WI-DRO analyses.

All other quality control parameters were within the acceptance limits.

WISCONSIN GRO

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2) and DUP-02 (240-7777-3) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 01/26/2012.

No difficulties were encountered during the WI-GRO analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2) and DUP-02 (240-7777-3) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 01/23/2012 and analyzed on 01/25/2012.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

Several analytes were detected in method blank MB 240-31087/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

DISSOLVED MERCURY (CVAA)

Samples AMW-19 (240-7777-1), AMW-20 (240-7777-2) and DUP-02 (240-7777-3) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 01/20/2012 and analyzed on 01/25/2012.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-7777-1

Lab Section	Qualifier	Description
GC/MS VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	F	RPD of the MS and MSD exceeds the control limits
	X	Surrogate is outside control limits
GC Semi VOA		
	*	RPD of the LCS and LCSD exceeds the control limits
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	0.8/1.3/1.8/0.2
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

07/18/2014

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-39273-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 7/8/2014 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.2º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-07 (20140703) (240-39273-1), AMW-05 (20140703) (240-39273-2), AMW-05B (20140703) (240-39273-3) and TRIP BLANK-01 (20131217) (240-39273-4) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 07/11/2014.

Methylene Chloride was detected in method blank MB 240-138130/5 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Methylene Chloride failed the recovery criteria high for LCS 240-138130/4. Refer to the QC report for details.

Method(s) 8260B: The laboratory control sample (LCS) for batch 138130 recovered outside control limits for the following analytes: Methylene Chloride. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: No MS/MSD in batch 138130 due to sample re-analysis.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample AMW-07 (20140703) (240-39273-1) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 07/09/2014 and analyzed on 07/12/2014.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 137710.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-07 (20140703) (240-39273-1), AMW-05 (20140703) (240-39273-2) and AMW-05B (20140703) (240-39273-3) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 07/09/2014 and analyzed on 07/10/2014.

Barium, Calcium, Magnesium and Zinc were detected in method blank MB 240-137747/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-07 (20140703) (240-39273-1), AMW-05 (20140703) (240-39273-2) and AMW-05B (20140703) (240-39273-3) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 07/09/2014 and analyzed on 07/10/2014.

Mercury failed the recovery criteria low for the MS/MSD of sample 240-39290-1 in batch 240-138051. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-39273-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	F1	MS and/or MSD Recovery exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
