Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 39273-1
Sample date: 2014-07-03
Report received by CADENA: 2014-07-18
Initial Data Verification completed by CADENA: 2014-07-22

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

3 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

MS/MSD recovery data was not available for GCMS VOC QC batch 138130 due to re-analysis and in GCMS SVOC QC batch 137710 due to insufficient sample volume provided.

GCMS VOC QC batch 138130 method blank had detections above the RL for methylene chloride. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC trip blank was non-detect for all target analytes.

GCMS VOC QC batch 138130 LCS recoveries were outliers biased high for methylene chloride. Qualification of client sample non-detect results were not required based on these high bias QC outliers.

Metals QC batch 137747 method blank had detections below the RL for barium, calcium, magnesium and zinc. Client samples -002 and -003 zinc results should be considered to be non-detect at the RL and qualified with UB flags.

Metals QC batch 137751 MS/MSD recovery outliers were not determined using a sample from this submittal. Qualification of client sample results was not required based on these sample-specific QC outliers.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the CADENA CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

ANALYTICAL REPORT

Job Number: 240-40552-1

Job Description: Ford TCAP - E200572

For:
ARCADIS U.S., Inc.
430 First Avenue, North
Suite 720
Minneapolis, MN 55304

Attention: Ms. Angharad Pagnon

Approved for release.
Denise Pohl
Project Manager II
8/21/2014 5:15 PM

Denise Pohl, Project Manager II
4101 Shuffel Street NW, North Canton, OH, 44720
(330)966-9789
denise.pohl@testamericainc.com
08/21/2014

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-40552-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 8/9/2014 9:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.8º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-05B (20140806) (240-40552-1), EB-001 (20140806) (240-40552-2), AMW-05 (20140807) (240-40552-3), AMW-19 (20140807) (240-40552-4), AMW-20 (20140807) (240-40552-5), DUP-002 (20140807) (240-40552-6), TRIP BLANK (240-40552-7) and AMW-07 (20140807) (240-40552-8) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 08/14/2014.

Acetone and Tetrahydrofuran were detected in method blank MB 240-142797/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

1,1,2-Trichloro-1,2,2-trifluoroethane failed the recovery criteria low for the MS/MSD of sample 240-40483-9 in batch 240-142797. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample AMW-07 (20140807) (240-40552-8) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 08/13/2014 and analyzed on 08/14/2014.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 142593.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-05B (20140806) (240-40552-1), AMW-05 (20140807) (240-40552-3), AMW-19 (20140807) (240-40552-4), AMW-20 (20140807) (240-40552-5), DUP-002 (20140807) (240-40552-6) and AMW-07 (20140807) (240-40552-8) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 08/12/2014 and analyzed on 08/13/2014.

Barium, Calcium, Magnesium, Thallium and Zinc were detected in method blank MB 240-142428/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-05B (20140806) (240-40552-1), AMW-05 (20140807) (240-40552-3), AMW-19 (20140807) (240-40552-4), AMW-20 (20140807) (240-40552-5), DUP-002 (20140807) (240-40552-6) and AMW-07 (20140807) (240-40552-8) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 08/12/2014 and analyzed on 08/14/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-40552-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	F1	MS and/or MSD Recovery exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time
Metals		
	B	Compound was found in the blank and sample.
	4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 40552-1
Sample date: 2014-08-07 2014-08-06
Report received by CADENA: 2014-08-21
Initial Data Verification completed by CADENA: 2014-08-23

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

7 Water sample(s) and 1 trip blank were analyzed for GCMS VOC, GCMS SVOC and Metals parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

EPA 8260B VOC GCMS, batch 142797 MB had detections below RL for acetone and tetrahydrofuran (THF). Based on these detections, client sample results for THF do not require qualification; acetone results for sample -2, -3 and -7 should be considered not-detect and flagged UB.
EPA 6010B metals ICP, batch 142428 MB had detections below RL for barium, calcium, magnesium, thallium and zinc. Based on these detections, client sample -1, -6 and -8 results for thallium should be considered not-detect and flagged UB; client sample -1 and -3 results for zinc should be considered not-detect and flagged UB.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the CADENA CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

ANALYTICAL REPORT

Job Number: 240-42049-1

Job Description: Ford TCAP - E200572

For:
ARCADIS U.S., Inc.
430 First Avenue, North
Suite 720
Minneapolis, MN 55304

Attention: Ms. Angharad Pagnon

Approved for release.
Denise Pohl
Project Manager II
9/25/2014 8:21 AM

Denise Pohl, Project Manager II
4101 Shuffel Street NW, North Canton, OH, 44720
(330)966-9789
denise.pohl@testamericainc.com
09/25/2014

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-42049-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 9/18/2014 7:50 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-19 (20140916) (240-42049-1), AMW-20 (20140916) (240-42049-2), AMW-05 (20140916) (240-42049-3), AMW-07 (20140916) (240-42049-4), DUP-003 (20140916) (240-42049-5), EB-02 (20140916) (240-42049-6) and TRIP BLANK (240-42049-7) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 09/23/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample AMW-07 (20140916) (240-42049-4) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 09/22/2014 and analyzed on 09/23/2014.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-19 (20140916) (240-42049-1), AMW-20 (20140916) (240-42049-2), AMW-05 (20140916) (240-42049-3), AMW-07 (20140916) (240-42049-4) and DUP-003 (20140916) (240-42049-5) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 09/19/2014 and analyzed on 09/22/2014.

Iron, Manganese and Sodium were detected in method blank MB 240-147761/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-19 (20140916) (240-42049-1), AMW-20 (20140916) (240-42049-2), AMW-05 (20140916) (240-42049-3), AMW-07 (20140916) (240-42049-4) and DUP-003 (20140916) (240-42049-5) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 09/19/2014 and analyzed on 09/22/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

1. ~~Cooler temperature upon receipt~~

IR GUN# A	(CF +2 °C)	Observed Cooler Temp. ____ °C	Corrected Cooler Temp. ____ °C	☐ See Multiple Cooler Form
IR GUN# 4	(CF -2 °C)	Observed Cooler Temp. ____ °C	Corrected Cooler Temp. ____ °C	
IR GUN# 5	(CF 0 °C)	Observed Cooler Temp. ____ °C	Corrected Cooler Temp. ____ °C	
IR GUN# 8	(CF 0 °C)	Observed Cooler Temp. 2.4 °C	Corrected Cooler Temp. 2.4 °C	

2. Were custody seals on the outside of the cooler(s)? If Yes Quantity ____ Yes (No)
   -Were custody seals on the outside of the cooler(s) signed & dated? Yes No (NA)
   -Were custody seals on the bottle(s)? Yes (No)
3. Shippers' packing slip attached to the cooler(s)? (Yes) No
4. Did custody papers accompany the sample(s)? (Yes) No
5. Were the custody papers relinquished & signed in the appropriate place? (Yes) No
6. Did all bottles arrive in good condition (Unbroken)? (Yes) No
7. Could all bottle labels be reconciled with the COC? (Yes) No
8. Were correct bottle(s) used for the test(s) indicated? (Yes) No
9. Sufficient quantity received to perform indicated analyses? (Yes) No
10. Were sample(s) at the correct pH upon receipt? (Yes) No NA pH Strip Lot# HC412469
11. Were VOAs on the COC? (Yes) No
12. Were air bubbles >6 mm in any VOA vials? Yes (No) NA
13. Was a trip blank present in the cooler(s)? (Yes) No

Contacted PM DJP Date 9/18/14 by QB via Verbal Voice Mail (Other) email

Concerning trip blank

14. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES — Samples processed by: DT

Received 3 Voa vials, without labels, by process of elimination the vials are EB-02

EB-02 on COC has no marked tests

Received 1x40 trip blank not on coc, will log.

15. SAMPLE CONDITION

Sample(s) ____ were received after the recommended holding time had expired.

Sample(s) ____ were received in a broken container.

Sample(s) ____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) ____ were further preserved in the laboratory.

Time preserved: ____ Preservative(s) added/Lot number(s): ____

Temperature readings: _____

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 42049-1
Sample date: 2014-09-16
Report received by CADENA: 2014-09-25
Initial Data Verification completed by CADENA: 2014-09-25

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

Metals method blank had detections below the RL for iron, manganese and sodium. Client samples -001, -004 and -005 iron results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank had a detection below the RL for chloroform. Qualification of client sample results was not required based on this trip blank detection.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the CADENA CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

ANALYTICAL REPORT

Job Number: 240-61699-1

Job Description: Ford TCAP - E200572

For:
ARCADIS U.S., Inc.
28550 Cabot Drive
Suite 500
Novi, MI 48377

Attention: Kristoffer Hinskey

Approved for release.
Denise Pohl
Project Manager II
3/8/2016 2:11 PM

Denise Pohl, Project Manager II
4101 Shuffel Street NW, North Canton, OH, 44720
(330)966-9789
denise.pohl@testamericainc.com
03/08/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-61699-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 3/4/2016 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.7º C and 1.1º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-27_20160302 (240-61699-1), AMW-28_20160302 (240-61699-2), AMW-29_20160303 (240-61699-3), AMW-30_20160303 (240-61699-4), AMW-31_20160303 (240-61699-5), DUP-1 (240-61699-6) and TRIP BLANK (240-61699-7) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/07/2016.

Several analytes failed the recovery criteria low for the MSD of sample 240-61588-3 in batch 240-220480. Several analytes exceeded the RPD limit. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-27_20160302 (240-61699-1), AMW-28_20160302 (240-61699-2), AMW-29_20160303 (240-61699-3), AMW-30_20160303 (240-61699-4), AMW-31_20160303 (240-61699-5) and DUP-1 (240-61699-6) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 03/05/2016 and analyzed on 03/07/2016.

Method(s) WI-DRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the WI Diesel Range Organics (C10-C28) : AMW-31_20160303 (240-61699-5) and DUP-1 (240-61699-6).

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-220349.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-27_20160302 (240-61699-1), AMW-28_20160302 (240-61699-2), AMW-29_20160303 (240-61699-3), AMW-30_20160303 (240-61699-4), AMW-31_20160303 (240-61699-5) and DUP-1 (240-61699-6) were analyzed for dissolved metals

(ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/04/2016 and analyzed on 03/07/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Several analytes were detected in method blank MB 240-220200/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

DISSOLVED MERCURY (CVAA)

Samples AMW-27_20160302 (240-61699-1), AMW-28_20160302 (240-61699-2), AMW-29_20160303 (240-61699-3), AMW-30_20160303 (240-61699-4), AMW-31_20160303 (240-61699-5) and DUP-1 (240-61699-6) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/04/2016 and analyzed on 03/07/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-61699-1

Lab Section	Qualifier	Description
GC/MS VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

March 09, 2016

Rob Ellis
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 61699-1
Sample date: 2016-03-02 2016-03-03
Report received by CADENA: 2016-03-08
Initial Data Verification completed by CADENA: 2016-03-09

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 220480 MS recovery outliers were not determined using samples from this submittal so qualification of client sample results was not required based on these sample-specific QC outliers.

WI-DRO QC did not include surrogate recoveries or batch 2203349 QC MS recovery data (due to insufficient sample volume available for spiking).

Meals QC batch 220200 method blank had detections below the RL for barium, calcium, magnesium, manganese, sodium and zinc. Client sample -004 zinc result should be considered to be non-detect at the concentration reported and qualified with a B flag and samples -001 and -002 zinc results non-detect at the RL and qualified with UB flags.

GCMS VOC trip blank was non-detect for all target analytes.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Water sample(s) were analyzed for GCMS VOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values. Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia, Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

03/24/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-61960-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 3/10/2016 11:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.3º C, 0.7º C, 0.9º C, 2.3º C, 3.7º C and 3.9º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-25 (20160308) (240-61960-1), AMW-24 (20160308) (240-61960-2), AMW-23B (20160308) (240-61960-3), AMW-23 (20160308) (240-61960-4), AMW-20 (20160308) (240-61960-5), TRIPBLANK-01 (20160308) (240-61960-6), AMW-19 (20160309) (240-61960-7), DUP-01 (20160309) (240-61960-8), AMW-22B (20160309) (240-61960-9), AMW-22 (20160309) (240-61960-10) and AMW-07 (20160309) (240-61960-11) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/14/2016 and 03/15/2016.

Methylene Chloride was detected in method blank MB 240-221437/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Sample AMW-25 (20160308) (240-61960-1)[13.33X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: The following sample was submitted for volatile analysis with insufficient preservation (pH>2): AMW-25 (20160308) (240-61960-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-25 (20160308) (240-61960-1), AMW-24 (20160308) (240-61960-2), AMW-23B (20160308) (240-61960-3), AMW-23 (20160308) (240-61960-4), AMW-20 (20160308) (240-61960-5), AMW-19 (20160309) (240-61960-7), DUP-01 (20160309) (240-61960-8), AMW-22B (20160309) (240-61960-9), AMW-22 (20160309) (240-61960-10) and AMW-07 (20160309) (240-61960-11) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/15/2016 and analyzed on 03/17/2016 and 03/18/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

4-Chloroaniline and Caprolactam failed the recovery criteria low for the MS/MSD of sample AMW-22B (20160309)MS/MSD (240-61960-9) in batch 240-221952. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-25 (20160308) (240-61960-1), AMW-24 (20160308) (240-61960-2), AMW-23B (20160308) (240-61960-3), AMW-23 (20160308) (240-61960-4), AMW-20 (20160308) (240-61960-5), AMW-19 (20160309) (240-61960-7), DUP-01 (20160309) (240-61960-8), AMW-22B (20160309) (240-61960-9), AMW-22 (20160309) (240-61960-10) and AMW-07 (20160309) (240-61960-11) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 03/11/2016 and 03/12/2016 and analyzed on 03/15/2016.

Sample AMW-25 (20160308) (240-61960-1)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batches 240-221094 and 240-221293.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-25 (20160308) (240-61960-1), AMW-24 (20160308) (240-61960-2), AMW-23B (20160308) (240-61960-3), AMW-23 (20160308) (240-61960-4), AMW-20 (20160308) (240-61960-5), AMW-19 (20160309) (240-61960-7), AMW-22B (20160309) (240-61960-9), AMW-22 (20160309) (240-61960-10) and AMW-07 (20160309) (240-61960-11) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/11/2016 and analyzed on 03/14/2016.

Iron, Magnesium, Manganese, Nickel and Sodium were detected in method blank MB 240-221145/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-25 (20160308) (240-61960-1), AMW-24 (20160308) (240-61960-2), AMW-23B (20160308) (240-61960-3), AMW-23 (20160308) (240-61960-4), AMW-20 (20160308) (240-61960-5), AMW-19 (20160309) (240-61960-7), AMW-22B (20160309) (240-61960-9), AMW-22 (20160309) (240-61960-10) and AMW-07 (20160309) (240-61960-11) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/11/2016 and analyzed on 03/15/2016.

Mercury failed the recovery criteria low for the MSD of sample AMW-22B (20160309)MSD (240-61960-9) in batch 240-221648. Mercury exceeded the RPD limit. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-61960-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	L	A negative instrument reading had an absolute value greater than the reporting limit
	B	Compound was found in the blank and sample.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 61960-1
Sample date: 2016-03-09 2016-03-08
Report received by CADENA: 2016-03-24
Initial Data Verification completed by CADENA: 2016-03-25

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 221437 method blank had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this method blank detection. (note: trip blank was treated as a QC sample so was not qualified based on this method blank detection)

GCMS VOC trip blank had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this trip blank detection.

GCMS VOC sample -001 container was not preserved to referenced criteria (pH was greater than 2). Sample was analyzed within 7 day holding time for an unpreserved VOC water so qualification was not required based on this sample preservation non-conformance.

GCMS SVOC sample -009 MS/MSD recoveries were outliers biased low for 4-chloroaniline and caprolactam. Client sample -009 results for these analytes should be considered to be estimated and qualified with UJ flags.

WI-DRO QC data did not include surrogate or batch QC MS recoveries.

Metals QC batch 221145 method blank had detections below the RL for magnesium, manganese, iron, nickel and sodium. Client sample -007 iron and samples -001, -002, -003, -004, -005, -007 and -010 nickel results should be considered to be non-detect at the RL and qualified with UB flags.

Metals sample -009 MSD recovery and MS/MSD RPD were outliers with the recovery biased low for mercury. Client sample -009 mercury results should be considered to be estimated and qualified with a UJ flag.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

10 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

ANALYTICAL REPORT

Job Number: 240-62030-1

Job Description: Ford TCAP - E200572

For:
ARCADIS U.S., Inc.
28550 Cabot Drive
Suite 500
Novi, MI 48377

Attention: Kristoffer Hinskey

Approved for release.
Denise Pohl
Project Manager II
3/24/2016 3:46 PM

Denise Pohl, Project Manager II
4101 Shuffel Street NW, North Canton, OH, 44720
(330)966-9789
denise.pohl@testamericainc.com
03/24/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-62030-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/11/2016 10:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.1º C and 1.3º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples AMW-21 (20160309) (240-62030-1), AMW-26 (20160309) (240-62030-2) and TRIP BLANK-01 (240-62030-3) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/14/2016.

Methylene Chloride was detected in method blank MB 240-221437/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method(s) 8260B: The following samples were submitted for volatile analysis with insufficient preservation (pH>2): AMW-21 (20160309) (240-62030-1) and AMW-26 (20160309) (240-62030-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)
Samples AMW-21 (20160309) (240-62030-1) and AMW-26 (20160309) (240-62030-2) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 03/15/2016 and analyzed on 03/17/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

4-Chloroaniline and Caprolactam failed the recovery criteria low for theMS/ MSD of sample 240-61960-9 in batch 240-221952. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO
Samples AMW-21 (20160309) (240-62030-1) and AMW-26 (20160309) (240-62030-2) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 03/12/2016 and analyzed on 03/15/2016.

Method(s) WI-DRO: Significant peaks, readily distinguished from background, were detected in the following sample within five minutes after the end of the analytical window defined by the last component eluting in the WI Diesel Range Organics (C10-C28) mix. : AMW-26 (20160309) (240-62030-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-21 (20160309) (240-62030-1) and AMW-26 (20160309) (240-62030-2) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 03/14/2016 and analyzed on 03/15/2016.

Several analytes were detected in method blank MB 240-221441/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-21 (20160309) (240-62030-1) and AMW-26 (20160309) (240-62030-2) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/14/2016 and analyzed on 03/15/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-62030-1

Lab Section	Qualifier	Description
GC/MS VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 62030-1
Sample date: 2016-03-09
Report received by CADENA: 2016-03-24
Initial Data Verification completed by CADENA: 2016-03-25

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 221437 method blank had a detection below the RL for methylene chloride. Qualification of client sample results was not required based on this method blank detection. (note: trip blank was treated as a QC sample so was not qualified based on this method blank detection)

GCMS VOC trip blank had a detection below the RL for acetone and naphthalene. Client sample -001 and -002 acetone results should be considered to be non-detect at the RL and qualified with UB flags.

GCMS VOC sample -001 and -002 containers were not preserved to referenced criteria (pH was greater than 2). Sample was analyzed within 7 day holding time for an unpreserved VOC water so qualification was not required based on this sample preservation non-conformance.

GCMS SVOC QC batch 221952 MS/MSD recovery outliers were not determined using a sample from this submittal so qualification was not required based on these sample-specific QC outliers.

WI-DRO QC data did not include surrogate or batch QC MS recoveries.

Metals QC batch 221441 method blank had detections below the RL for barium, calciium, magnesium, manganese, iron and sodium. Client sample -001 iron results should be considered to be non-detect at the RL and qualified with UB flags.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC Other and Metals parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

06/14/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-65573-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/3/2016 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.5º C and 1.7º C.

The SVOCs for samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were cancelled per email from client 06/06/2016. The analysis for samples on chain of custody 119190 were cancelled per email from client 06/06/2016. The TAL Metals samples were field filtered per email from client 06/06/2016.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-27(20160601) (240-65573-1), AMW-31(20160601) (240-65573-2) and TRIP BLANK (240-65573-3) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/13/2016.

Bromoform, Bromomethane and Chloroethane failed the recovery criteria high for LCS 240-234191/4. Refer to the QC report for details.

Bromomethane failed the recovery criteria high for the MS/MSD of sample 240-65860-3 in batch 240-234191. Refer to the QC report for details.

Method(s) 8260B: The laboratory control sample (LCS) for 234191 recovered outside control limits for multiple analyte(s). These analytes have been identified as poor performing analytes hen analyzed using this method; therefore, re-extraction/re-analysis was not performed. AMW-27(20160601) (240-65573-1), AMW-31(20160601) (240-65573-2), TRIP BLANK (240-65573-3) and (LCS 240-234191/4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/04/2016 and analyzed on 06/07/2016.

Sample AMW-31(20160601) (240-65573-2)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233151.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO
Samples AMW-27(20160601) (240-65573-1), AMW-31(20160601) (240-65573-2) and TRIP BLANK (240-65573-3) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 06/08/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 06/04/2016 and analyzed on 06/08/2016.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

Samples AMW-27(20160601) (240-65573-1)[2X] and AMW-31(20160601) (240-65573-2)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8082: The following samples were diluted due to the nature of the sample matrix: AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2). Elevated reporting limits (RLs) are provided.

Method(s) 8082: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2). Reagents: 2540200,2103101 and 2283705

Method(s) 8082: The following sample contains an unknown pattern which does not resemble the laboratory known Aroclors. The sample was not quantified as containing an Aroclor. AMW-27(20160601) (240-65573-1)

Method(s) 3520C, 608: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233150.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED RECOVERABLE METALS (ICP)
Samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/06/2016 and analyzed on 06/07/2016.

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2). The continuing calibration blanks and method blanks may not support the lower PQL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY
Samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 06/06/2016 and analyzed on 06/07/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL CYANIDE
Samples AMW-27(20160601) (240-65573-1) and AMW-31(20160601) (240-65573-2) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 06/06/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-65573-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD is outside acceptance limits.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
Metals		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000630.0002
Client project scope reference: Sample COC only was used to define project analytical requirements.
Laboratory: TestAmerica - North Canton
Laboratory submittal: 65573-1
Sample date: 2016-06-01
Report received by CADENA: 2016-06-14
Initial Data Verification completed by CADENA: 2016-06-16

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch 234191 LCS recoveries were outliers biased high for the following analytes: BROMFORM, BROMOMETHANE, CHLOROETHANE. Associated client sample results were non-detect so qualification was not required based on these high bias QC outliers.

GCMS VOC QC batch MS/MSD recovery outliers were not determined using a client sample so qualification was not required based on these sample-specific QC outliers.

WI-DRO, PCB QC batch did not include MS/MSD recovery data due to insufficient sample volume available for spiking according to the laboratory submittal case narrative.

WI-DRO, WI-GRO sample and QC results did not include surrogate recovery data.

GCMS VOC trip blank had a detection below the RL for acetone. Client samples -001, -002 acetone results should be considered to be non-detect at the RL and qualified with UB flags.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) were analyzed for GCMS VOC, PCB, GC VOC, GC Other, Metals and General Chemistry parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-65672-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/4/2016 9:35 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 2.1º C, 2.3º C and 18.7º C.

Receipt Exceptions: The following sample: DUP-02(20160602) was listed on the Chain of Custody (COC); however, no samples were received. Sample AMW-15(20160602) arrived 06/07/2016 above temperature and client to resample. Client requested 06/10/2016 for sample AMW-30(20160602) that the SVOC analysis not be done.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-14(20160602) (240-65672-1), AMW-30(20160602) (240-65672-3) and TRIP BLANK (240-65672-4) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/13/2016.

Bromoform failed the recovery criteria high for LCS 240-234233/4. Refer to the QC report for details.

Sample AMW-14(20160602) (240-65672-1)[500X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 240-234233 recovered outside control limits for the following analyte. Bromoform. Bromoform has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample AMW-14(20160602) (240-65672-1) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/08/2016 and analyzed on 06/13/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Isophorone was detected in method blank MB 240-233595/18-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Sample AMW-14(20160602) (240-65672-1)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8270C: The following sample was diluted due to the nature of the sample matrix: AMW-14(20160602) (240-65672-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/08/2016 and analyzed on 06/15/2016.

Method(s) WI-DRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the WI Diesel Range Organics (C10-C28) mix : AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3).

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233553.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples AMW-14(20160602) (240-65672-1), AMW-30(20160602) (240-65672-3) and TRIP BLANK (240-65672-4) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 06/08/2016 and 06/13/2016.

Sample AMW-14(20160602) (240-65672-1)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 06/08/2016 and analyzed on 06/10/2016 and 06/14/2016.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

Tetrachloro-m-xylene failed the surrogate recovery criteria low for AMW-30(20160602) (240-65672-3). Refer to the QC report for details.

Sample AMW-30(20160602) (240-65672-3)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8082: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3). Reagents: 2564857, 2103099, 2283702.

Method(s) 8082: The following sample was diluted due to the nature of the sample matrix: AMW-30(20160602) (240-65672-3). Elevated reporting limits (RLs) are provided.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233554.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/08/2016 and analyzed on 06/10/2016.

Sodium was detected in method blank MB 240-233638/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3). The continuing calibration blanks and method blanks may not support the lower PQL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 06/08/2016 and analyzed on 06/09/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Mercury was detected in method blank MB 240-233645/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

TOTAL CYANIDE

Samples AMW-14(20160602) (240-65672-1) and AMW-30(20160602) (240-65672-3) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 06/08/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-65672-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD is outside acceptance limits.
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	X	Surrogate is outside control limits
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Trip Blank															

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☒ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☒ Disposal by Lab ☐ Archive for _____ Months

Special Instructions/QC Requirements & Comments:

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.: | Cooler Temp. (°C): Obs'd: _____ Corr'd: _____ Therm ID No.: _____

Client Arcadis Site Name St. Paul

Cooler Received on 6-4-16 Opened on 6-4-16

Cooler unpacked by: Ryan Henderson

FedEx: 1st Grd (Exp) UPS FAS Stetson Client Drop Off TestAmerica Courier Other

Receipt After-hours: Drop-off Date/Time Storage Location

TestAmerica Cooler # NOT Foam Box Client Cooler Box Other multiple

Packing material used: Bubble Wrap Foam Plastic Bag None Other

COOLANT: (Wet Ice) Blue Ice Dry Ice Water None

1. Cooler temperature upon receipt — See Multiple Cooler Form
   IR GUN# 48 (CF -1.9 °C) Observed Cooler Temp. °C Corrected Cooler Temp. °C
   IR GUN# 36 (CF -1.5 °C) Observed Cooler Temp. °C Corrected Cooler Temp. °C
   IR GUN# 18 (CF -0.5 °C) Observed Cooler Temp. °C Corrected Cooler Temp. °C
2. Were custody seals on the outside of the cooler(s)? If Yes Quantity 2 (Yes) No
   -Were custody seals on the outside of the cooler(s) signed & dated? (Yes) No NA
   -Were custody seals on the bottle(s) or bottle kits (LLHg/MeHg)? Yes (No)
3. Shippers' packing slip attached to the cooler(s)? (Yes) No
4. Did custody papers accompany the sample(s)? (Yes) No
5. Were the custody papers relinquished & signed in the appropriate place? (Yes) No
6. Was/were the person(s) who collected the samples clearly identified on the COC? (Yes) No
7. Did all bottles arrive in good condition (Unbroken)? (Yes) No
8. Could all bottle labels be reconciled with the COC? (Yes) No
9. Were correct bottle(s) used for the test(s) indicated? (Yes) No
10. Sufficient quantity received to perform indicated analyses? (Yes) No
11. Are these work share samples? Yes (No)

If yes, Questions 12-16 have been checked at the originating laboratory.

12. Were sample(s) at the correct pH upon receipt? (Yes) No NA pH Strip Lot# HC559158
13. Were VOAs on the COC? (Yes) No
14. Were air bubbles >6 mm in any VOA vials? (Yes) ~~No~~ NA
15. Was a VOA trip blank present in the cooler(s)? Trip Blank Lot # Yes (No)
16. Was a LL Hg or Me Hg trip blank present? Yes No

Contacted PM DSP Date 6/4/16 by HM via Verbal Voice Mail (Other) Email

Concerning #17

17. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES

Samples processed by:

Rec'd 1 cooler w/ ice - No Samples
Received 2 Coolers 6/4/16 w/ AMW-14 & AMW-15, TB.
Missing coolers - Did not receive Samples:
AMW-15 & Dup-02 (all containers) - Still Missing. 6/7/16 AM
Rec'd on 6-7-16 with High temps

18. SAMPLE CONDITION

Sample(s) were received after the recommended holding time had expired.
~~Sample(s) were received in a broken container~~
~~Sample(s) were received with bubble >6 mm in diameter. (Notify PM)~~

19. SAMPLE PRESERVATION

Sample(s) were further preserved in the laboratory.
Time preserved: Preservative(s) added/Lot number(s):

ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000630.00002
Client project scope reference: Sample COC only was used to define project analytical requirements.
Laboratory: TestAmerica - North Canton
Laboratory submittal: 65672-1
Sample date: 2016-06-02 2016-06-01
Report received by CADENA: 2016-06-20
Initial Data Verification completed by CADENA: 2016-06-20

The following minor QC exceptions or missing information were noted:

MBK - METALS QC batch 233638 and 2233645 method blanks had detections below the RL for the following analytes: SODIUM, MERCURY. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: MERCURY - samples -001, -003.

TBK - GCMS VOC TRIP blanks had detections below the RL for the following analytes: ACETONE. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: ACETOEN - sample -003.

GCMS VOC QC batch 234233 LCS recoveries were outliers biased high for the following analytes: BROMOFORM. Associated client sample results were non-detect so qualification was not required based on these high bias QC outliers.

GCMS SVOC QC batch 233595 method blanks had detections below the RL for the following analytes: ISOPHORONE. Qualification of client sample results was not required based on these method blank detections.

WI-DRO and WI-GRO sample and QC results did not include surrogate recovery data. QC batches did not include MS/MSD recovery data.

PCB sample -003 surrogate recovery outliers did not result in qualification of client sample data.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other, Metals and General Chemistry parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

06/17/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-65681-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/7/2016 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.9º C and 1.5º C.

For sample AMW-08(20160603) (240-65681-2), due to limited volume for PCBs/SVOCs, client instructed the lab on 06/07/2016 (phone conversation) to proceed with SVOCs and they would collect additional sample for PCBs.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3), DUP-04(20160603) (240-65681-4) and TRIP BLANK (240-65681-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/09/2016 and 06/13/2016.

Several analytes failed the recovery criteria high for LCS 240-234259/4. Refer to the QC report for details.

Several analytes failed the recovery criteria high for the MS of sample 240-65727-4 in batch 240-234259. Several analytes exceeded the RPD limit for the MSD of sample 240-65727-4 in batch 240-234259. Refer to the QC report for details.

Method(s) 8260B: The pH of the sample(s) was greater than 2. The samples were analyzed within the normal 14 day holding time; however, experimental evidence suggests that some aromatic compounds in wastewater samples, notably, Benzene, Toluene, and Ethylbenzene are susceptible to biological degradation if samples are not preserved to a pH of 2.
AMW-29(20160603) (240-65681-1)

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 240-234259 recovered outside control limits for multiple analytes: These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample AMW-08(20160603) (240-65681-2) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/08/2016 and analyzed on 06/13/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Isophorone was detected in method blank MB 240-233595/18-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/08/2016 and analyzed on 06/15/2016.

Method(s) WI-DRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the WI Diesel Range Organics (C10-C28) mix : AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4).

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233553.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3), DUP-04(20160603) (240-65681-4) and TRIP BLANK (240-65681-5) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 06/08/2016 and 06/13/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples AMW-29(20160603) (240-65681-1), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 06/08/2016 and analyzed on 06/13/2016.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

Samples AMW-29(20160603) (240-65681-1)[20X], AMW-28(20160603) (240-65681-3)[20X] and DUP-04(20160603) (240-65681-4)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8082: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: AMW-29(20160603) (240-65681-1), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4). Reagents: 2564857, 2103099, 2283702

Method(s) 8082: The following samples were diluted due to the nature of the sample matrix: AMW-29(20160603) (240-65681-1), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4). Elevated reporting limits (RLs) are provided.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-233554.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/08/2016 and analyzed on 06/10/2016.

Sodium was detected in method blank MB 240-233638/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4). The continuing calibration blanks and method blanks may not support the lower PQL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 06/08/2016 and analyzed on 06/09/2016.

Mercury was detected in method blank MB 240-233645/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL CYANIDE

Samples AMW-29(20160603) (240-65681-1), AMW-08(20160603) (240-65681-2), AMW-28(20160603) (240-65681-3) and DUP-04(20160603) (240-65681-4) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 06/08/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-65681-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD is outside acceptance limits.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
Metals		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

June 17, 2016

Rob Ellis
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000630.0002
Client project scope reference: Sample COC only was used to define project analytical requirements.
Laboratory: TestAmerica - North Canton
Laboratory submittal: 65681-1
Sample date: 2016-06-03
Report received by CADENA: 2016-06-17
Initial Data Verification completed by CADENA: 2016-06-17

The following minor QC exceptions or missing information were noted:

TBK - GCMS VOC TRIP blanks had detections below the RL for the following analytes: ACETONE. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: ACETONE - sample -002. NOTE: Sample dilution factors are not included when assigning qualification based on trip blank detections.

MBK - METALS QC batch method blanks had detections below the RL for the following analytes: SODIUM, MERCURY. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: MERCURY - samples -002, -003, -004.

GCMS VOC QC batch 234259 LCS recoveries were outliers biased high for the following analytes: 1,1,1,2-TETRACHLOROETHANE, 1,1,1-TRICHLOROETHANE, 2,2-DICHLROPROPANE, BROMOFORM, CARBON TETRACHLORIDE, TETRACHLOROETHYLENE, TRICHLOROFLUOROMETHANE, CHLORODIBROMOMETHANE. Associated client sample results were non-detect so qualification was not required based on these high bias QC outliers.

GCMS VOC QC batch MS/MSD recovery outliers were not determined using a client sample so qualification was not required based on these sample-specific QC outliers.

GCMS SVOC QC batch method blanks had detections below the RL for the following analytes: ISOPHORONE. Qualification of client sample results was not required based on these method blank detections.

WI-DRO QC batch did not include MS/MSD recovery data due to insufficient sample volume available for spiking according to the laboratory submittal case narrative. WI-GRO QC batch did not include MS recovery data.

WI-DRO and WI-GRO sample and QC results did not include surrogate recovery data.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

4 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other, Metals and General Chemistry parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-65910-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/10/2016 9:20 AM and 6/11/2016 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 1.3º C, 1.4º C, 1.9º C, 2.3º C and 2.9º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), TRIP BLANK (240-65972-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/17/2016 and 06/21/2016.

Methylene Chloride was detected in method blank MB 240-234970/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Bromoform failed the recovery criteria high for LCS 240-234970/4. Bromoform, Bromomethane and Trichlorofluoromethane failed the recovery criteria high for LCS 240-235316/4. Refer to the QC report for details.

Methylene Chloride exceeded the RPD limit for the MSD of sample 240-65901-4 in batch 240-234970. 1,2,4-Trimethylbenzene and n-Butylbenzene failed the recovery criteria low for the MSD of sample AMW-25 (20160608)MSD (240-65910-1) in batch 240-234971. 1,2,4-Trimethylbenzene exceeded the RPD limit. 1,1-Dichloropropene, Hexachlorobutadiene, n-Butylbenzene and sec-Butylbenzene failed the recovery criteria low for the MS of sample 240-65968-12 in batch 240-235316. Bromoform failed the recovery criteria high. Several analytes failed the recovery criteria low for the MSD of sample 240-65968-12 in batch 240-235316. Refer to the QC report for details.

Sample AMW-25 (20160608) (240-65910-1)[8X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 240-234970 recovered outside control limits for the following analyte. Bromoform. Bromoform has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 240-235316 recovered outside control limits for multiple analytes. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been

reported.AMW-20 (20160608) (240-65972-1) and (LCS 240-235316/4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/14/2016 and analyzed on 06/15/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Caprolactam failed the recovery criteria low for the MS/MSD of sample 240-65968-12 in batch 240-234545. Refer to the QC report for details.

Sample AMW-25 (20160608) (240-65910-1)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8270C: The following sample was diluted due to the nature of the sample matrix: AMW-25 (20160608) (240-65910-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/13/2016 and 06/14/2016 and analyzed on 06/15/2016 and 06/16/2016.

Sample AMW-25 (20160608) (240-65910-1)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batches 240-234164 and 240-234342.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), TRIP BLANK (240-65972-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 06/15/2016.

WI Gasoline Range Organics (C6-C10) was detected in method blank MB 240-234587/4 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Sample AMW-25 (20160608) (240-65910-1)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/13/2016 and 06/14/2016 and analyzed on 06/15/2016.

Sodium was detected in method blank MB 240-234408/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Calcium failed the recovery criteria low for the MS of sample AMW-25 (20160608)MS (240-65910-1) in batch 240-234547. Refer to the QC report for details.

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-25 (20160608) (240-65910-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6). The continuing calibration blanks and method blanks may not support the lower PQL.

Method(s) 6010B: The CRI associated with batch 240-234547 recovered above the upper control limit for vanadium. The samples associated with this CRI were below the requested reporting limit for the affected analytes; therefore, the data have been reported. The following samples are impacted: AMW-25 (20160608) (240-65910-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608)

(240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6).

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-20 (20160608) (240-65972-1). The continuing calibration blanks and method blanks may not support the lower PQL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 06/13/2016 and 06/14/2016 and analyzed on 06/14/2016 and 06/16/2016.

Method(s) 245.1, 7470A: The laboratory control sample (LCS) for preparation batch 240-234410 and analytical batch 240-234773 recovered outside control limits for the following analytes: Hg. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL CYANIDE

Samples AMW-25 (20160608) (240-65910-1), AMW-20 (20160608) (240-65972-1), AMW-24 (20160608) (240-65910-2), AMW-23 (20160608) (240-65910-3), AMW-23B (20160608) (240-65910-4) and DUP-01 (20160608) (240-65910-6) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 06/15/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-65910-1

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD is outside acceptance limits.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	F2	MS/MSD RPD exceeds control limits
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	*	LCS or LCSD is outside acceptance limits.
	4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Kris Hinskey
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000630.0002
Client project scope reference: Sample COC only was used to define project analytical requirements.
Laboratory: TestAmerica - North Canton
Laboratory submittal: 65910-1
Sample date: 2016-06-08
Report received by CADENA: 2016-06-27
Initial Data Verification completed by CADENA: 2016-06-29

The following minor QC exceptions or missing information were noted:

MBK - WI-GRO QC batch 234587 method blanks had detections below the RL. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: WI-GRO - sample -002.

MSD - GCMS VOC sample -001 MS and MSD recovery outliers or one recovery along with the MS/MSD RPD were outliers with the recovery biased low for the following analytes: 1,2,4-TRIMETHYLEBENZENE. Client sample results for these analytes should be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

GCMS VOC QC batch 234970 method blanks had detections below the RL for the following analytes: METHYLENE CHLORIDE. Qualification of client sample results was not required based on these method blank detections.

METALS QC batch 234408 method blanks had detections below the RL for the following analytes: SODIUM. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC and WI-GRO TRIP blanks had detections below the RL for the following analytes: WI-GRO. Qualification of client sample results was not required based on these TRIP blank detections. NOTE: Sample dilution factors are not included when assigning qualification based on trip blank detections.

METALS QC batch 234410 and GCMS VOC QC batch 234970/235316 LCS recoveries were outliers biased high for the following analytes: MERCURY, BROMFORM, BROMOMETHANE, TRICHLOROFLUOROMETHANE. Associated client sample results were non-detect so qualification was not required based on these high bias QC outliers.

METALS sample -001 MS and or MSD recovery outliers were not used to qualify results for CALCIUM due to high levels of these target analytes in the original sample relative to the spike concentration (4X rule).

GCMS VOC sample -001 and sample -004 MS or MSD recoveries but not both or RPD only were outliers for N-BUTYLBENZENE, METHYLENE CHLORIDE so client sample results were not qualified based on these QC outliers alone.

GCMS SVOC and GCMS VOC QC batch 235316 MS/MSD recovery outliers were not determined using a client sample so qualification was not required based on these sample-specific QC outliers.

WI-DRO QC batch 234164 and 2334342 did not include MS/MSD recovery data due to insufficient sample volume available for spiking according to the laboratory submittal case narrative.

WI-GRO and WI-DRO sample and QC results did not include surrogate recovery data.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other, Metals and General Chemistry parameter(s). 1Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

06/27/2016

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-65968-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/11/2016 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 13 coolers at receipt time were 1.3º C, 1.4º C, 1.6º C, 2.4º C, 2.4º C, 2.6º C, 2.8º C, 3.0º C, 3.1º C, 3.1º C, 3.3º C, 3.6º C and 4.8º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), TRIP BLANK (240-65968-11), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/21/2016.

Bromoform, Bromomethane and Trichlorofluoromethane failed the recovery criteria high for LCS 240-235316/4. Refer to the QC report for details.

1,1-Dichloropropene, Hexachlorobutadiene, n-Butylbenzene and sec-Butylbenzene failed the recovery criteria low for the MS of sample AMW-07 (20160610)MS (240-65968-12) in batch 240-235316. Bromoform failed the recovery criteria high. Several analytes failed the recovery criteria low for the MSD of sample AMW-07 (20160610)MSD (240-65968-12) in batch 240-235316. Refer to the QC report for details.

Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 240-235316 recovered outside control limits for multiple analytes. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), TRIP BLANK (240-65968-11), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13), AMW-21 (20160610) (240-65968-14) and (LCS 240-235316/4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/14/2016 and analyzed on 06/15/2016.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Caprolactam failed the recovery criteria low for the MS/MSD of sample AMW-07 (20160610)MS/MSD (240-65968-12) in batch 240-234545. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/14/2016 and analyzed on 06/16/2016.

Method(s) WI-DRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the WI Diesel Range Organics (C10-C28) mix: AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), TRIP BLANK (240-65968-11), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were analyzed on 06/15/2016 and 06/16/2016.

WI Gasoline Range Organics (C6-C10) was detected in method blank MB 240-234587/4 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-234342.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples AMW-05B (20160609) (240-65968-6) and DUP-03 (20160609) (240-65968-10) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 06/14/2016 and 06/17/2016 and analyzed on 06/16/2016 and 06/21/2016.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

DCB Decachlorobiphenyl failed the surrogate recovery criteria low for AMW-05B (20160609) (240-65968-6). Tetrachloro-m-xylene failed the surrogate recovery criteria low for MB 240-234344/8-A. Refer to the QC report for details.

Method(s) 8082: The following samples required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: AMW-05B (20160609) (240-65968-6) and DUP-03 (20160609) (240-65968-10). Reagents: 2540199, 2564856, 2103098, 2586316, 2103100 and 2283703.

Method(s) 8082: The continuing calibration verification (CCV) associated with batch 235257 recovered above the upper control limit for 1221 and 1254. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8082: TCMX failed low in the method blank of the original run for the following samples: AMW-05B (20160609) (240-65968-6) and DUP-03 (20160609) (240-65968-10). The samples were re-extracted out of hold time. The QC of the re-extract batch passed. But, samples 2 and 6 DCB failed below 10%. The samples are consumed, no re-extract could be performed. Both sets of data has been reported:

Method(s) 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batches 240-234344 and 240-234897.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED METALS (ICP)

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846

Method 6010B. The samples were prepared on 06/14/2016 and analyzed on 06/15/2016.

Sodium was detected in method blank MB 240-234408/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method(s) 200.7 Rev 4.4, 6010B: Some requested practical quantitation limits (PQLs) on the following samples fall below the laboratory's verified standard quantitation limit: AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14). The continuing calibration blanks and method blanks may not support the lower PQL.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED MERCURY (CVAA)

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 06/14/2016 and analyzed on 06/16/2016.

Mercury failed the recovery criteria high for LCS 240-234410/2-A. Refer to the QC report for details.

Method(s) 245.1, 7470A: The laboratory control sample (LCS) for preparation batch 240-234410 and analytical batch 240-234773 recovered outside control limits for the following analytes: Hg. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL CYANIDE

Samples AMW-05B (20160609) (240-65968-6), AMW-22 (20160609) (240-65968-7), AMW-22B (20160609) (240-65968-8), AMW-19 (20160609) (240-65968-9), DUP-03 (20160609) (240-65968-10), AMW-07 (20160610) (240-65968-12), AMW-26 (20160610) (240-65968-13) and AMW-21 (20160610) (240-65968-14) were analyzed for total cyanide in accordance with EPA SW-846 Method 9012A. The samples were prepared and analyzed on 06/15/2016 and 06/17/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

METHOD SUMMARY

Client: ARCADIS U.S., Inc. Job Number: 240-65968-2

Description	Lab Location	Method	Preparation Method
Matrix: Water			
Volatile Organic Compounds (GC/MS)	TAL CAN	SW846 8260B	
Purge and Trap	TAL CAN		SW846 5030B
Semivolatile Organic Compounds (GC/MS)	TAL CAN	SW846 8270C	
Liquid-Liquid Extraction (Separatory Funnel)	TAL CAN		SW846 3510C
Wisconsin - Gasoline Range Organics (GC)	TAL CAN	WI-GRO WI-GRO	
Purge and Trap	TAL CAN		SW846 5030B
Polychlorinated Biphenyls (PCBs) by Gas Chromatography	TAL CAN	SW846 8082	
Liquid-Liquid Extraction (Continuous)	TAL CAN		SW846 3520C
Wisconsin - Diesel Range Organics (GC)	TAL CAN	WI-DRO WI-DRO	
Liquid-Liquid Extraction (Continuous)	TAL CAN		SW846 3520C
Metals (ICP)	TAL CAN	SW846 6010B	
Preparation, Total Recoverable or Dissolved Metals	TAL CAN		SW846 3005A
Sample Filtration, Field			FIELD_FLTRD
Mercury (CVAA)	TAL CAN	SW846 7470A	
Preparation, Mercury	TAL CAN		SW846 7470A
Sample Filtration, Field			FIELD_FLTRD
Cyanide, Total and/or Amenable	TAL CAN	SW846 9012A	
Cyanide, Total and/or Amenable, Distillation	TAL CAN		SW846 9012A

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-65968-2

Lab Section	Qualifier	Description
GC/MS VOA		
	*	LCS or LCSD is outside acceptance limits.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time
	X	Surrogate is outside control limits
Metals		
	B	Compound was found in the blank and sample.
	*	LCS or LCSD is outside acceptance limits.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

QUALITY CONTROL RESULTS

   IR GUN #36 (CF +1.0°C) Observed Cooler Temp._____°C Corrected Cooler Temp._____°C
2. Were custody seals on the outside of the cooler(s)? If Yes Quantity_____ Yes (No)
   -Were custody seals on the outside of the cooler(s) signed & dated? Yes No (NA)
   -Were custody seals on the bottle(s) or bottle kits (LLHg/MeHg)? Yes (No)
3. Shippers' packing slip attached to the cooler(s)? (Yes) No
4. Did custody papers accompany the sample(s)? (Yes) No
5. Were the custody papers relinquished & signed in the appropriate place? (Yes) No
6. Was/were the person(s) who collected the samples clearly identified on the COC? (Yes) No
7. Did all bottles arrive in good condition (Unbroken)? (Yes) No
8. Could all bottle labels be reconciled with the COC? Yes (No)
9. Were correct bottle(s) used for the test(s) indicated? (Yes) No
10. Sufficient quantity received to perform indicated analyses? (Yes) No
11. Are these work share samples? Yes (No)

If yes, Questions 11-15 have been checked at the originating laboratory.

11. Were sample(s) at the correct pH upon receipt? (Yes) No NA pH Strip Lot# **HC559158**
12. Were VOAs on the COC? (Yes) No
13. Were air bubbles >6 mm in any VOA vials? Yes (No) NA
14. Was a VOA trip blank present in the cooler(s)? Trip Blank Lot #B528304US (Yes) No
15. Was a LL Hg or Me Hg trip blank present? _____ Yes (No)

Contacted PM _____ Date _____ by _____ via Verbal Voice Mail Other

Kris Hinskey
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000630.0002
Client project scope reference: Sample COC only was used to define project analytical requirements.
Laboratory: TestAmerica - North Canton
Laboratory submittal: 65968-2
Sample date: 2016-06-09 2016-06-10
Report received by CADENA: 2016-06-27
Initial Data Verification completed by CADENA: 2016-06-29

The following minor QC exceptions or missing information were noted:

MSD - GCMS VOC sample -012 MS and MSD recovery outliers or one recovery along with the MS/MSD RPD were outliers with the recovery biased low for the following analytes: 1,1-DICHLOROPROPENE, N-BUTYLBENZENE, SEC-BUTYLBENZENE. Client sample results for these analytes should be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

MSD - GCMS SVOC sample -012 MS and MSD recovery outliers or one recovery along with the MS/MSD RPD were outliers with the recovery biased low for the following analytes: CAPROLACTAM. Client sample results for these analytes should be considered to be estimated and qualified with a J flag if detected and UJ flags if non-detect.

MBK - WI-GRO QC batch 234587 method blanks had detections below the RL. The following client sample results should be considered to be non-detect at the RL and qualified with UB flags: WI-GRO - samples -006, -007, -008, -009, -013.

SUR - PCB surrogates recovered less than 10% or did not recover in samples -006RE-ANALYSIS, METHOD BLANK for QC BATCH 234344. Associated client sample non-detect results are considered to be unusable and have been qualified with R flags. Detected analyte results are considered to be estimated and qualified with J flags. Original run results for client sample -006 were considered to be the usable data in place of these unusable results.

METALS QC batch 234410 and GCMS VOC QC batch 235316 LCS recoveries were outliers biased high for the following analytes: MERCURY, BROMOMETHANE, BROMOFORM, TRICHLOROFLUOROMETHANE. Associated client sample results were non-detect so qualification was not required based on these high bias QC outliers.

WI-GRO and WI-DRO sample and QC results did not include surrogate recovery data.

PCB QC batch 234344 and 234897 and WI-GRO QC batch 234342 did not include MS/MSD recovery data due to insufficient sample volume available for spiking according to the laboratory submittal case narrative.

HTQ - PCB sample -006RE-ANALYSIS and -010RE-ANALYSIS were analyzed outside of referenced holding time so all associated results should be considered to be estimated and qualified with J flags if detected and UJ flags if non-detect. NOTE: Sample -006 re-analysis also had surrogate recoveries below 10% so these results were considered to be unusable.

GCMS VOC sample -012 MS or MSD recoveries but not both or RPD only were outliers for 2-CHLOROTOLUENE, 4-CHLOROTOLUENE, BROMOFORM, HEXACHLOROBUTADIENE so client sample results were not qualified based on these QC outliers alone.

PCB QC batch CCV response outliers as noted in the laboratory submittal case narrative were not used to qualify client sample results as part of this level 2 data package verification review.

METALS QC batch 234408 method blanks had detections below the RL for the following analytes: SODIUM. Qualification of client sample results was not required based on these method blank detections.

GCMS VOC/WI-GRO TRIP blanks had detections below the RL for the following analytes: WI-GRO. Qualification of client sample results was not required based on these TRIP blank detections. NOTE: Sample dilution factors are not included when assigning qualification based on trip blank detections.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

8 Water sample(s) were analyzed for GCMS VOC, GCMS SVOC, PCB, GC VOC, GC Other, Metals and General Chemistry parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

RE: Project: DE000372.0003 FORD TCAP
Pace Project No.: 40128259

Dear Jim Ziska:
Enclosed are the analytical results for sample(s) received by the laboratory on February 13, 2016. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Christopher Hyska for
Laurie Woelfel

QUALIFIERS

Project: DE000372.0003 FORD TCAP
Pace Project No.: 40128259

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-G	Pace Analytical Services - Green Bay

BATCH QUALIFIERS

Batch: GCSV/14061

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

1q	Surrogate DCB could not be accurately quantified due to matrix interferences.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
P6	Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.
S0	Surrogate recovery outside laboratory control limits.
T4	Result reported for hydrocarbons within the method-specific range that do not match pattern of laboratory standard.

Project Manager Review: LW **Date:** 2/15/16

February 17, 2016

Rob Ellis
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: PACE Laboratories Inc. - Green Bay
Laboratory submittal: 40128259
Sample date: 2016-02-11 2016-02-12
Report received by CADENA: 2016-02-17
Initial Data Verification completed by CADENA: 2016-02-17

The following significant QC anomalies were identified during verification of the analytical report:

PCB surrogate recoveries were outliers biased low and less than 10% for 1 out of 2 surrogates in client samples -001, -003, -005 and -007. PCB results for these samples should be considered to be unusable and qualified with R flags if non-detect and estimated and J flags if detected.

The following minor QC exceptions or missing information were noted:

Metals sample -001 MS/MSD recoveries were outliers biased high for aluminum. Client sample aluminum results should be considered to be estimated and qualified with a J flag. MS/MSD recoveries for calcium and sodium were no considered to be statistically reliable so were not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule).

WI-DRO samples and batch QC did not include surrogate or MS/MSD recovery data.

PCB and GCMS VOC QC batches did not include MS recovery data.

GCMS VOC trip blank was non-detect for all target analytes.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

6 Water sample(s) were analyzed for GCMS VOC, PCB, GC Other, Metals and General Chemistry parameter(s). 1 Trip blank was analyzed for GCMS VOC parameters.

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A0K080453

The following report contains the analytical results for five water samples and one quality control sample submitted to TestAmerica North Canton by ARCADIS U.S., Inc. from the FORD E200572 Site, project number MN000613.0003. The samples were received November 06, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperatures of the coolers upon sample receipt were1.5 and 2.8°C.

See TestAmerica's Cooler Receipt Form for additional information.

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

GC/MS SEMIVOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 0314042. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

GASOLINE RANGE ORGANICS

The analytical results met the requirements of the laboratory's QA/QC program.

DIESEL RANGE ORGANICS

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

CASE NARRATIVE (continued)

DIESEL RANGE ORGANICS (continued)

There were no client requested Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples in batch(es) 0314041. Therefore, the laboratory has included a Laboratory Control Sample Duplicate (LCSD) in the QC batch. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

14. CHAIN OF CUSTODY

The following discrepancies occurred:
COC = no tests rec'd for SW-02, 03, 04 + Outfall-01
rec'd SVOC, DRO + Metals + hardness nan bottle for 02 - will log.
rec'd VOC GRO vials for 03 - will log + DRO, SVOC + Met. + hardness will log.
rec'd VOC, SVOC, GRO, DRO, Metals + Hardness for 04 - will log
rec'd VOC, GRO, Met., hardness + SVOC bottle for outfall-01 - will log.

15. SAMPLE CONDITION

Sample(s) were received after the recommended holding time had expired.
Sample(s) Outfall-01/11-4-10/12:30 (1xL) DRO were received in a broken container.
Sample(s) were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) were further preserved in Sample Receiving to meet recommended pH level(s). *Nitric Acid Lot#* 051010-HNO_3; *Sulfuric Acid Lot#* 051010-H_2SO_4; *Sodium Hydroxide Lot#* 100108 -*NaOH; Hydrochloric Acid Lot#* 092006-*HCl; Sodium Hydroxide and Zinc Acetate Lot#* 100108-$(CH_3COO)_2ZN/NaOH$. What time was preservative added to sample(s)?

END OF REPORT

December 01, 2010

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000613.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: A0K080453
Sample date: 2010-11-04
Report received by Enovis: 2010-11-29
Initial Data Verification completed by Enovis: 2010-12-01

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

5 Water sample(s) and 1 water trip blank were analyzed for GCMS VOC, GCMS SVOC, GRO, DRO, Metals and General Chemistry parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC QC batch MS/MSD recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

GCMS VOC trip blank had a detection below the RL for Acetone and MEK. Client samples -001, -004 and -005 Acetone results should all be considered to be non-detect at the RL and qualified with UB flags. The MEK detection did not require qualification for client sample results.

GCMS SVOC LCS and LCSduplicate recoveries were outside of laboratory control limits biased low for Hexachlorocyclopentadiene. Client samples -001, -002, -003, -004 and -005 results for this analyte should be considered to be estimated and qualified with UJ flags.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia, Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

CASE NARRATIVE

A0K110533

The following report contains the analytical results for two water samples and one quality control sample submitted to TestAmerica North Canton by ARCADIS U.S., Inc. from the FORD TCAP MN E200572 Site, project number E200572. The samples were received November 11, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 1.3°C.

CASE NARRATIVE (continued)

GC/MS VOLATILES

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 0330020 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

GASOLINE RANGE ORGANICS

The matrix spike/matrix spike duplicate(s) for batch(es) 0321051 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

EXECUTIVE SUMMARY - Detection Highlights

A0K110533

PARAMETER	RESULT	REPORTING LIMIT	UNITS	ANALYTICAL METHOD

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

THE LEADER IN ENVIRONMENTAL TESTING

END OF REPORT

December 01, 2010

Rebecca Forbort
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

Enovis project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: MN000591.0001.0001
Laboratory: TestAmerica - North Canton
Laboratory submittal: A0K110533
Sample date: 2010-11-10
Report received by Enovis: 2010-11-30
Initial Data Verification completed by Enovis: 2010-12-01

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the Enovis Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

2 Water sample(s) and 1 water trip blank were analyzed for GCMS VOC and GRO parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, LCS/LCD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the Enovis CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The following minor QC exceptions or missing information were noted:

GCMS VOC trip blank had detections below the RL for Acetone and MEK. Client samples -001 and -002 results for Acetone should be considered to be non-detect at the RL and qualified with UB flags. The MEK detection did not require qualifications for client sample results.

GCMS VOC method blank had a detection below the RL for Tetrahydrofuran. Qualification of client sample results is not required based on this method blank detection.

GCMS VOC LCS recoveries were outside of laboratory control limits biased high for Acetone. The LCS duplicate and LCS/LCSduplicate RPD were acceptable so qualification of client sample results was not required based on this QC outlier alone.

GCMS VOC and GRO MS/MSD recovery outliers were not performed on a sample from this submittal. Qualification of client sample results is not required based on these sample-matrix specific QC outliers.

The definitions of the qualifiers used for this data package are defined in the analytical report. Enovis valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory's analytical report access the Enovis CLMS at http://enovis-inc.com/enovis53/index.cfm.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia, Project Scientist

Enovis Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

1. Introduction

ARCADIS has prepared this Field Sampling Plan (FSP) for the investigation to be conducted at the Twin Cities Assembly Plant (TCAP). The investigation will be performed in accordance with the scope of work contained in the work plan(s) prepared by ARCADIS for the Site (ARCADIS, 2007).

The FSP provides the framework for the sampling methodology and data collection activities to be conducted at TCAP. Included in the FSP are Standard Operating Protocols & Procedures (SOPs) which detail the elements of the various anticipated field tasks: reconnaissance survey, drilling and installation of monitoring wells; field measurements; sample collection; and chain-of-custody procedures. The FSP incorporates accepted and standard methodology for federal and State of Minnesota, Minnesota Pollution Control Agency (MPCA) environmental programs. The format and contents of the FSP have been prepared in accordance with the following U.S. Environmental Protection Agency (USEPA) guidance documents:

- USEPA. October 1988. Guidance for Conducting Remedial Investigation and Feasibility Studies Under CERCLA. Interim Final. EPA/540/G-89/004.
- USEPA. December 1987. Compendium of Superfund Field Operations Methods. EPA/P-87/001.
- USEPA. May 1978, revised May 1986. NEIC Policies and Procedures. EPA-330/9-78-001-R.

The SOPs were also prepared in accordance with the following State of Minnesota regulations and guidance:

- MPCA Voluntary Investigation and Cleanup (VIC) Program
- MPCA Petroleum Remediation Program (PRP)
- Minnesota Department of Health (MDH) Requirements

The investigation work plan presents the known site history and scope of work.. This FSP serves as a supplement to the work plan, providing detailed SOPs for the execution of the activities described in the work plan. Information which is incorporated

in the work plan is not repeated herein. This FSP will be provided to and followed by the field team.

2. Sample Locations and Frequency

The environmental media which will or may be sampled during the course of investigative activities at the site include:

- Groundwater
- Surface water
- Subsurface soils
- Surface soils
- Waste Materials
- Geophysical Logging

The anticipated locations and number of these samples are specified in the investigation work plan. Groundwater samples will be collected from the designated monitoring well locations. Soil samples will be collected from the designated hand auger, surface soil location, or soil borings. Surface water samples will be collected from designated sampling locations.

Selected samples of environmental media will be collected and placed into sample containers in accordance with the SOPs presented in this FSP. In addition to the soil samples collected for laboratory analyses, samples will also be collected for geologic characterization.

3. Location and Sample Nomenclature

Location: A sample designation system will be used to identify samples for laboratory analyses. A list of identifiers used for each sample will be maintained in the project logbook by the ARCADIS Field Team Leader.

Each location will have a unique sample location name. Since soil borings and monitoring wells have previously been completed at the site, investigative locations

completed by ARCADIS will start with A, followed by a one to two letter designation to describe the type of sample. A two digit sequential number will then follow to provide a unique identifier for each sample location. Given the potential for more soil borings a three digit sequential number will be used for soil borings. The following are the sample prefix designations that will be employed at TCAP to identify sample locations.

ASB – Soil Boring

AMW- Monitoring Well

HA – Hand Auger Boring

ASD – Sediment Location

AGM-SS – Surface Soil Location

AWS – Wipe Sample Location

ST – Sheen Test

Samples: Each sample that is collected will be designated by a unique sample identification number. The first part of the identifier will correspond to the location and the second part of the sample by the sample depth (if applicable) and the sample date. For example, a soil sample collected from ASB-001 from 4-6' on June 1, 2007 would be labeled: ASB-001_4-6' (20070601). A water sample collected from this location would be referenced by ASB-001 (20070601). The screened interval of the temporary well should be noted in the field book. Repetitive sampling points, such as samples collected from groundwater monitoring wells or piezometers, will be suffixed by the date collected.

Equipment blanks and trip blanks will be unique and identified by their associated prefix numbered sequentially (to differentiate between multiple samples collected on the same date), and suffixed by the date. The ARCADIS sampler will indicate in the logbook the sampling equipment corresponding to each equipment blank.

EB - Equipment Blank Ex. EB (20070601)

TB – Trip Blank Ex. TB (20070601)

In the event that one or more EB or TB samples are collected on the same date, a number will be suffixed after the sample name. Ex. EB-01 (20070601)

Field duplicates will be identified with a unique sample identification number; such that the laboratory will not be aware that the sample is a duplicate (duplicates will be numbered sequentially). The ARCADIS Field Team Leader will note in the logbook where the duplicate samples were collected so this information will be available when the laboratory data is reviewed

DUP – Duplicate Sample Ex. DUP-001

Unlike the other quality assurance samples, MS/MSD samples are not separate samples; therefore, they are not assigned unique sample numbers. The only difference between a MS/MSD sample and a standard sample is that additional sample volume is collected at the location that the MS/MSD sample is obtained. These samples will be identified by adding a "MS" and "MSD" to the identifier of the sample where the MS/MSD sample is collected.

4. Field Quality Assurance Program

The Quality Assurance/Quality Control (QA/QC) protocols for the work described in this Work Plan will meet or exceed the standards of care required by the State of Minnesota and by Ford. Field QC samples to be collected during the sampling program include the following:

- Trip blanks
- Matrix spike/matrix spike duplicates
- Duplicates.
- Equipment blanks.

Trip blanks consist of an aliquot of distilled water that is sealed in a sample bottle by the analytical laboratory prior to shipping sample bottles to the Site. The trip blank is used to determine if any cross-contamination occurs between aqueous samples during shipment. Trip blanks are analyzed for VOCs only. Trip blanks will be prepared in glass vials (40 milliliter) with Teflon-lined lids by the analytical laboratory and shipped to the sampling team. Upon arrival at Site, the sealed trip blank bottles will be placed in a

cooler and will be brought to the field by the sampling team. A trip blank will be shipped to the analytical laboratory each day of field sampling for aqueous volatiles. If multiple coolers are required to store and transport aqueous VOC samples, a trip blank will be placed in each cooler.

Matrix Spike/Matrix Spike Duplicates (MS/MSD) for organic analysis are performed at a predetermined frequency. If an MS/MSD is requested by the field personnel, triple sample volume must be collected and submitted to the analytical laboratory to ensure the laboratory has sufficient volume for MS/MSD analysis. One MS/MSD will be collected/analyzed for every 20 samples (i.e., 5 percent) in a sample delivery group.

Duplicates (Blind Duplicates) will be collected/analyzed at a frequency of one per every 20 samples (i.e., 5 percent) water samples collected.

Equipment blank samples are sometimes collected to verify that the effectiveness of the decontamination process for non-dedicated or reusable sampling equipment. Equipment rinsates are collected from the final rinse water generated using a laboratory-grade water source.

5. Field Logbooks/Documentation

The field logbook(s) will provide the means of recording data from collection activities performed. As such, entries will be described in as much detail as possible so that a particular situation can be reconstructed without reliance on memory.

Field logbooks will be field survey books or notebooks. Field logbooks will be assigned to field personnel, but will be stored in the document control center when not in use.

- The title page of each field logbook will contain the following:
- Project name.
- Project start date.
- End date.

Entries into the logbook will contain a variety of information including the date, start time, weather, names of all sampling team members present, level of personal protection being used if other than level D, and the signature of the person making the

entry. The names of visitors to the Site, field sampling or investigation team personnel, and the purpose of their visit will also be recorded in the field logbook.

Measurements made and samples collected will be recorded in the field logbook. All entries will be made in indelible ink and no erasures will be made. If an incorrect entry is made, the information will be crossed out with a single strike mark. Whenever a sample is collected, or a measurement is made, a detailed description of the location of the station, which may include compass and distance measurements (if necessary or not obvious), shall be recorded. The number of the photographs taken of the station, if any, will also be noted.

The equipment used to collect samples will be noted, along with the time of sampling, sample description, depth at which the sample was collected, and volume and number of containers. Field duplicate samples, which will receive separate sample identification numbers, will be noted in the field logbook.

6. Data Collection Protocols and Procedures

The equipment, protocols and procedures for the data collection activities are described in detail in the appended SOPs. Equipment decontamination procedures are also included in the SOPs.

The following SOPs are included as appendices to the FSP:

FSP Appendix	Title
A	Rotasonic Soil Sampling Procedures, Decontamination, Monitoring Well Installation
B	Hollow Stem Auger Drilling, Subsurface Soil Sampling Protocol and Temporary Monitoring Well Installation/Sampling
C	Hand Auger Sampling Procedures
D	Groundwater Sampling Protocol
E	Surface-Water Sampling Protocol

FSP Appendix	Title
F	Surface Soil and Waste Material Sampling Protocol
G	Geophysical Logging
H	Field Instrumentation Operating Procedures
I	Chain-of-Custody Procedures
J	ARCADIS Field Forms / Logs

7. Investigative-Generated Wastes

Drill cuttings and purge water generated during the field investigation will be handled in an appropriate manner that complies with federal, state, and local regulations. Immediately after generation all soil and groundwater investigative derived waste (IDW) will be containerized and properly labeled pending characterization. Soil and rock cuttings that appear not to be impacted (based upon PID readings, visual observation and best professional judgment) will be grouped together for composite sampling. Soil and rock cuttings from locations which appear to have higher impacts will be containerized separately from the composite group and placed in a separate 55-gallon drum for waste characterization and disposal. The waste will be sampled as specified in the work plan and may include Toxicity Characteristic Leaching Procedure (TCLP) VOCs, TCLP SVOCs and TCLP Metals, total PCBs, total sulfide and cyanide, corrosivity, flashpoint, pH, TCLP herbicides and pesticides as needed.

Purge water generated during the monitoring well development and groundwater sampling of the monitoring wells and temporary wells will be containerized and labeled. The groundwater analytical results from the wells should be sufficient to characterize the purge water for disposal. Based on the analytical results the purge water will be disposed of via the sanitary sewer, at the on-site waste water treatment plant, if the existing permit allows or by a disposal facility. Refer to the work plan for sampling parameters if additional waste characterization is needed.

ARCADIS

Appendix A

Rotasonic Soil Sampling
Procedures, Decontamination,
Monitoring Well Installation

1. Rotasonic Drilling

Rotasonic drilling is the preferred drilling method for completing boreholes for monitoring wells at TCAP due to the presence of bedrock at a shallow depth and the ability of the method to provide continuous core samples with nearly undisturbed accuracy. An ARCADIS field inspector will be present at the operating drill rig and will be responsible for the collection and logging of soil and rock samples, monitoring of drilling decontamination operations, recording of groundwater data, deciding on final drilling depths and screen intervals (in consultation with the project manager), preparing the boring logs and well completion diagrams, and recording the well installation procedures. Additionally, the field inspector will maintain a log recording daily events, including arrivals and departures at the site by any and all personnel and equipment, and times of work start-up and stoppage. The forms to be used by the field inspector as part of the Quality Assurance/Quality Control (QA/QC) measures of the project are included in Appendix J.

Drilling with the Rotasonic method is accomplished by imparting high-frequency vibrations from a sonic drill head to a dual string of drill pipe. A rotational drive in the drill head also rotates the drill pipe to assist the vibratory drill action. The vibratory action of the drill pipe transfers energy to the drill bit so that subsurface materials are either:

1. Fluidized and forced into the inner sampling pipe or pushed aside (such as in unconsolidated material),

2. Sheared and captured by the sampling pipe (such as in clays and shales), or

3. Fractured and retained in the sampling pipe (such as in consolidated rock).

Rotasonic drilling usually requires no drilling fluid in unconsolidated sediments. Water or air is required as a drilling fluid to transport cuttings when drilling through boulders or consolidated rock, and water may be added to lubricate the annular space between the outer drill pipe and the inner sampling pipe to shorten drilling time when drilling in unconsolidated sediment.

If any problems are encountered or questions arise during the field investigation that are beyond the scope of expertise/responsibility of the field inspector, she/he will temporarily halt all field activities in order to confer with the project manager. In this way, a technically sound decision will be made by several experienced individuals.

2. Formation Sampling

Soil samples will be collected continuously to the total depth of the borehole at each designated Rotasonic location. The dual-pipe drill string consists of a 4-inch internal-diameter pipe and sampling tube inside of a 6-inch internal-diameter drive casing. The drive casing is advanced to ensure that the borehole remains open upon extraction of the sampling pipe. Drilling will proceed by:

1. Vibrating the inner sampling string into place,
2. Advancing the 6-inch outer casing over the sampling string to the same depth,
3. Retrieving the inner pipe string and sample barrel with the sample inside while the outer casing remains in place,
4. Retrieving the cored sample from the sampling tube,
5. Adding another length of pipe to the sampling string, and
6. Advancing the sampling string to a depth 5 or 10 ft beyond the end of the outer casing. This process will be repeated until the target depth of the soil boring is reached.

Pushing the soils out of the sample barrel, a clean four-inch plastic bag will be used to collect samples continuously to the depth specified in the work plan. New plastic is used for each sample collection.

The collected soil samples will be described, cataloged and retained by the on-site field inspector. It is the responsibility of the field inspector to ensure that between sample collections, the sampling device is cleaned according to the protocol outlined in Section 6 of this Appendix. In this way, if contamination is encountered at one elevation in the borehole, it will not be transferred to lower elevations in the borehole. A detailed soil sampling protocol is as follows:

1. The cleaned sample pipe will be given to the driller (or helper), by the ARCADIS field inspector who will make sure that the individual is wearing clean, disposable gloves.
2. The sample pipe string will be advanced to the target depth.

3. The ARCADIS field inspector will obtain the sample pipe string from the driller and the sample will be extruded from the pipe and placed into plastic bags.

4. The sample will be screened for volatile organic compound (VOCs) using a photoionization detector (PID).

5. The ARCADIS Sample/Core Log will be filled out as discussed below.

6. The sampling equipment will be cleaned as previously described.

After collection, soil and rock samples will be visually identified by the field inspector using the USCS classification System. The information recorded on the sample/core log by the field inspector will include:

- Soil/rock sample interval
- Amount of sample recovered
- Sample color
- Sample texture
- Sample moisture content
- Organic vapor readings
- Unusual characteristics
- Depth to water
- Drill rig behavior and penetration rate

An example sample/core log is present in Appendix J. Representative soil samples from each sampled interval will be placed in clean glass jars with screw-type lids for future reference. Each sample container will be labeled with the site name and the boring and sample number.

3. Analytical Sampling

3.1 Field Screening

Each soil sample collected will be screened with a PID. The information will then be recorded on the ARCADIS Sample/Core Log. Calibration procedures for the PID are in Appendix H.

3.2 Laboratory Analysis

A subset of soil samples may be containerized and submitted for laboratory analysis. The analytical parameters for each boring location are presented in the work plan. Soil samples will be transferred to clean, laboratory-supplied containers, preserved in accordance with the applicable analytical methodology, labeled, and placed in a cooler with ice.

3.3 Sample Labels and Chain-of-Custody Form

Sample labels are necessary for proper sample identification. The labels will be affixed to the sample containers prior to the time of sampling and will not be affixed to lids or caps. To track QA/QC handling protocols the labels will be filled out by sampling personnel, and the ARCADIS Chain-of-Custody form (see Appendix G) will be completed in the field before the sampling team leaves the site. Labels will include sample identification, project number, date and time collected, and analyses to be performed.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in Appendix G.

4. Monitoring Well Installation and Development

4.1 Monitoring Well Installation

The installation of each monitoring well will begin immediately after borehole completion, or as directed by the Project Manager. Once monitoring well installation has begun, breaks will not be taken until the well has been completed and secured against

unauthorized access. In cases of unscheduled delays, such as personal injury, equipment breakdowns, or sudden inclement weather, installation will be resumed as soon as practical.

4.2 Well Construction

Monitoring wells will be constructed of 2-inch diameter Schedule 40 PVC and stainless steel screen. The well screens will be fabricated and have an inside diameter equal to the well casing. Fittings (couplings) will not restrict the inside well diameter as joints will be internally threaded. Glues, solvents, or chemical cleaners will not be used to join the casing and screen lengths. All screens, casings, and fittings will be new material. The lengths of casing and screen will be measured and recorded by the field inspector prior to installation. All casing and screens will be decontaminated prior to installation.

Monitoring well depths and screen zones will be determined following a review, by all technical project personnel, of all available borehole data, including the field inspector's and driller's sample logs.

Monitoring well screen depths will be calculated by the field inspector by maintaining accurate measurements of screen and casing placed in the borehole. Upon well completion, the field inspector will verify the screen length by sounding the well for total depth and comparing this value to the total measured length of the well materials that were lowered into the borehole.

4.3 Gravel Pack

A gravel pack will be installed in the borehole annulus around the screen. Clean silica sand backfill, suitable for the formation and screen slot size, will be placed around the screen; a weighted steel tape will be placed down the annulus periodically to measure the depth to the gravel pack to be sure it is not bridging and that it is at least 2 feet above the top of the screen.

A representative sample of the gravel pack material will be supplied to ARCADIS by the driller prior to use. The gravel pack material will be described, in writing by ARCADIS, using the following general guidelines: lithology, grain-size distribution, trade name (if any) and source (including company and location), and its suitability for use will be determined in advance of well construction.

4.4 Bentonite Seal

A bentonite seal approximately 2 to 3 feet thick will be placed on the top of the gravel pack using a tremie pipe. The thickness of the seal will be verified by field measurements of the depth to the gravel pack and depth to the top of the seal.

4.5 Bentonite/Cement Grout

A slurry of bentonite (5 percent)/cement (95 percent) will be placed using a tremie pipe in the annulus between the borehole and/or surface casing and the well casing. The bentonite/cement grout will be placed from the top of the bentonite seal to approximately 2 feet below grade.

4.6 Protective Casing

A locking steel protective casing and/or steel flush mount cover will be set over each well head and cemented in place to a minimum depth of 2 feet below land surface. Each protective pipe will be painted to increase visibility.

The top of the well casing will serve as the measuring point for the groundwater level measurements. The well location will be surveyed to the nearest foot and the measuring point will be marked on the well casing and surveyed to the nearest 0.01 foot (relative to mean sea level).

4.7 Monitoring Well Construction Diagram

A well construction diagram will be prepared by the on-site field inspector for each well and will show the following items:

The bottom of the borehole (that part of the borehole most deeply penetrated by drilling and/or sampling).

The screen setting depth.

The gravel pack interval.

The bentonite seal interval.

The grout interval.

The borehole and will casing diameters

The height of the well casing (without cap/plug) above ground surface.

The protective casing.

Each well construction diagram will be included as part of the QA/QC procedures. An example of a well construction diagram is in Appendix J.

4.8 Monitoring Well Development

A record of well development will be maintained along with the other pertinent well data as part of the QA/QC procedures. Well development will be accomplished using an appropriate technique(s), such as pumping with a centrifugal pump, low-flow submersible pump, surging with air, mechanical surging of the well, or any combination of the above. Development will continue until the well responds to water-level changes in the formation, and the well produces clear, sediment-free water to the extent possible. Development water will be collected and disposed of properly.

Dispersing agents, acids, disinfectants, or other additives will not be used during development nor will they be introduced into the well at any other time. During development, water will be removed from the entire column of water standing in the well by periodically lowering and raising the pump intake.

Well development will include the rinsing of the interior well casing above the water column in the well using only water from that well. The well will be covered with a clean well cap which will be rinsed with distilled water prior to installation. The result of this operation will be a well casing free of extraneous materials (grout, bentonite, sand, etc.).

The following data will be recorded as part of development and QA/QC procedures:

The static water-level measured from the top of the well casing before and after development is completed.

The calculated quantity of fluid standing in the well prior to development.

The sounded well depth before and after development to determine if siltation has occurred inside the well.

The physical character (e.g., clarity, color, particulates, and odor) of water removed, including changes during development.

They type and size/capacity of pump used.

The surging techniques used.

The quantity of fluid/water removed and the time of removal (both incremental and total values).

5. Groundwater Sampling

Collection of groundwater samples from the monitoring wells will be conducted in accordance with the procedures in Appendix D.

In addition to groundwater samples from the monitoring wells, groundwater samples may be collected from discrete intervals within the designated soil boring locations. Groundwater samples will be collected using a standard one-inch temporary PVC well. New, clean temporary wells will be constructed for each designated boring. Dedicated tubing will be lowered into the water column, attached to a peristaltic pump, and a groundwater sample will be collected. In an attempt to minimize turbidity, every effort will be made to remove a minimum of one gallon of groundwater before the analytical sample is collected. In low yielding formations (till), this amount may not be achievable. Groundwater samples will be collected in laboratory containers labeled and placed in an ice filled cooler. Samples will be collected according to volatilization sensitivities. Sample shipment and chain-of-custody procedures will be followed according to procedures outlined in Appendix G.

6. Decontamination

The drilling casings, rods, samplers, tools, water tanks, drilling rig, and any piece of equipment that can come into contact (directly or indirectly) with the formation or well will be decontaminated on-site prior to set up for drilling. Decontamination protocols will also be followed between boreholes (at a fixed on-site location) and before leaving the site at the end of the project. The on-site decontamination activities will be monitored by the ARCADIS field inspector.

Equipment used to sample unconsolidated sediments (e.g. sample barrel, stainless-steel spatulas) will be decontaminated prior to each sample collection. Disposable

gloves will be worn while equipment is cleaned to avoid contamination and the gloves will be changed frequently. The procedure for cleaning this equipment is as follows:

1. Prepare a 2-percent solution of laboratory grade detergent and distilled water in a bucket.

2. Disassemble the split-spoon sampler and immerse the parts and spatula in the laboratory grade detergent solution.

3. Scrub equipment in the bucket with a brush to remove any adhering particles.

4. Rinse the equipment with copious amounts of distilled water.

5. Place clean equipment on a clean polyethylene sheet.

All collected decontamination water will be collected and sampled. Based on the results of the laboratory analysis, the decontamination water will be disposed on site or sent off-site for disposal.

ARCADIS

Appendix B

Hollow Stem Auger Drilling, Subsurface Soil Sampling Protocol and Temporary Monitoring Well Installation/Sampling

1. Hollow Stem Auger Drilling

The hollow-stem auger drilling method will be utilized for the drilling of soil borings and the installation of monitoring wells if rotasonic drilling methods are unnecessary. An ARCADIS field inspector will be present at the operating drill rig and will be responsible for the collection and logging of soil samples, monitoring of drilling decontamination operations, recording of groundwater data, deciding on final drilling depths (in consultation with the project manager), and preparing the boring logs. Additionally, the field inspector will maintain a log recording daily events, including arrivals and departures at the site by any and all personnel and equipment, and times of work start-up and stoppage. The forms to be used by the field inspector as part of the Quality Assurance/Quality Control (QA/QC) measures of the project are included in Appendix J.

This drilling technique involves rotating a drill bit into the subsurface on a string of auger flights. Soil cuttings are continuously lifted to land surface along the outside of the flights, while drill rods and a plug are used inside the flights to keep the soil out. The plug is removable for split-spoon sampling inside the flights.

Potable water may be used during drilling if required to keep loose sand from heaving inside the auger flights (due to differential hydrostatic pressure). Sand heaving would prevent collection of representative split-spoon samples and proper installation of well casing and screen. If water is added, the volume used will be carefully documented so that at a minimum, an equivalent volume will be removed during well development.

If any problems are encountered or questions arise during the field investigation that are beyond the scope of expertise/responsibility of the field inspector, she/he will temporarily halt all field activities in order to confer with the project manager. In this way, a technically sound decision will be made by several experienced individuals.

2. Formation Sampling

2.1 Split-Spoon Sampling

Split-spoon soil samples of unconsolidated sediments will be collected in 2-foot intervals from land surface to the total depth of drilling. These samples will be collected through the auger flights. An enlarged split-spoon sampler, which is 24 inches long and 3 inches in diameter, will be used for sampling. Drill cuttings will be examined in 2-foot intervals throughout the entire depth of the hole.

The collected split-spoon soil samples will be described, cataloged and retained by the on-site field inspector. It is the responsibility of the field inspector to ensure that between sample collections, the sampling device is cleaned according to the protocol outlined previously. In this way, if contamination is encountered at one elevation in the borehole, it will not be transferred to lower elevations in the borehole. A detailed soil sampling protocol is as follows:

1. The cleaned split-spoon sampler will be given to the driller (or helper), by the ARCADIS field inspector who will make sure that the individual is wearing clean, disposable gloves.

2. The split-spoon sample will then be collected by the driller using the standard penetration test. (ASTM D1586).

3. The ARCADIS field inspector will obtain the split-spoon sampling device from the driller and will place it on clean polyethylene sheeting.

4. The end cap will be unscrewed and the spoon opened to expose the sample.

5. The sample will be screened for volatile organic compound (VOCs) as discussed below.

6. The ARCADIS Sample/Core Log will be filled out as discussed below.

7. The sampling equipment will be cleaned as previously described.

After collection, split-spoon samples of unconsolidated material will be visually identified by the field inspector using the USCS classification System. The information recorded on the sample/core log by the field inspector will include:

- Soil sample interval
- Sampling hammer weight and distance of fall
- Blow count (per 6-inch interval)
- Amount of sample recovered
- Sample color

- Sample texture
- Sample moisture content
- Organic vapor readings
- Unusual characteristics
- Depth to water
- Drill rig behavior and penetration rate

An example sample/core log is present in Appendix J. Representative soil samples from each sampled interval will be placed in clean glass jars with screw-type lids for future reference. Each sample container will be labeled with the site name and the boring and sample number.

3. Analytical Sampling

3.1 Field Screening

Each split-spoon soil sample collected will be screened with a Photo-ionization Detector (PID). The information will then be recorded on the ARCADIS Sample/Core Log. Calibration procedures for the PID are in Appendix H.

3.2 Laboratory Analysis

A subset of soil samples may be containerized and submitted for laboratory analysis. The analytical parameters for each boring location are presented in the work plan. Soil samples will be transferred to clean, laboratory-supplied containers, preserved in accordance with the applicable analytical methodology, labeled, and placed in a cooler with ice.

3.3 Sample Labels and Chain-of-Custody Form

Sample labels are necessary for proper sample identification. The labels will be affixed to the sample containers prior to the time of sampling and will not be affixed to lids or caps. To track QA/QC handling protocols the labels will be filled out by sampling personnel, and the ARCADIS Chain-of-Custody form (see Appendix J) will be

completed in the field before the sampling team leaves the site. Labels will include sample identification, project number, date and time collected, and analyses to be performed.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in Appendix G.

4. Groundwater Sampling

Groundwater samples may be collected from discrete intervals within the designated HSA soil boring locations. Groundwater samples are collected using a standard one-inch temporary PVC well. New, clean temporary wells will be constructed for each designated boring. Dedicated polyethylene tubing will be lowered into the water column, and attached to a peristaltic pump, and the groundwater sample will be collected. In an attempt to minimize turbidity, every effort will be made to remove a minimum of one gallon of groundwater before the analytical sample is collected. In low yielding formations (till), this amount may not be achievable. Groundwater samples will be collected in laboratory containers, labeled and placed in an ice-filled cooler. Samples will be collected according to volatilization sensitivities. Sample shipment and chain-of-custody procedures will be followed according to procedures outlined in Appendix I.

5. Decontamination

The drilling casings, rods, samplers, tools, water tanks, drilling rig, and any piece of equipment that can come into contact (directly or indirectly) with the formation will be decontaminated on-site prior to set up for drilling. Decontamination protocols will also be followed between boreholes (at a fixed on-site location) and before leaving the site at the end of the project. The on-site decontamination activities will be monitored by the ARCADIS field inspector.

Equipment used to sample unconsolidated sediments (e.g. split-spoon samplers, stainless-steel spatulas) will be decontaminated prior to each sample collection. Disposable gloves will be worn while equipment is cleaned to avoid contamination and the gloves will be changed frequently. The procedure for cleaning this equipment is as follows:

1. Prepare a 2-percent solution of laboratory grade detergent and distilled water in a bucket.

2. Disassemble the split-spoon sampler and immerse the parts and spatula in the laboratory grade detergent solution.

3. Scrub equipment in the bucket with a brush to remove any adhering particles.

4. Rinse the equipment with copious amounts of distilled water.

5. Place clean equipment on a clean polyethylene sheet.

6. Reassemble the cleaned split-spoon sampler.

7. Transfer the split-spoon sampler to the driller (or helper) and make sure that this individual is wearing clean, disposable gloves.

All collected decontamination water will be collected and sampled. Based on the results of the laboratory analysis, the decontamination water will be disposed on site or sent off-site for disposal.

Appendix C

Hand Auger Sampling Procedures

1. Hand Auger Sampling Procedures

Hand auguring will be required to be performed in the sand tunnels underneath the Ford Twin Cities Assembly Plant to collect soil samples due to accessibility issues.

The hand auger consists of the auger bucket, a series of extensions, and a 'T' handle. The auger bucket is approximately 4 inches wide and 6 inches in height. The hand auger will be used to hand drill a hole to the desired depth determined in the work plan, and is withdrawn every 6 inches to either dump or collect soil.

2. Formation Sampling

Soil samples will be collected continuously to the total depth of the borehole at each designated location. Pushing the soils out of the sample barrel, a clean four-inch plastic bag will be used to collect samples continuously to the depth specified in the work plan. New plastic is used for each sample collection. A detailed soil sampling protocol is as follows:

1. Make sure all equipment has been properly cleaned prior to use.
2. Attach the auger bucket to a drill rod extension, and attach the 'T' handle to the drill rod.
3. Make sure the area to be drilled/sampled is cleared of debris before starting.
4. Begin augering in desired location, periodically (~ 6 inches) removing and depositing soil onto plastic sheeting.
5. When desired depth is reached for sampling, collect the sample from the auger bucket after auger is removed from the hole.
6. If more than one sample is taken from the same hole, be sure to thoroughly decontaminant all equipment between each sample.
7. Once the total depth is reached, abandon the hole per Minnesota Department of Health regulations.

After collection, soil samples of unconsolidated material will be visually identified by the field inspector using the USCS classification System. The information recorded on the sample/core log by the field inspector will include:

- Soil sample interval
- Amount of sample recovered
- Sample color
- Sample texture
- Sample moisture content
- Organic vapor readings
- Unusual characteristics
- Depth to water
- Drill rig behavior and penetration rate

An example sample/core log is present in Appendix J. Representative soil samples from each sampled interval will be placed in clean glass jars with screw-type lids for future reference. Each sample container will be labeled with the site name and the boring and sample number.

3. Analytical Sampling

3.1 Field Screening

Each soil sample collected will be screened with a Photo-ionization Detector (PID). The information will then be recorded on the ARCADIS Sample/Core Log. Calibration procedures for the PID are in Appendix H.

3.2 Laboratory Analysis

A subset of soil samples may be containerized and submitted for laboratory analysis. The analytical parameters for each boring location are presented in the work plan. Soil

samples will be transferred to clean, laboratory-supplied containers, preserved in accordance with the applicable analytical methodology, labeled, and placed in a cooler with ice.

3.3 Sample Labels and Chain-of-Custody Form

Sample labels are necessary for proper sample identification. The labels will be affixed to the sample containers prior to the time of sampling and will not be affixed to lids or caps. To track QA/QC handling protocols the labels will be filled out by sampling personnel, and the ARCADIS Chain-of-Custody form (see Appendix J) will be completed in the field before the sampling team leaves the site. Labels will include sample identification, project number, date and time collected, and analyses to be performed.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in Appendix J.

4. Decontamination

Any piece of equipment that can come into contact (directly or indirectly) with the formation will be decontaminated on-site prior to set up for augering. Decontamination protocols will also be followed between boreholes (at a fixed on-site location) and before leaving the site at the end of the project. The on-site decontamination activities will be monitored by the ARCADIS field inspector.

Equipment used to sample unconsolidated sediments (e.g. sample barrel, stainless-steel spatulas) will be decontaminated prior to each sample collection. Disposable gloves will be worn while equipment is cleaned to avoid contamination and the gloves will be changed frequently. The procedure for cleaning this equipment is as follows:

1. Prepare a 2-percent solution laboratory grade detergent and distilled water in a bucket.

2. Disassemble the split-spoon sampler and immerse the parts and spatula in the laboratory grade detergent solution.

3. Scrub equipment in the bucket with a brush to remove any adhering particles.

4. Rinse the equipment with copious amounts of distilled water.

5. Place clean equipment on a clean polyethylene sheet.

All collected decontamination water will be collected and sampled. Based on the results of the laboratory analysis, the decontamination water will be disposed on site or sent off-site for disposal.

ARCADIS

Appendix D

Groundwater Sampling Protocol

1. Groundwater Sampling Protocol

Valid water-chemistry data are integral to hydrogeologic investigations that characterize groundwater quality conditions. The data will be confirmed by quality-control measures instituted during sampling, sample handling, and analysis. Without checks on the procedures, contradictory results are possible, and incomplete or incorrect conclusions may result.

Quality control includes proper sampling procedures for well purging prior to sampling, sample-removal methods that utilize acceptable materials for all equipment and supplies, sample processing (including filtration, preservation, labeling, and bottle filling), and sample shipment. The ARCADIS project manager and field personnel will work closely with the analytical laboratory to assure that samples reach the laboratory in proper condition.

ARCADIS groundwater sampling protocol is based on standard practices as published in, "Manual of Ground-Water Sampling Procedures", by Scalf and others, NWWA/EPA, 1981 and "Handbook for Sampling and Sample Preservation of Water and Wastewater", EPA, 1982, as well as on ARCADIS' extensive experience.

Pertinent information regarding groundwater sampling procedures will be recorded on ARCADIS daily and sampling logs. Copies of these forms are included in Appendix J.

2. Preparation of Sampling Equipment

The sampling equipment will be thoroughly cleaned before each use. Any supplies, such as tubing or rope that cannot be properly cleaned after each use will be discarded in an appropriate manner. Water level measuring equipment will be cleaned with a laboratory-grade detergent solution, and rinsed with distilled water prior to use. A new length of polypropylene cord will be attached to a new dedicated bailer prior to the collection of each sample. Equipment, such as specific conductance, dissolved oxygen and pH meters, will be calibrated daily according to manufacturer's instructions.

3. Sampling Equipment

The equipment needed for sampling groundwater is listed below:

Electric water level probe	Thermometer
Clean towels	Sample bottles
Distilled water	Indelible marking pens
Plastic sheeting	Brushes
Polypropylene rope	Pump
Polyethylene Disposable Bailers	½ - inch Polyethylene tubing
Laboratory Grade Detergent	Clear tape
Buckets, graduated	Generator or Battery
Gloves (Nitrile, or equivalent)	Beakers
pH Meter and buffers	Ice
Multi-parameter probe	Coolers

4. Arrival at the Site

Upon arrival at the site, sampling personnel will check in with the appropriate personnel to coordinate sampling team activities and to obtain necessary clearances.

4.1 Opening the Well

Upon arrival at the well site, sampling personnel will check the well for aboveground damage, record the well designation, wipe the top of the well clean, and then remove the cap and wipe the top of the well casing with a clean cloth. Plastic sheeting will be placed around the well to protect sampling equipment from potential contamination.

4.2 Sounding the Well

The total depth of the wells will be measured (sounded) prior to sampling. With this information, the sampling team can calculate the volume to water in the well and determine if formation material has accumulated in the well. The well depth will be measured to an accuracy of 0.01 feet below the measuring point.

4.3 Measuring Well Stick-Up

The height of the measuring point above ground surface (the stick-up) will be measured to determine whether the well has been disturbed since installation. The stick-up will be measured to an accuracy of 0.01 feet.

4.4 Measuring the Water Level

Prior to purging and sampling, the static water level in the well will be measured and the volume of standing water in the well will be calculated. A full round of water levels will be taken prior to water sampling. The date and time of each measurement will be recorded. Each measurement will be made to an accuracy of 0.01 feet below the measuring point. Care will be taken to avoid cross contamination of the wells by thoroughly cleaning the measuring instrument between well sampling events.

Water levels will be measured in monitoring wells by using an electric water level probe and oil/water interface probe where separate-phase product is present or suspected. The measuring point, which is permanently marked on each well, will be used to assure consistent water-level readings. The procedure will be as follows:

1. The well will be identified and its number recorded.

2. The top of the well will be wiped with a clean cloth.

3. The well cap or plug will be removed; the inside of the casing will be wiped with a clean cloth; and the cap will be placed down in a manner so as to keep it clean. Personnel will wait approximately 10 minutes, if necessary, prior to measuring the water level to allow the water to stabilize.

4. The air within the well will be analyzed for VOCs by using a photoionization detector.

5. The first 5 feet of the steel measuring tape or electric probe will be cleaned as described above and then the depth to water will be measured from the top of the well casing.

6. The volume of water in the well will be calculated.

4.5 Purging the Well

Standing water will be removed from the well casing prior to collecting groundwater samples; a centrifugal pump, low-flow submersible pump or disposable bailer will be used The tubing from the pump will be set just below the anticipated dynamic (pumping) water level. New tubing will be dedicated to each well sampled.

The water level in the pumped well will be monitored in the event that it drops enough to make it necessary to reduce the discharge rate and/or lower the tubing. It is important that the entire water column volume be evacuated prior to sampling. The tubing will be set at the pumping water level and just prior to completion of the evacuation, the tubing will be lifted or the discharge increased so that suction is broken. The entire column of water will thus be removed from the well. Three to five times the calculated volume of water in the well will be removed so that the sample subsequently collected will be representative of the zone screened. The volume of standing water in each well will be calculated by subtracting the depth to water from the sounded depth of the well. This number will then be multiplied by a coefficient which relates the diameter of the well to gallons per linear foot to obtain the volume of standing water in the well.

4.6 Collection of Groundwater Sample

After a well has been evacuated, a groundwater sample will be collected with a disposable, bottom-filling bailer. The bailer will be lowered slowly so that the water surface is minimally disturbed. Water will enter the bailer through a hole in the bottom end plug and will be prevented from draining out by an inert ball check-valve. A polypropylene rope will be used to raise and lower the bailer, and the cord will be discarded after each well sampling event. The bailer will not come in contact with any surfaces outside of the well casing. Sampling personnel will wear a new pair of disposable gloves for each well sampled and when handling a clean bailer.

4.7 Filling the Containers

The containers will be inspected to ensure that they are the correct type and number, and if required, have the correct preservative. The labels will then be properly filled out and affixed to the containers. Water samples will be carefully poured into the containers, avoiding agitation or turbulence, which might result in loss of VOCs and/or excessive oxygenation of the samples. Care will also be exercised to avoid breakage and to eliminate the entry or contact of, any substance with the interior surface of the bottles, vials, or caps, other than the water sample being collected. Caps will not be removed until the actual sampling time and then just long enough to fill the container. The containers for volatile organic analyses will be topped off to eliminate any headspace or air bubbles and will be tightly closed with Teflon-lined septums held in place by open-top screw caps. The sample bottles will be prepared with appropriate preservatives prior to sampling, and the sample containers will be kept cool, dust-free, and out of the sun. The procedures that ARCADIS personnel will follow to collect groundwater samples are described below:

1. All containers will be labeled, marked according to project, well, date, etc., and wrapped with clear tape.

2. Clean gloves will be worn by personnel when they are handling a clean bailer.

3. The bailer will be placed on clean plastic sheeting. An appropriate length of new polypropylene cord will be attached to the bailer using a secure knot.

4. The bailer will be lowered into the well and into the water column gradually to minimize turbulence. The bailer will be allowed to sink and become fully submerged. Water from the first bailer will be discarded as a final rinse prior to sampling.

5. The 40 milliliter (ml) vials for VOCs will then be filled in such a manner as to ensure that there are no air bubbles.

6. After volatile organic samples have been collected, field parameters will be analyzed from the next water sample. The remaining sample containers will be filled in the order of the parameter's volatilization sensitivity.

7. The pH, specific conductance, ORP, dissolved oxygen, and temperature measurements, if required, will be taken after the meters have been calibrated, as necessary.

8. The well cap will be closed and the well will be locked.

9. Groundwater samples will be packed on ice in a cooler. The ARCADIS Water Sampling Log form and ARCADIS Chain-of-Custody form will be completed. Samples will be delivered or shipped to the laboratory within 24 hours after sample collection and the receiver's signature will be obtained on the Chain-of-Custody form.

10. The cord, gloves, bailer and sheeting will be discarded in a proper manner.

5. Field Analysis

If required, measurements for temperature, pH, ORP, dissolved oxygen, and specific conductance will be made in the field at the time of groundwater sampling because these properties change during sample storage. Field measurements will be recorded on the ARCADIS Water Sampling Log (see Appendix J) to track QA/QC protocols.

6. Quality Control

Quality-control (QC) samples will be used to monitor sampling and laboratory performance. The types of QC samples that will be included in this investigation are replicates and blanks. To ensure unbiased handling and analysis by the laboratory, the identity of QC samples will be disguised by means of coding so that the laboratory does not know which samples are included for QC purposes. Detailed QC procedures are outlined in the Quality Assurance Project Plan (QAPP).

6.1 Replicate Analyses

Replicate samples are samples collected from the same well and are identical within the limits of normal concentration fluctuations. Collection and analysis of such samples allow a check to be made on laboratory reproducibility. Five percent of all groundwater samples collected at this site will be replicated. The procedures to be used for taking replicate samples are discussed below.

When collecting samples for volatile organic compound (VOC) analysis, the water from the bailer will be distributed first to fill one VOC container and then to fill the second VOC container. Adequate water will be available to fill the bottles completely before they are capped. For other analytes, the bailer of water will be split to fill portions of each sample container until the containers are filled.

6.2 Blanks

Trip blanks will be incorporated into this field investigation. A trip blank is a sample composed of organic-free water (prepared by the laboratory) which is filled in the laboratory and travels unopened with the sample bottles. It is analyzed along with the field samples for the constituents of interest. Analysis of trip blanks detects whether samples have been contaminated by VOCs as a result of handling in the field, during shipment, or in the laboratory. One trip blank will accompany each day's shipment of water samples to the laboratory for VOC analysis. If multiple coolers of samples are shipped, a trip blank will be placed in each cooler.

7. Record Keeping

All ARCADIS personnel involved in sample collection will carefully document the handling history of all groundwater samples and blanks collected. Standard ARCADIS forms (see Appendix J) will be completed to document the integrity of each sample from the time the sampling team enters the site through sample collection and shipment.

7.1 Daily Log

Daily logs will be used by the field team for QA/QC purposes to record all sampling events and field observations. Entries in the daily logs will be dated by the person making the entry, and the logs will be kept in a secure, dry place. The following types of information will be included on the daily logs:

1. Date and time of arrival at site.

2. Client identification number.

3. Location.

4. Weather.

5. Sampling team members.
6. Work progression
7. QC samples.
8. Departure time.
9. Delays.
10. Unusual situations.
11. Well damage.
12. Departure from established QA/QC field procedures.
13. Instrument problems.
14. Accidents.

7.2 Well Sampling Log

The sampling team will prepare an ARCADIS Water Sampling Log for QA/QC purposes (see Appendix J) at the time of sampling to record information about each sample collected. In addition to project information and well evacuation data, the log includes the following information on sampling:

1. Date and time of sampling.
2. Well evacuation data.
3. Physical appearance of samples.
4. Field observations.
5. Results of field analyses.
6. Sampling method and material.

7. Sample parameters.

8. Sample container and preservation.

9. Sampling personnel.

7.3 Sample Labels and Chain-of-Custody Form

Sample labels are necessary for proper sample identification. The labels will be affixed to the sample containers prior to the time of sampling and will not be affixed to lids or caps. To track QA/QC handling protocols the labels will be filled out by sampling personnel and the ARCADIS Chain-of-Custody form will be completed in the field before the sampling team leaves the site. Labels will include sample identification, project number, date and time collected, analyses to be performed, and pH adjustment information where required.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in more detail in Appendix I.

ARCADIS

Appendix E

Surface-Water/Sediment
Sampling Protocol

1. Sample Collection - General

Sampling will not be conducted under adverse weather conditions, specifically during precipitation. The sampling stations will initially be evaluated by the sampling team to determine access and field conditions at the time of sampling. Any conditions which will interfere with the execution of sampling the manner described herein will be reported to the Project Manager.

Sampling will proceed from downstream locations to upstream locations. A suitable work area will be set up as close to the sampling station as possible. Plastic sheeting will be spread on the ground as a work surface for the sampling equipment.

The sampling team will be supplied with water-proof outer garments. Personnel will wear neoprene, nitrile or rubber boots which have been thoroughly decontaminated. Decontamination will consist of a laboratory grade detergent, potable water rinse and final rinse with distilled water. The location of the sampling station and the sample designations will be described on the ARCADIS Water Sampling Log. Other pertinent data including weather conditions and flow conditions will be recorded.

2. Surface-Water Sampling

2.1 Sampling Procedure

The station number where the sample is to be taken and sample designation will be recorded on the Water Sampling Log. Dedicated disposable pre-washed glass flasks supplied by the laboratory will be used to obtain the water samples. Care will be taken to avoid contact of the flask with any potential contaminants after its protective wrapping is removed. If enough water is present, the surface water will be sampled by lowering the flask from the surface to the bottom at an even speed, so that water enters the bottle from each depth yielding an integrated sample. Otherwise, as much water as possible will be collected into the flask by positioning the mouth of the flask in the upstream direction. Sampling team members will always position themselves downstream of the sample point, and will take care not to stir up sediment or soils when collecting the water samples. The sample will be transferred from the flask directly into the sample containers.

Sampling personnel will wear disposable plastic gloves during handling of sampling equipment and containers. The gloves will be disposed after sampling is completed at each station.

Sample shipment and documentation will be in accordance with Appendix I Chain-of-Custody Procedures.

2.2 Field Analyses

After the laboratory containers are filled, an additional sample will be collected in a clean, unpreserved glass container and its color, odor and appearance will be noted. The pH, temperature, turbidity, and specific conductance of the sample will be measured. Temperature will be measured immediately after collection of the sample in order to calibrate the pH and specific conductance meters.

pH will be measured with a glass hydrogen-ion electrode compared against a reference electrode of known potential by means of a pH meter. Calibration of the pH meter will be completed before analysis with two buffer solution standards bracketing the sample pH (nominal values of 4 and 7 or 7 and 11). Before a measurement is made, the probe will be completely rinsed with deionized or distilled water. The probe will be lowered into the sample and gently stirred and allowed to equilibrate. The pH will be recorded as soon as the reading on the meter equilibrates. Between measurements the probe will be rinsed with deionized or distilled water. The pH meter will be calibrated frequently during the sampling round to ensure accurate and precise measurements.

Specific conductance will be measured with a battery-powered specific conductance meter. The instrument will be adjusted to the temperature of the sample. The probe will be lowered into the sample and the reading taken within seconds after immersion. Before each sampling event, the probe will be rinsed with deionized or distilled water. The specific conductance meter will be calibrated frequently to ensure accurate and precise measurements. The field analyses and sample descriptions will be recorded on ARCADIS Water Sampling Log.

3. Sediment Sampling

Equipment: Small diameter solid probe, Stainless-Steel hand driven T-handle core sampler, sediment baskets for sampler, PVC or stainless-steel sleeve of at least 2-inch greater diameter than sampling device, alconox detergent, 10% HNO_2 solution, three spray bottles, measuring tape, large plastic cooler with ice, four 1-gallon plastic containers for in-field waste liquid disposal.

1. Prior to sampling, all equipment should be thoroughly cleaned with a laboratory grade detergent, and then rinsed three times with de-ionized (DI) water. Stainless steel sampling equipment should then be sprayed with 10% HNO_2, and finally rinsed with DI.

2. Upon reaching the sampling location, the depth of sediments should be probed with the solid rod in a location near (but down stream) where the samples will be collected from.

3. The PVC sleeve or stainless-steel tube should be set through the water column firmly into the sediment.

4. The hand-driven sampling apparatus should be assembled and it should be ensured that the sediment basket is properly inserted.

5. The sampler should be inserted into the sleeve and the driving apparatus connected.

6. The sampler should then be driven to collect the sediment from the first 6 inches of sediment in the bottom of the stream.

7. Advance the sleeve to the approximate depth of the leading edge of the sampling device.

8. Carefully remove the sampling device from the hole by turning the tube in a twisting motion to break the connection between the sediments in the tube and the underlying material.

9. Open the sampling device and record a description of the sediments on the sample log-sheet then place the appropriate sediments into the sample containers and preserve accordingly.

10. Decontaminate the sample probe.

11. Repeat as necessary to collect the number of samples specified in the field sampling plan.

ARCADIS

Appendix F

Surface Soil and Waste Material Sampling Protocol

1. Surface Soil and Waste Material Sampling Protocol

Surficial soil samples will be collected from the upper 2 inches of soil using a pre-cleaned trowel or spade. Vegetation will be removed from the designated sampling area. A sufficient number of discrete grab samples will be collected for the required sample volume.

Sampling personnel will wear disposable gloves during the handling of sampling equipment and sample containers. Sampling equipment will be decontaminated before use and between sample locations.

Samples for chemical analysis will be packaged as efficiently and expeditiously as possible. If sample recovery is insufficient, a second core or trowel will be retrieved as close to the original location as possible. Samples will be transferred directly to the sample containers.

A representative sample will be retained and examined by the field hydrogeologist. The description will be recorded along with the other pertinent sampling information on an ARCADIS. Sample/Core Log. The sample will be screened with a photoionization detector at the time of examination. The meter will be calibrated and used in accordance with Appendix H, Field Instrumentation Operating Procedures.

An equipment blank will be collected to assess the decontamination procedures used during sample collection. The sample will be prepared by pouring organic-free water over the trowel (which has been decontaminated and is ready for sampling) and then into the sampling container(s). One equipment blank will be incorporated into the sampling program for each day's collection of samples and will be analyzed for the same suite of constituents as the soil samples. Blank analyses are discussed in more detail in the QAPP.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in more detail in Appendix I

ARCADIS

Appendix G

Geophysical Logging

1. Geophysical Logging

A geophysical study will be conducted using EM-31 and EM-61 frequency domain electromagnetic methods (EM). This done by inducing electrical currents in the subsurface by electromagnetic waves generated on the surface. The geophysical surveys will be used to first identify any metallic properties in the subsurface. A second survey will be preformed to determine changes in electrical conductivity from difference in soil types, disturbances etc. that could result from waste disposal. The field work will be preformed by a subcontractor with oversight provided by ARCADIS to ensure accuracy and safety.

ARCADIS

Appendix H

Field Instrumentation Operating Procedures

1. Field Instrumentation Operation Procedures

Field instruments used during the investigation will be calibrated and operated in accordance with the following standard operating procedures and with the manufacturers' instructions.

1.1 Air Monitoring Equipment

- A photoionization detector (PID) with a 11.7 electronvolt (eV) lamp will be used on a semi-continuous basis during intrusive field operations (drilled, sampling, etc.).

- Calibration of the instrument shall be performed on-site prior to use on a daily basis. The calibration gas will consist of a supply of zero air and mixture of 100 parts per million (ppm) isobutylene and air. The calibration procedure is detailed in the manufacturer's instructions.

1.2 Field Analysis Instruments

Field analysis of groundwater may include measurements of pH, temperature, ORP, dissolved oxygen, and specific conductance. Field instruments for the measurement of pH and specific conductance will be calibrated with standard solutions prior to sampling. Calibrations will be recorded in the field book.

Appendix I

Chain-of-Custody Procedures

1. Chain-of-Custody Procedures

1. The field personnel will be responsible for maintaining custody of the samples until they are delivered to the overnight common carrier or courier for shipment to the laboratory. All samples shipped to a laboratory will be accompanied by the ARCADIS Chain-of-Custody Record (see Appendix J). The Chain-of-Custody Record will be completed in the field; the original form will accompany the shipment, and a copy will be retained by the field hydrogeologist in the field project file.

2. A separate Chain-of-Custody Record will be filled out for the contents of each shipment container (cooler). The form will be placed in a plastic bag and taped to the underside of the lid of the cooler.

3. To provide a means of detecting any potential tampering during shipment, all shipment containers (coolers) will be affixed with signed sample seals. Two seals will be affixed to each cooler on opposite ends. In addition, a 2-inch wide transparent tape will be wrapped entirely around the cooler.

4. If the shipment is sent by common courier, an air bill or bill of lading will be used. Receipts from courier, air bills, and bills of lading will be retained in the field project file.

The chain of custody must include at a minimum the following information:

- Project number.
- Project name.
- Laboratory name.
- Sampler(s) name.
- Unique Sample Identification.
- Sample collection time and date.
- Sample type (water, soil, etc.).
- Sample bottle/container description.

- Analyses to be performed.
- Number of containers per analysis.
- Signature spaces for persons controlling and releasing sample possession.
- Sample delivery method.

Direct Push Drilling, Subsurface Soil Sampling Protocol, and Temporary Monitoring Well Installation / Sampling

Field Sampling Plan

September 14, 2007

Direct Push Drilling, Subsurface Soil Sampling Protocol, and Temporary Monitoring Well Installation/Sampling

1. Direct Push Soil Borings

The direct push soil borings method will be utilized for the drilling of soil borings at locations where the anticipated geology would deem this technique applicable. An ARCADIS field inspector will be present at the operating drill rig and will be responsible for the collection and logging of soil samples, monitoring of drilling decontamination operations, recording of groundwater data, deciding on final drilling depths (in consultation with the project manager), and preparing the boring logs. Additionally, the field inspector will maintain a log recording daily events, including arrivals and departures at the site by any and all personnel and equipment, and times of work start-up and stoppage. The forms to be used by the field inspector as part of the Quality Assurance/Quality Control (QA/QC) measures of the project are included in Appendix J.

This drilling technique involves pushing a 48 inch or 60 inch core barrel into the subsurface. The core barrel is lined with an open ended sample liner. The tip of the core barrel contains a cutting shoe and is open at the leading end. The leading end is driven hydraulically into the ground and then pulled back to retrieve the sample. A new liner is placed in the tube, additional core barrel is attached and the core barrel is advanced down the existing hole. If the soil is not stable, a retractable drill point will be placed on the tip of the cutting shoe. The point is held in place by a 1.25 inch outer diameter (OD) center rod. Once the rod has reached the appropriate sample depth, the center rod is removed and the core barrel is advanced. The core sample is then removed by pulling out of the hole and the point is retrieved from the top of the sample. This is completed until the total depth of sampling is reached.

Dual tube direct push technique can also be used if soil conditions deem it necessary. Dual tube consists using two sets of probe rods to retrieve a continuous soil core. This is comprised of a larger diameter (3.25 inch OD) outer casing and a smaller diameter (1.75 – 1.85 inch OD) core barrel with liner. The tooling is advanced into the subsurface. The inner rods are removed and the sample core is then retrieved leaving the outer casing in place. A new sample sheath and liner are placed back in the outer casing and an additional larger diameter is placed on the string. The rods are advanced further into the subsurface and the core sample is extracted as described above. If necessary a retractable drive tip will be placed on the tip of the inner core barrel to allow the rods to be driven through a pre-cored boring or undisturbed hole to the desired depth.

If any problems are encountered or questions arise during the field investigations that are beyond the scope of expertise/responsibility of the field inspector, she/he will temporarily halt all field activities in order to confer with the project manager. In this way, a technically sound decision will be made by several experienced individuals.

2. Formation Sampling

Core Barrel Sampling

Core barrel soil samples of unconsolidated sediments will be collected in 4-foot or 5-foot intervals from land surface to the total depth of drilling. These samples will be collected through the sample liners. A core barrel sampler, which is 48 inches or 60 inches long and 1.75 to 3 inches in diameter, will be used for sampling. Actual sizes will depend on the tooling of drilling contractor. Drill cuttings will be examined in 2-foot intervals throughout the entire depth of the hole.

The collected core barrel soil samples will be described, cataloged and retained by the on-site field inspector. It is the responsibility of the field inspector to ensure that between sample collections, the sampling device is cleaned according to the protocol outlined previously. In this way, if contamination is encountered at one elevation in the borehole, it will not be transferred to lower elevations in the borehole. A detailed soil sampling protocol is as follows:

1. The cleaned core barrel sampler will be given to the driller (or helper), by the ARCADIS field inspector who will make sure that the individual is wearing clean, disposable gloves.

2. The core barrel sample with liner will then be collected by the driller.

3. The ARCADIS field inspector will obtain the sample liner from the driller and will place it on clean polyethylene sheeting.

4. The liner will be opened by cutting the liner down the length of the liner to expose the sample.

5. The sample will be screened for volatile organic compound (VOCs) as discussed below.

6. The ARCADIS Sample/Core Log will be filled out as discussed below.

7. The sampling equipment will be cleaned as previously described.

After collection, core barrel samples of unconsolidated material will be visually identified by the field inspector using the USCS classification System. The information recorded on the sample/core log by the field inspector will include:

- Soil sample interval
- Amount of sample recovered
- Sample color
- Sample texture
- Sample moisture content
- Organic vapor readings
- Unusual characteristics
- Depth to water
- Drill rig behavior and penetration rate

An example sample/core log is present in Appendix J.

3. Analytical Sampling

3.1 Field Screening

Each core barrel soil sample collected will be screened with a Photo-ionization Detector (PID). The information will then be recorded on the ARCADIS Sample/Core Log. Calibration procedures for the PID are in Appendix H.

3.2 Laboratory Analysis

A subset of soil samples may be containerized and submitted for laboratory analysis. The analytical parameters for each boring location are presented in the work plan. Soil samples will be transferred to clean, laboratory-supplied containers, preserved in

accordance with the applicable analytical methodology, labeled, and placed in a cooler with ice.

3.3 Sample Labels and Chain-of-Custody Form

Sample labels are necessary for proper sample identification. The labels will be affixed to the sample containers prior to the time of sampling and will not be affixed to lids or caps. To track QA/QC handling protocols the labels will be filled out by sampling personnel, and the ARCADIS Chain-of-Custody form (see Appendix J) will be completed in the field before the sampling team leaves the site. Labels will include sample identification, project number, date and time collected, and analyses to be performed.

The sampling team will be responsible for maintaining custody of the samples until they are delivered to the carrier or the laboratory. The Chain-of-Custody form will then be signed and custody formally relinquished. The containers (bearing custody seals) will be in view at all times or will be stored in a secure place restricted to authorized personnel. Chain-of-Custody procedures are discussed in Appendix G.

4. Groundwater Sampling

Groundwater samples may be collected from discrete intervals within the designated direct push soil boring locations. Groundwater samples are collected using a standard one-inch temporary PVC well. New, clean temporary wells will be constructed for each designated boring. Dedicated polyethylene tubing will be lowered into the water column, and attached to a peristaltic pump, and the groundwater sample will be collected. In an attempt to minimize turbidity, every effort will be made to remove a minimum of one gallon of groundwater before the analytical sample is collected. In low yielding formations (till), this amount may not be achievable. Groundwater samples will be collected in laboratory containers, labeled and placed in an ice-filled cooler. Samples will be collected according to volatilization sensitivities. Sample shipment and chain-of-custody procedures will be followed according to procedures outlined in Appendix I.

5. Decontamination

The drilling casings, rods, samplers, tools, water tanks, drilling rig, and any piece of equipment that can come into contact (directly or indirectly) with the formation will be decontaminated on-site prior to set up for drilling. Decontamination protocols will also

be followed between boreholes (at a fixed on-site location) and before leaving the site at the end of the project. The on-site decontamination activities will be monitored by the ARCADIS field inspector.

Equipment used to sample unconsolidated sediments (e.g. core barrel samplers, stainless-steel spatulas) will be decontaminated prior to each sample collection. Disposable gloves will be worn while equipment is cleaned to avoid contamination and the gloves will be changed frequently. The procedure for cleaning this equipment is as follows:

1. Prepare a 2-percent solution of laboratory grade detergent and distilled water in a bucket.

2. Disassemble the core barrel sampler and immerse the parts and spatula in the laboratory grade detergent solution.

3. Scrub equipment in the bucket with a brush to remove any adhering particles.

4. Rinse the equipment with copious amounts of distilled water.

5. Place clean equipment on a clean polyethylene sheet.

6. Reassemble the cleaned core barrel sampler.

7. Transfer the core barrel sampler to the driller (or helper) and make sure that this individual is wearing clean, disposable gloves.

All collected decontamination water will be collected and sampled. Based on the results of the laboratory analysis, the decontamination water will be disposed on site or sent off-site for disposal

Amendment 1- Appendix D

Groundwater Sampling Protocol

Field Sampling Plan

December 18, 2007

1. Field Filtered Groundwater Samples

Groundwater samples that are collected for dissolved metals will be field filtered using a clean 0.45 micron disposable filter for each well. For wells that are purged and sampled using a bailer the groundwater collected will be transferred to a clean 1000 mL beaker at each well. A plastic disposable 60 mL syringe will be used to push the water through the filter into the appropriate bottle

For wells that are purged and sampled using a Grundfos™ pump, water will be pumped through the 0.45 micron disposable filter and into the appropriate bottle. The filter will be connected one half inch poly tubing from the pump utilizing Masterflex™ tubing.

ARCADIS

Amendment 3

Field Sampling Plan dated
June 18, 2007

Amendment Dated
January 23, 2008

1. Sample Nomenclature

Location: A sample designation system has been development and implemented to identify samples for laboratory analyses. Each location has a unique sample location name. Since other sample nomenclature has already been developed, excavation confirmation location samples completed by ARACDIS in the same manor and will start with an A, followed by an E and number to designate the excavation area. Following the E, the letters CS and a three digit number shallow follow to provide a unique identifier for each sample location. The following will be a sample prefix designation that will be employed at TCAP to identify excavation confirmation soil samples:

A_E01_CS ARCADIS Excavation Area Confirmation Sample

For example, a confirmation sample collected from excavation area 1 on January 23, 2008 would be labeled: A_E01_CS-001 (20080123)

1. Sample Nomenclature

Location: A sample designation system has been development and implemented to identify samples for laboratory analyses. Each location has a unique sample location name. Since other sample nomenclature has already been developed, excavation confirmation location samples completed by ARACDIS in the same manor and will start

with an A, followed by an SP and number to designate the seep sample area. Following the SP, a two digit number shall follow to provide a unique identifier for each sample location. The following will be a sample prefix designation that will be employed at TCAP to identify excavation confirmation soil samples:

ASP-01 ARCADIS Seep Sample

For example, a seep sample collected from seep area 1 on April 25, 2008 would be labeled: ASP-01 (20080425)

2. Seep Sampling Procedure

Sampling will not be conducted under adverse weather conditions, specifically during precipitation. The sampling stations will initially be evaluated by the sampling team to determine access and field conditions at the time of sampling. Any conditions which will interfere with the execution of sampling the manner described herein will be reported to the Project Manager.

Sampling will proceed from shallow lithology to deeper lithology. A suitable work area will be set up as close to the sampling station as possible. Plastic sheeting will be spread on the ground as a work surface for the sampling equipment.

The location of the sampling station and the sample designations will be described on the ARCADIS Water Sampling Log. Other pertinent data including weather conditions and flow conditions will be recorded.

2.1 Sampling Procedure

The station number where the sample is to be taken and sample designation will be recorded on the Water Sampling Log. Dedicated disposable pre-washed beakers will be used to obtain the water samples. Care will be taken to avoid contact of the beaker with any potential contaminants after its protective wrapping is removed. If enough water is present, the seep water will be sampled by funneling the water from the seep to the beaker. Sampling team members will always position themselves away from the sample point, and will take care not to stir up sediment or soils when collecting the water samples. The sample will be transferred from the beaker directly into the sample containers.

Sampling personnel will wear disposable plastic gloves during handling of sampling equipment and containers. The gloves will be disposed after sampling is completed at each station.

Sample shipment and documentation will be in accordance with Appendix I Chain-of-Custody Procedures.

2.2 Field Analyses

After the laboratory containers are filled, an additional sample will be collected in a clean, unpreserved glass container and its color, odor and appearance will be noted. The pH, temperature, oxidation-reduction potential, and specific conductance of the sample will be measured using a mutli-paramter probe. The mutli-paramter probe will be calibrated prior to analysis. The multi-parameter probe will be deconed in between each seep sample with deionized or distilled water. The field analyses and sample descriptions will be recorded on ARCADIS Water Sampling Log.

1. Location and Sample Nomenclature (Revision 1.0)

Location: A sample designation system will be used to identify samples for laboratory analyses. A list of identifiers used for each sample will be maintained in the project logbook by the ARCADIS Field Team Leader.

Each location will have a unique sample location name. Since soil borings and monitoring wells have previously been completed at the site, investigative locations completed by ARCADIS will start with A, followed by a one to two letter designation to describe the type of sample. A four digit number and up to two letter designation will then follow to provide a unique identifier for each sample location. The first set of two numbers will designate the Focus Area of the boring, and the second set of two numbers will give the sequential designation. For delineation locations, the letters represent the direction from the original boring location. The following are sample prefex designations that will be employed at TCAP to identify sample locations.

ASB — Soil Boring

AMW- Monitoring Well

AHA – Hand Auger Boring

ASD – Sediment Location

AS – Surface Soil Location

AWS -Wipe Sample Location

ST – Sheen Test

Samples: Each sample that is collected will be designated by a unique sample identification number. The first part of the identifier will correspond to the location and the second part of the sample by the sample depth (if applicable) and the sample date. For example, a soil sample collected within Focus Area 1 from soil boring 1 from 4-6' on July 25, 2013 would be labeled: ASB-0101_4-6 (20130725). A water sample collected from this location would be referenced by ASB-0101_7-12 (20130725). The screened interval of the temporary well will also be noted in the field book. Repetitive sampling points, such as samples collected from groundwater monitoring wells, will be suffixed by the date collected.

Equipment blanks and trip blanks will be unique and identified by their associated prefix numbered sequentially (to differentiate between multiple samples collected on the same date), and suffixed by the date. The ARCADIS sampler will note each equipment blank and its corresponding sampling equipment in the field book.

EB - Equipment Blank	Ex. EB (20130725)
TB- Trip Blank	Ex. TB (20130725)

In the event that one or more EB or TB samples are collected on the same date, a number will be suffixed after the sample name. Ex. EB-01 (20130725)

Field duplicates will be identified with a unique sample identification number; such that the laboratory will not be aware that the sample is a duplicate (duplicates will be numbered sequentially). The ARCADIS Field Team Leader will note in the logbook where the duplicate samples were collected so this information will be available when the laboratory data is reviewed

DUP – Duplicate Sample Ex. DUP-001

Unlike the other quality assurance samples, MS/MSD samples are not separate samples; therefore, they are not assigned unique sample numbers. The only difference between a MS/MSD sample and a standard sample is that additional sample volume is collected at the location where the MS/MSD sample is obtained. These samples will be identified by adding a "MS" and "MSD" to the identifier of the sample where the MS/MSD sample is collected.

APPENDIX G

Standard Operating Procedures

EXECUTIVE SUMMARY

Damaging an underground or above ground utility can result in serious injury and loss of life, disrupt essential services, and create significant liability to ARCADIS, clients and subcontractors. Therefore, it is ARCADIS' policy that the following steps be completed prior to beginning any subsurface intrusive work:

- The presence of existing or known utilities will be investigated and cleared (to the extent feasible) by locating, marking, and, where appropriate, visually verifying (potholing) before the start of any subsurface intrusive work.
- A minimum of **three (3) reliable lines** of evidence are required for an acceptable utility clearance. Each location of subsurface intrusive work must have at least 3 reliable lines of evidence. All lines of evidence used during the utility clearance procedure will be recorded on the Utility and Structures Checklist of equivalent client provided checklist or permit. If a line of evidence is lost or not apparent, STOP WORK, and reestablish the line of evidence prior to resuming subsurface intrusive work. The Utility Structures and Checklist is valid for 15 business days from the date of completion.
- The lines of evidence used will be reasonable and appropriate for the conditions expected to be encountered (soil type, water table, etc.) and the type of utilities expected to be encountered (e.g., gas line versus an irrigation line).
- Contact the State One Call or equivalent service (Nationwide "811") as required by law. The State One Call or equivalent service (Nationwide "811") can only be used as a reliable line of evidence when working within the public right of way or easement.
- For point clearance (single intrusive point, used as 1 of the 3 required reliable lines of evidence) the borehole must be cleared to 110% of the diameter of the intrusive device (i.e. auger, drill head, etc.) or an additional 2 inches of overall diameter, whichever is greater.
- Utility clearance information will be documented on the ARCADIS Utility and Structures Checklist (USC) or equivalent client provided checklist or permit.
- Employees overseeing utility clearance activities will:
    - Be familiar with the contents of this standard & ARC HSFS-019 Supplement 2;
    - Have one year field experience in the identification of utilities; and
    - Have training and six months experience in the proper operation and results interpretation of any clearance equipment used by ARCADIS employees, including without limitation, magnetometers and ground penetrating radar.
- All utility strikes must be reported to Corporate Health and Safety and Legal within 24 hours using the Utility Line Strike Investigation Form. **Do not enter the incident into 4-Sight until approved to do so by Corporate Legal. Refer to ARC HSFS-019 Supplement 5, Utility Strike Emergency Action Plan Guidelines.**

Report Utility Incident Now

1. POLICY

It is the practice of ARCADIS and its affiliated companies to implement appropriate, reasonable and practical standards within acceptable and customary industry practices to promote the health and safety of its employees, and avoid and mitigate exposure of risk in the performance of their work. In furtherance of this policy, ARCADIS promotes and encourages compliance by all employees with this policy and standards relating to work in the vicinity of subsurface, submarine or aboveground utilities.

2. PURPOSE AND SCOPE

2.1 Purpose

This standard directs general safety standards and best practices associated with the identification and management of subsurface, submarine and aboveground utilities on project sites. Utility location SOP for submarine utilities can found in ARC HSFS-019 Supplement 6.

2.2 Scope

This standard assigns responsibilities and expectations for proper utility clearance by both ARCADIS employees and ARCADIS subcontractors at project sites.

3. DEFINITIONS

Definitions relating to Utility Clearance can be found in Exhibit 1.

4. RESPONSIBILITIES

4.1 Project Manager Responsibilities

For every project site having the potential to come into contact with utilities, Project Managers must ensure that:

- The requirements of this standard are followed.
- Local regulations governing utility clearance are followed. This includes ensuring local and or state laws defining activities or depth of intrusive work/excavation requiring utility clearance are reviewed as they vary by location. For further information refer to One-Call and State Law Directory.
- Efforts are made to work with the client, project site representatives and subcontractors to identify the nature of any utilities, and to determine what control processes need to be implemented by ARCADIS and the subcontractors to prevent damage to these utilities and to properly manage the effects in the event there is utility damage.
- Utility clearance activities are only delegated to a Task Manager or other individual meeting the requirements of section 4.2 below, as appropriate. However, even if the Project Manager delegates certain responsibilities, the Project Manager maintains primary responsibility for a complete utility clearance. For additional information on PM responsibilities and best practices refer to ARC HSFS-019 Supplement 1.

- Project Managers or designee must review the Utility and Structures Checklist with staff and AUS subcontractors (including "Sub-of-Subs" when conducting subsurface intrusive work) conducting subsurface intrusive work, prior to staff beginning subsurface intrusive work. The PM or designee review must be documented on the Utility and Structures Checklist prior to starting subsurface intrusive work.

4.2 Field Personnel Responsibilities

ARCADIS field personnel conducting work on a project site having the potential to come into contact with utilities have the responsibility to:

- Read, understand, and follow this standard and ARC HSFS-019 Supplement 2 and complete the appropriate checklists during the on-site utility locate process.
- Complete a minimum of 1 year of utility clearance related experience before accepting responsibility for any utility clearance tasks.
- Complete training and have 6 months of experience in operating and interpreting the results of remote sensing technologies, including without limitation, magnetometers and ground penetrating radar, before operating such technologies. Field staff should understand the technologies being utilized by a private utility locate contractor, and how they are operating in comparison with the site conditions. Refer to ARC HSFS-019 Supplement 3 for more information.
- Prior to beginning subsurface intrusive work the Utility and Structures Checklist must be completed and signed off on by the staff member completing or overseeing the clearance. Confirm that the Utility and Structures Checklist was reviewed by the Project Manager or designee as discussed in Section 4.1 above. Review the Utility and Structures Checklist daily during subsurface intrusive activities to insure all utilities are identified and markings are present.
- Use their STOP WORK Authority to eliminate any reasonable concern if utilities cannot be reasonably located and contact the Project Manager to review the STOP WORK situation and confirm the direction of action moving forward.
- Ensure that ARCADIS subcontractors conduct their own reasonable independent utility clearance efforts as required by ARCADIS' standard subcontract, and are aware of any ARCADIS clearance standards used onsite.
- Be on site during utility locate activities, and any active subsurface intrusive activities involving contractor under contract to ARCADIS.

4.3 ARCADIS Subcontractor Responsibilities

According to ARCADIS' standard subcontract, subcontractors have agreed to take responsibility for any damages resulting from a utility impact caused by their work. Therefore, ARCADIS subcontractors are expected to take reasonable time and diligence to conduct their own independent utility clearance using reasonable standards and processes. Subcontractors have the responsibility to

stop their work if utility concerns are identified and will report those concerns to the ARCADIS employee overseeing their work activities. ARCADIS staff should reinforce these responsibilities with subcontractors during job safety briefings.

In jurisdictions where the actual contractor performing the subsurface intrusive work activity is required to perform utility clearance notifications, the contractor will perform the clearance notification and will provide evidence of the notification to ARCADIS (ticket or ticket number, etc.). Refer to ARC HSFS-019 Supplement 4 for Best Practices for State One Call procedures.

5. STANDARD

5.1 General

Protocols to be followed during utility clearance activities are outlined in:

- Best Practices for Project Managers (or Their Delegates) Concerning Utility Clearance (ARC HSFS-019 Supplement 1).
- Best Practices for Field Personnel Concerning Utility Clearance (ARC HSFS-019 Supplement 2).
- Use and Limitations of Common Underground Locating Technologies and Clearance Methods (ARC HSFS-019 Supplement 3)
- Best Practices for State One Call Procedures (ARC HSFS-019 Supplement 4)
- Emergency Action Plan guidelines for Utility Strikes (HSFS-019 Supplement 5)
- Utility Location Standard Operating Procedure for Aquatic Work Activities (ARC HSFS-019 Supplement 6)

5.2 Lines of Evidence

A minimum of 3 lines of evidence are required for an appropriate utility clearance as defined in this standard. Each location of subsurface intrusive work must have at least 3 reliable lines of evidence. All lines of evidence used during the utility clearance procedure will be recorded on the Utility and Structures Checklist of equivalent client provided checklist or permit. If a line of evidence is lost or not apparent, STOP WORK, and reestablish the line of evidence prior to resuming subsurface intrusive work. Generally, the following lines of evidence may be used to meet this minimum utility clearance requirement.

1. Contacting the State One Call or equivalent service (Nationwide "811") is required by law, regardless if it will be used as a line of evidence. Contacting the State One Call or equivalent service (Nationwide "811") is an acceptable reliable line of evidence when working within the public right of way or easement. Note that One Call can provide valuable information regarding locations and types of utilities entering the private property.

View the Utilities and Structures Checklist

Note: For work on private property or in areas not served by State One Call or equivalent service, consider using a reputable private utility locating company to locate and mark the utilities. Use of a private utility locator is encouraged for all projects with subsurface or submarine utilities. When working with a private locater it is best practice to pre-plan clearance areas, review required clearance equipment and the re-clearing/confirmation of any public utility mark outs (State One Call or equivalent service Nationwide "811");

2. Use detailed scaled site utility plans, preferably in the form of an "as-built" or "record" drawing, to identify and/or confirm utility locations. Document request and/or receipt of utility drawings from the property owner/client on the Utilities and Structures Checklist;

3. Interview(s) with knowledgeable site or client personal. The following questions should be asked during the interview and answers documented on the Utility and Structures Checklist:

   - Employees(s) Name and Affiliation(s) with the site
   - Types of utilities , including utility composition and location of utilities onsite
   - Depths of known utilities
   - Any other pertinent information regarding utilities on the site; or

4. Conduct a detailed visual site inspection of areas around all planned subsurface intrusive work points or areas to identify and/or confirm utility locations. For underground utilities, conduct an inspection for structures that tend to indicate the presence and general location of such utilities, including, but not limited to manholes, vaults, valve covers, valve markers, telephone pedestals, transformer housings, fire hydrants, spigots, sprinkler heads, air relief valves, backflow preventers, meters, downspouts going into the subsurface, power poles with wiring going into the subsurface and line markers. Saw cut lines and concrete /asphalt repairs often yield valuable information regarding utility locations. Always discuss the presence of utilities with the site owner, operator and/or occupant to identify any potential utilities that might not be readily identified by non-intrusive clearing methods or may be:

   - At depths > 5 ft. below ground surface; or
   - At very shallow depths (< 2ft below ground surface) such as communication lines, electrical conduits/wiring, irrigation lines, etc.

If one of the above lines of evidence cannot be utilized, or if using the above lines of evidence does not adequately identify utilities with reasonable certainty, one or more additional lines of evidence must be utilized. Commonly used lines of evidence are listed on the Utility and Structures Checklist.

A discussion of use and limitations associated with common utility location and clearance methods is provided in ARC HSFS-019 Supplement 3.

Standard operating procedures for utility location in subaquatic settings are presented in ARC HSFS-019 Supplement 6.

The lines of evidence will be recorded on the Utility and Structures Checklist or equivalent client provided checklist or permit.

Note: If a line of evidence is lost, utility markings removed / worn, or area of previous clearance not confirmed, STOP WORK and reestablish the line(s) of evidence prior to resuming subsurface intrusive work. Each location of subsurface intrusive work must have 3 reliable lines of evidence. All lines of evidence used during the utility clearance procedure will be recorded on the Utility and Structures Checklist of equivalent client provided checklist or permit. If a line of evidence is lost or not apparent STOP WORK, and reestablish the line of evidence prior to resuming subsurface intrusive work. The Utility Structures and Checklist is valid for 15 business days from the date of completion.

5.3 Color Codes Used for Utility Markings

The following colors are used for marking utilities. Some government agencies or large industrial facilities may use additional colors not provided below. ARCADIS policy is to assume any paint marking or pin flag color not provided below is a subsurface utility marking until proven otherwise.

If utilities or subsurface anomalies are identified but the utility type or anomalies are not classified it is recommend that a pink (Temporary Survey Marking) marking be used. Once the type of utility is established the pink marks should be repainted / remarked to represent the correct type of utility.

COLOR	Utility Line
WHITE	Proposed Excavation
PINK	Temporary Survey Markings
RED	Electrical Power Lines, Cables, Conduit and Lighting Cables
YELLOW	Gas, Oil, Steam, Petroleum or Gaseous Materials
ORANGE	Communication, Alarm or Signal Lines, Cables or Conduit
BLUE	Potable Water
PURPLE	Reclaimed Water, Irrigation and Slurry Lines
GREEN	Sewer and Drain Lines

APWA and ANSI standard Z-53.1

5.4 Locating Technologies

There are several types of locating technologies that can be used to identify and locate utilities in the subsurface. Project teams need to work closely with private utility locators (PUL) in order to best match locating technology with site conditions. To provide the best results all possible locating technologies should be available for use and implementation at the project location. Any potential

interferences should also be discussed up front and then at the project site during utility location activities. Potential interferences could be soil moisture, soil type, standing water on concrete/asphalt, rebar, fencing, and metal structures that are in the subsurface. Employees overseeing locating technology activities should have an understanding of device operation and limitations. For further information refer to ARC HSFS-019 Supplement 3, Use and Limitations of Common Utility Location Technologies and Clearance Methods.

5.5 Clearance Methods

In some cases, proposed subsurface intrusive locations may be pre-cleared using other intrusive methods. Determine the clearance or soft dig method based on site conditions and utilize the least invasive method possible. The number of subsurface intrusive locations and soil type should be taken into consideration. The following clearance methods are listed from least invasive to most:

1. Vacuum Extraction/Potholing (air or water based),
2. Air knifing,
3. Hydro knifing,
4. Probing,
5. Hand auguring
6. Hand digging, and
7. Posthole digging.

Single point clearance must be 110% of the proposed subsurface intrusive area, or the diameter plus 2”, whichever is greater. 3-Point clearance must be installed in a triangular pattern around the proposed borehole and in a configuration not to allow for utilities to enter the borehole. 3-Point clearance must be 110% of the proposed intrusive area, or the diameter of the intrusive area plus 2”, whichever is greater. Each method of clearance should be documented on the Utility and Structure Checklist.

Manual clearing methods such as shoveling, using pick axes, digging bars and other hand tools should be avoided completely or only used when absolutely necessary and used with caution. Excessive down force, prying or use in poor/obstructed visibility conditions is prohibited as these tools can damage utilities.

Surface cover (e.g., asphalt) removal methods within the 30-inch Tolerance Zone that pose excessive down force such as Jackhammering should be used with extreme caution. Methods that only cut the surface cover (coring or saw cutting) present less risk due to the absence of the downward force which could cause collateral damage to shallow subsurface utilities. Note that utilities are often present at the concrete or pavement/soil interface or encased within the concrete or pavement and are easily damaged during concrete coring or pavement removal. Always work slowly, methodically and frequently STOP WORK to evaluate conditions during these work activities.

For borings and excavations, if the utility is known to be at depths where hand clearing is not feasible or creates additional safety concerns, no work will be performed within the 30 inch Tolerance Zone vertically or horizontally of the utility unless manual clearing is performed under the oversight of an Excavation Competent Person as defined in ARC HSCS005 ARCADIS Excavation and Trenching.

5.5.1 Temporary Backfilling of Pre-Cleared Boreholes

In some cases, it may be necessary to temporarily backfill a pre-cleared location until the remaining subsurface activities are performed. At these locations where subsurface intrusive work does not immediately follow pre-clearance, it is important to properly backfill and mark the pre-cleared location in order to relocate the pre-cleared location. In general, wooden stakes, survey markers, whiskers, paint marking or other surficial markings alone are inadequate because these markings can be easily removed, damaged or otherwise lost leading to uncertainty regarding the pre-cleared location. Although the specific steps for backfilling a pre-cleared location will depend on site specific conditions, use the following additional steps to prevent loss of the pre-cleared location:

- Backfill a pre-cleared location with clean sand or other granular material that is significantly different than the surrounding subsurface native material. Native soil should not be used to backfill a pre-cleared location that may require further subsurface work.
- Backfill the top 2 feet of a pre-cleared location with dyed sand or gravel to facilitate re-location.
- Use hammered wooden stakes or delineators to mark locations as an additional measure, if practical.
- In the event that the pre-cleared borehole is located on asphalt or concrete and an asphalt cold patch is required, use white paint to mark the intrusive location with a circle over the asphalt cold patch.
- In some instances, such as projects potentially affected by unexploded ordinance (UXO), the pre-cleared borehole may require that a PVC of matching diameter pipe be inserted into the pre-cleared borehole, filled with clean sand and affixed with a matching cap. Contact the project manager to identify any client-specific requirements.
- Always use a physical subsurface marker such as described above to identify the pre-cleared borehole location. Never rely solely on field measurements or GPS coordinates.
- If a utility or anomaly/obstruction is encountered during the pre-clearing process, backfill the hole with the native soil and mark the location with a pink painted X and/or NO.

In the event that a previously pre-cleared location cannot be located, the location must be re-cleared prior to performing subsurface intrusive work.

5.6 Acceptable Clearance for Working in Vicinity of Subsurface Utilities

Prior to the start of subsurface intrusive activities (i.e. excavations, vertical drilling, installing grounding rod, etc.), all utilities must be located and measures instituted to avoid subsurface utility hazards. Do not conduct subsurface work within 30 inches of a line marking in all directions. If the centerline of the utility is marked, the diameter of the utility or utility bank must be incorporated into the 30 inch Tolerance Zone, See Figure 1 located in Exhibit 2. If subsurface work must take place within the 30 inch Tolerance Zone of the line marking, the utility must be exposed (potholed) by soft dig / clearance methods prior to starting subsurface intrusive work (see Section 5.5 for options); **no mechanized equipment is permitted for the exposing of the utility**. Once the utility has been exposed, if mechanized equipment is planned for use within the 30 inch

Tolerance Zone of the utility, such activity must receive pre-approval by Corporate H&S, as necessary, to mitigate or accept the risk associated with the planned work. Additional excavation safety procedures may have to be developed as part of the approval to proceed. It should be noted that any disturbance within the 30 inches or disruption of the bedding materials could affect the integrity of the utility.

For horizontal borings, to avoid striking a utility, damage from vibration, damage by pressure of the advancing boring, do not drill within 30 inches in all directions (3D cylinder) a of a line marking. Make sure to factor the diameter of the line or utility bank when computing 30 inch Tolerance Zone. When crossing a utility during horizontal drilling it is recommend that the utility be exposed 30 inches in a 360° direction. When exposing utilities for horizontal borings the utility must be exposed (potholed) by soft dig / clearance methods. This recommendation applies even if the operating contractor has technology that places the location to within a few inches. Make sure to factor the diameter of the utility when determining the 30 inch Tolerance Zone. If subsurface work must take place within the 30 inch Tolerance Zone of the line marking, the utility must be exposed (potholed) by soft dig / clearance methods prior to starting subsurface intrusive work (see Section 5.5 for options); **no mechanized equipment is permitted for the exposing of the utility**. Once the utility has been exposed, if mechanized equipment is planned for use within the 30 inch Tolerance Zone of the utility, such activity must receive pre-approval by Corporate H&S, as necessary, to mitigate or accept the risk associated with the planned work. Additional excavation safety procedures may have to be developed as part of the approval to proceed. It should be noted that any disturbance within the 30 inches or disruption of the bedding materials could affect the integrity of the utility.

Additional cautions for horizontal borings include gravity utilities such as sewers and storm drains as the depth of these utilities will change (sometimes significantly) as they run across the project site. Always obtain the utility depth at the location where the boring will actually cross the line by collecting sewer depth inverts from identified manholes and interpolating those depths to the area of the subsurface intrusive work.

During well installations and well abandonment via mechanical equipment, the 30 inch Tolerance Zone rule applies outward from the outside edge of the largest diameter auger or tool to be used for installation and abandonment (over drilling). In cases where wells have been previously installed and the 30 inch rule has not been followed, work proposed using mechanized equipment to work within the 30 inch Tolerance Zone will require approval from Corporate H&S.

5.7 Acceptable Clearance for Working in Vicinity of Overhead Power Lines

No work will be performed by ARCADIS or our subcontractor near overhead power lines where any Unqualified Person or equipment is within the limits specified below, unless the power line has been properly covered or de-energized by the owner or operator of the power line. Qualified Person approach distances are defined in Exhibit 5A and 5B of ARC HSFS0006 Electrical Safety Standard.

Power Line Voltage Phase to phase (kV)	Minimum Safe Clearance (feet)
50 or below	10
Above 50 to 200	15
Above 200 to 350	20
Above 350 to 500	25
Above 500 to 750	35
Above 750 to 1,000	45

ANSI standard B30.5-1994, 5-3.4.5

5.7.1 Reducing Vehicle and Mechanical Equipment Clearance Requirements

Any vehicle or mechanical equipment capable of having parts of its structure elevated near energized overhead lines shall be operated so that a clearance of 10 ft. (305 cm) is maintained. If the voltage is higher than 50kV, the clearance shall be increased 4 in. (10 cm) for every 10kV over that voltage. However, under any of the following conditions, the clearance may be reduced:

- If the vehicle is in transit with its structure lowered, the clearance may be reduced to 4 ft. (122 cm). If the voltage is higher than 50kV, the clearance shall be increased 4 in. (10 cm) for every 10 kV over that voltage.

- If insulating barriers are installed to prevent contact with the lines, and if the barriers are rated for the voltage of the line being guarded and are not a part of or an attachment to the vehicle or its raised structure, the clearance may be reduced to a distance within the designed working dimensions of the insulating barrier.

- If the equipment is an aerial lift insulated for the voltage involved, and if the work is performed by a qualified person, the clearance (between the uninsulated portion of the aerial lift and the power line) may be reduced to the distance given in OSHA 1910.333(c)(3)(ii)(C) Table S-5. Reference information from OSHA 1910.333 Table S-5 and NFPA 70E Table 130.4(C)(a) for alternating-current systems and 130.4(C)(b) for the distances associated with direct-current voltage Systems is included as Exhibit 5 of ARC HSFS0006 Electrical Safety Standard.

Employees standing on the ground may not contact the vehicle or mechanical equipment or any of its attachments unless:

- The employee is using protective equipment rated for the voltage; or

- The equipment is located so that no uninsulated part of its structure (that portion of the structure that provides a conductive path to employees on the ground) can come closer to the line than permitted in this section of this standard.

If any vehicle or mechanical equipment capable of having parts of its structure elevated near energized overhead lines is intentionally grounded, employees working on the ground near the point of grounding may not stand at the grounding location whenever there is a possibility of overhead line contact. Additional precautions, such as the use of barricades or insulation, shall be taken to protect employees from hazardous ground potentials, depending on earth resistivity and fault currents, which can develop within the first few feet or more outward from the grounding point.

When a machine is in contact with an overhead power line, do not allow anyone to come near or touch the machine. Stay away from the machine and summon outside assistance.

5.8 Reporting Utility Incidents

ARCADIS field personnel involved with any subsurface, submarine, and above-ground utility strikes should immediately STOP WORK and contact the Project Manager to discuss the incident. The utility strike must be reported to Corporate Health and Safety and Legal Departments immediately, and no later than 24 hours. Use the Utility Line Strike Investigation Form as part of the notification process.

Selected utility strike incidents may also utilize a conference call with operations management to review findings and lessons learned. The Divisional Health and Safety Director will make the determination concerning the need to have the incident review call, and will arrange the call, if deemed necessary.

5.9 Relationship of this standard to the Project Specific HASP

With the exception of the Utility and Structures Checklist, this standard, including most supplements, are not designed to be printed off and attached to project HASPs. During project health and safety planning, this standard will be reviewed and applicable clearance technologies and methods will be documented on the Utility and Structures Checklist.

Additionally, emergency action standards specific to utility strikes should be addressed. ARC HSFS-019 Supplement 5 provides general guidelines for emergency response to utility strikes. Applicable information may be attached to the Utility and Structures Checklist to facilitate communication of response expectations.

5.10 Required Contract Terms and Conditions

ARCADIS' standard client and subcontractor contracts contain required terms and conditions defining responsibility for utility clearance and the allocation of risk associated with an impacted utility. These terms and conditions have prescribed language concerning subsurface work that is presented in ARCADIS client contracts and ARCADIS subcontractor contracts, which can be found on the Legal Source site. If such provisions cannot be agreed upon, the reasons are documented and other risk-management actions should be identified, such as limits of liability, add additional physical investigations, additional lines of evidence or utility location, assignment of risk to subcontractors, etc. In addition, any changes to these terms and conditions require approval by Legal Services.

6. TRAINING

Employees responsible for coordinating or conducting utility clearance activities will be familiar with the requirements of this standard. ARCADIS in-house 8-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) refresher provides awareness-level training regarding this utility location and clearance standard.

8. RECORDS

8.1 Utility Clearance Records

All records (maps, checklists and documentation of communications) used to determine the location of utilities should be retained and kept in the project file.

9. APPROVALS AND HISTORY OF CHANGE

Approved By: Tony Tremblay, CSP – Corporate H&S, Director of Technical Programs

History of Change

Revision Date	Revision Number	Standard Developer or Revised By / Approver	Reason for change
13 December 2006	01	Mike Thomas/Pat Vollertsen	Original document
26 March 2007	02	Mike Thomas/Pat Vollertsen	Put in new company format
15 May 2007	03	Mike Thomas/Pat Vollertsen	Added nation-wide 811 number
6 September 2007	04	Mike Thomas/Pat Vollertsen	Changing over to new template format
22 February 2008	05	Mija Coppola	Changing over to new template format
13 January 2009	06	Mija Coppola	Define lines of evidence
4 October 2010	07	Sam Moyers/Mija Coppola	Reformatting and addition of utility clearance information
13 February 2012	08	Sam Moyers/Mija Coppola	Modified link information for utility strike reporting, clarified local/state requirements in section 4.1 and 4.3
28 January 2013	09	Tony Tremblay	Utility and Structures Checklist revised; hyperlink updated
12 February 2013	10	Amanda Tine/Tony Tremblay	Clarified clearance boundaries for Unqualified staff in Section 5.7 and added information about vehicles and equipment being used near power lines in Section 5.7.1

Revision Date	Revision Number	Standard Developer or Revised By / Approver	Reason for change
15 March 2013	11	Kurt Merkle, Rebecca Lindeman / Tony Tremblay	Added additional text to standard for recent lessons learned, added section 5.4 (Locating Technologies) and 5.5 (Clearance Methodologies), added additional details to section 5.6 when working in close proximity to subsurface utilities, and added Supplement 6 - Utility Location SOP for Aquatic Work Activities.
07 July 2013	12	Andrew McDonald/ Tony Tremblay	Removed HSFS-019 Supplement 1, Utility Definitions. Added hyperlink for One-Call and State Law Directory. Segregated evidence of sewer or storm drains in USC list. Removed Sam Moyers and added Andrew McDonald as author.
26 September 2014	13	Andrew McDonald/Tony Tremblay	Added Exhibit 1. Definitions and 30 inch tolerance zone. Clarified use of 811 or state one call as a reliable line of evidence. Added best practice to cover backfilling of pre-cleared boreholes. Updated USC list to cover soft dig termination depths and PM review.
23 February 2015	14	Tony Tremblay	Page number correction

EXHIBIT 1 – DEFINITIONS

Above Ground Utilities - For the purpose of this procedure, above ground utilities include, but are not limited to: any above ground line, pipe, conduit, system, or facility used for producing, storing, conveying, transmitting or distributing communication or telecommunications signals, electricity, gas, liquid, petroleum and petroleum products, coal slurry, hazardous liquids or gases, water under pressure, steam, sanitary sewage, storm water, or other materials, liquids, or gases.

Subsurface Utilities - For the purposes of this procedure, subsurface utilities include, but are not limited to: any underground line, pipe, conduit, system, or facility used for producing, storing, conveying, transmitting or distributing communication or telecommunications signals, electricity, gas, liquid, petroleum and petroleum products, coal slurry, hazardous liquids or gases, water under pressure, steam, storm water, or sanitary sewage; underground storage tanks; tunnels and cisterns; and septic tanks and lines.

Tolerance Zone – The area within 30 inches in all directions from the outside diameter of a located/marked utility in which special care is to be taken. If the centerline of the utility is marked, the diameter of the utility or utility bank must be incorporated into the 30 inches. This area must be hand cleared with non-mechanized equipment. Once the utility has been exposed, if mechanized equipment is planned for use within the 30 inch Tolerance Zone of the utility, such activity must receive pre-approval by Corporate H&S, to mitigate or accept the risk associated with the planned work. See Figure 1 – 30” Tolerance Zone.

Field Log Book Entries

Rev. #: 0

Rev Date: 11 August 2009

Approval Signatures

Prepared by: Andrew Kanik Date: 8/11/09

Reviewed by: Michael J. Hefflich Date: 8/11/09
(Technical Expert)

I. Scope and Application

This ARCADIS Standard Operating Procedure covers the entries needed in a field log book for environmental investigations.

This SOP does not address all of the entries that may be needed for a specific project, and does not address health and safety, equipment decontamination, field parameter measurements, sample preservation, chain-of-custody, or laboratory analysis. For direction on requirements in these areas, refer to other ARCADIS SOPs, the project work plans including the quality assurance project plan, sampling plan, and health and safety plan, as appropriate.

II. Personnel Qualifications

ARCADIS personnel participating in fieldwork and making entries into the field log book should have a minimum of one (1) year of field experience (or be under the supervision and accompanied in the field by someone who does) and current health and safety training including 40-hour HAZWOPER training, site supervisor training, site-specific training, first aid, and CPR, as needed. Field personnel will also be compliant with client-specific training requirements. In addition, ARCADIS field sampling personnel will be versed in the relevant SOPs and posses the required skills and experience necessary to successfully complete the desired field work.

III. Equipment List

- Field Log Book
- Ball point (medium point) pen with blue or black ink (black preferred). A fine point Sharpie pen may be used if the ink does not bleed through the page and become visible on back side of the page. If weather conditions prevent the use of a pen, indicate so in the log and use an alternate writing instrument .
- Zip-lock baggie or other weather-proof container to protect the field log book from the elements.

IV. Cautions

All entries in the field log must be legible and archivable. Do not leave the field log book exposed to the elements or other conditions that might moisten the pages and smear/dissolve the entries. When not in the field, the log book should be stored in a location that is easily accessible to field crews.

V. Health and Safety Considerations

ARCADIS field personnel will be familiar and compliant with Client-specific health and safety requirements.

VI. Procedure

- Print legibly. Do not use cursive writing.
- The name of the project, project number and project location should be written in indelible ink on the outside of the field log book.
- On the inside of the front cover, write "If Found, Please Return to ARCADIS" and include the appropriate address and phone number, the name of the person to which the book is assigned, and the name of the project manager.
- Reserve the first page of the book for a Table of Contents.
- Reserve the last five (5) pages of the book for important contacts, notes, reminders, etc.
- Each day of field work, the following should be recorded in the field log book as applicable:

    a) Project Name

    b) Date and time arrived

    c) Work Site Location

    d) Names of people on-site related to the project including ARCADIS employees, visitors, subcontractor employees, agency personnel, client representative, etc.

    e) Describe the work to be performed briefly, and list the equipment on-site

    f) Indicate the health and safety (H&S) level to be used

    g) Record instrument calibrations and checks

    h) Record time and general content of H&S briefing

    i) Describe the weather conditions, including temperature, precipitation, and wind speed and direction

    j) List periodic time entries in the far left hand column of each page

    k) Minimize unused space on each page

- The tailgate meeting must be recorded in the log book and the tailgate form completed. If H&S monitoring is performed, record the time and results of initial and followup monitoring.

- Note factual observations including collection of QA/QC samples, delays, well damage, accidents, work plan deviations, instrument problems, and problem resolutions.
- Describe work performed and how documented such as photographs, sample core logs, water sampling logs, etc.
- Describe bases for field decisions including pertinent conversations with visitors, regulators, or project personnel.
- Note final instrument calibrations and checks.
- Sign the log book at the end of each day at a minimum. Draw a line to the end of the page to indicate no further entries on that page. Sign the bottom of each page if possible.
- If an entry to the log book is changed, strike out the deleted text or item with a single line such that the entry remains legible, and initial and date the change. Such changes should only be made by the same person that made the initial entry.
- Field log book entries must be made in the field at the site, not at a later time at a different location. Supplemental entries to the log book may be made at a later date. The supplemental entry must be clearly identified as such and the entry must be signed and dated as described in this SOP.
- Problems noted in the field log book must be brought to the attention of the project manager and task manager in a timely fashion. Problems may be reported in person, on the telephone, or in a written daily log form. If daily logs are prepared and you will not be able to personally give the daily log to the project manager, send the daily log via FAX or overnight courier to the project manager and task manager.

VII. Waste Management

Investigation-derived waste will be managed as described in the Investigation-Derived Waste Handling and Storage SOP. A drum/waste inventory should be maintained on a pre-designated page in the field log book.

VIII. Data Recording and Management

Each page of the field log book should be scanned for electronic/digital archiving at periodic intervals. This will ensure that copies of the field notes are available in the event the field book is lost or damaged, and that field data can be easily disseminated to others without the risk of physically sending the field log book. Field log books that are full should be archived with the project files, and readily retrievable.

IX. Quality Assurance

Be mindful that the field log book may be produced in court. All entries should be legible (as discussed above). Entries should also be in English, unless working in a country where English is not the predominant language or you are directed otherwise by the project manager.

Soil Description

Rev. #: 0

Rev Date: May 20, 2008

Approval Signatures

Prepared by: Date: 5/22/08

Reviewed by:  Date: 5/22/08

(Technical Expert)

I. Scope and Application

This ARCADIS standard operating procedure (SOP) describes proper soil description procedures. This SOP should be followed for all unconsolidated material unless there is an established client-required specific SOP or regulatory-required specific SOP. In cases where there is a required specific SOP, it should be followed and should be referenced and/or provided as an appendix to reports that include soil classifications and/or boring logs. When following a required non-ARCADIS SOP, additional information required by this SOP should be included in field notes with client approval.

This SOP has been developed to emphasize field observation and documentation of details required to:

- make hydrostratigraphic interpretations guided by depositional environment/geologic settings;
- provide information needed to understand the distribution of constituents of concern; properly design wells, piezometers, and/or additional field investigations; and develop appropriate remedial strategies.

This SOP incorporates elements from various standard systems such as ASTM D2488-06, Unified Soil Classification System, Burmister and Wentworth. However, none of these standard systems focus specifically on contaminant hydrogeology and remedial design. Therefore, although each of these systems contain valuable guidance and information related to correct descriptions, strict application of these systems can omit information critical to our clients and the projects that we perform.

This SOP does not address details of health and safety; drilling method selection; boring log preparation; sample collection; or laboratory analysis. Refer to other ARCADIS SOPS, the project work plans including the quality assurance project plan, sampling plan, and health and safety plan (HASP), as appropriate.

II. Personnel Qualifications

Soil descriptions will be completed only by persons who have been trained in ARCADIS soil description procedures. Field personnel will complete training on the ARCADIS soil description SOP in the office and/or in the field under the guidance of an experienced field geologist. For sites where soil descriptions have not previously been well documented, soil descriptions should be performed only by trained persons with a degree in geology or a geology-related discipline.

III. Equipment List

The following equipment should be taken to the field to facilitate soil descriptions:

- field book, field forms or PDA to record soil descriptions;
- field book for supplemental notes;
- this SOP for Soil Descriptions and any project-specific SOP (if required);
- field card showing Wentworth scale;
- Munsell® soil color chart;
- tape measure divided into tenths of a foot;
- stainless steel knife or spatula;
- hand lens;
- water squirt bottle;
- jar with lid;
- personal protective equipment (PPE), as required by the HASP; and
- digital camera.

IV. Cautions

Drilling and drilling-related hazards including subsurface utilities are discussed in other SOPs and site-specific HASPs and are not discussed herein.

Soil samples may contain hazardous substances that can result in exposure to persons describing soils. Routes for exposure may include dermal contact, inhalation and ingestion. Refer to the project specific HASP for guidance in these situations.

V. Health and Safety Considerations

Field activities associated with soil sampling and description will be performed in accordance with a site-specific HASP, a copy of which will be present on site during such activities. Know what hazardous substances may be present in the soil and understand their hazards. Always avoid the temptation to touch soils with bare hands, detect odors by placing soils close to your nose, or tasting soils.

VI. Procedure

1. Select the appropriate sampling method to obtain representative samples in accordance with the selected sub-surface exploration method, e.g. split-spoon or Shelby sample for hollow-stem drilling, Lexan or acetate sleeves for dual-tube direct push, etc.

2. Proceed with field activities in required sequence. Although completion of soil descriptions is often not the first activity after opening sampler, identification of stratigraphic changes is often necessary to select appropriate intervals for field screening and/or selection of laboratory samples.

3. Examine all of each individual soil sample (this is different than examining each sample selected for laboratory analysis), and record the following for each stratum:

- depth interval;
- principal component with descriptors, as appropriate;
- amount and identification of minor component(s) with descriptors as appropriate;
- moisture;
- consistency/density;
- color; and
- additional description or comments (recorded as notes).

The above is described more fully below.

DEPTH

To measure and record the depth below ground level (bgl) of top and bottom of each stratum, the following information should be recorded.

1. Measured depth to the top and bottom of sampled interval. Use starting depth of sample based upon measured tool length information and the length of sample interval.

2. Length of sample recovered, not including slough (material that has fallen into hole from previous interval), expressed as fraction with length of recovered sample as numerator over length of sampled interval as denominator (e.g. 14/24 for 14 inches recovered from 24-inch sampling interval that had 2 inches of slough discarded).

3. Thickness of each stratum measured sequentially from the top of recovery to the bottom of recovery.

4. Any observations of sample condition or drilling activity that would help identify whether there was loss from the top of the sampling interval, loss from the bottom of the sampling interval, or compression of the sampling interval. Examples: 14/24, gravel in nose of spoon; or 10/18 bottom 6 inches of spoon empty.

DETERMINATION OF COMPONENTS

Obtain a representative sample of soil from a single stratum. If multiple strata are present in a single sample interval, each stratum should be described separately. More specifically, if the sample is from a 2-foot long split-spoon where strata of coarse sand, fine sand and clay are present, then the resultant description should be of the three individual strata unless a combined description can clearly describe the interbedded nature of the three strata. Example: Fine Sand with interbedded lenses of Silt and Clay, ranging between 1 and 3 inches thick.

Identify principal component and express volume estimates for minor components on logs using the following standard modifiers.

Modifier	Percent of Total Sample (by volume)
and	36 - 50
some	21 - 35
little	10 - 20
trace	<10

Determination of components is based on using the Udden-Wentworth particle size classification (see below) and measurement of the average grain size diameter. Each size grade or class differs from the next larger grade or class by a constant ratio of ½. Due to visual limitations, the finer classifications of Wentworth's scale cannot be distinguished in the field and the subgroups are not included. Visual determinations in the field should be made carefully by comparing the sample to the field gauge card that shows Udden-Wentworth scale or by measuring with a ruler. Use of field sieves s

recommended to assist in estimating percentage of coarse grain sizes. Settling test or wash method (Appendix X4 of ASTM D2488) is recommended for determining presence and estimating percentage of clay and silt.

Udden-Wenworth Scale Modified ARCADIS, 2008			
Size Class	Millimeters	Inches	Standard Sieve #
Boulder	256 – 4096	10.08+	
Large cobble	128 - 256	5.04 -10.08	
Small cobble	64 - 128	2.52 – 5.04	
Very large pebble	32 – 64	0.16 - 2.52	
Large pebble	16 – 32	0.63 – 1.26	
Medium pebble	8 – 16	0.31 – 0.63	
Small pebble	4 – 8	0.16 – 0.31	No. 5 +
Granule	2 – 4	0.08 – 0.16	No.5 – No.10
Very coarse sand	1 -2	0.04 – 0.08	No.10 – No.18
Coarse sand	½ - 1	0.02 – 0.04	No.18 - No.35
Medium sand	¼ - ½	0.01 – 0.02	No.35 - No.60
Fine sand	1/8 -¼	0.005 – 0.1	No.60 - No.120
Very fine sand	1/16 – 1/8	0.002 – 0.005	No. 120 – No. 230
Silt (subgroups not included)	1/256 – 1/16	0.0002 – 0.002	Not applicable (analyze by pipette or hydrometer)
Clay (subgroups not included	1/2048 – 1/256	.00002 – 0.0002	

Identify components as follows. Remove particles greater than very large pebbles (64-mm diameter) from the soil sample. Record the volume estimate of the greater than very large pebbles. Examine the sample fraction of very large pebbles and smaller particles and estimate the volume percentage of the pebbles, granules, sand, silt and clay. Use the jar method, visual method, and/or wash method (Appendix X4 of ASTM D2488) to estimate the volume percentages of each category.

Determination of actual dry weight of each Udden-Wentworth fraction requires laboratory grain-size analysis using sieve sizes corresponding to Udden-Wentworth fractions and is highly recommended to determine grain-size distributions for each hydrostratigraphic unit.

Lab or field sieve analysis is advisable to characterize the variability and facies trends within each hydrostratigraphic unit. Field sieve-analysis can be performed on selected samples to estimate dry weight fraction of each category using ASTM D2488 Standard Practice for Classification of Soils for Engineering Purposes as guidance, but replace required sieve sizes with the following Udden-Wentworth set: U.S. Standard sieve mesh sizes 6; 12; 20; 40; 70; 140; and 270 to retain pebbles; granules; very coarse sand; coarse sand; medium sand; fine sand; and very fine sand, respectively.

PRINCIPAL COMPONENT

The principal component is the size fraction or range of size fractions containing the majority of the volume. Examples: the principal component in a sample that contained 55% pebbles would be “Pebbles”; or the principal component in a sample that was 20% fine sand, 30% medium sand and 25% coarse sand would be “Fine to coarse Sand” or for a sample that was 40% silt and 45% clay the principal component would be “Clay and Silt”.

Include appropriate descriptors with the principal component. These descriptors vary for different particle sizes as follows.

Angularity – Describe the angularity for very coarse sand and larger particles in accordance with the table below (ASTM D-2488-06). Figures showing examples of angularity are available in ASTM D-2488-06 and the ARCADIS Soil Description Field Guide.

Description	Criteria
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

Plasticity – Describe the plasticity for silt and clay based on observations made during the following test method (ASTM D-2488-06).

- As in the dilatancy test below, select enough material to mold into a ball about ½ inch (12 mm) in diameter. Mold the material, adding water if necessary, until it has a soft, but not sticky, consistency.

- Shape the test specimen into an elongated pat and roll by hand on a smooth surface or between the palms into a thread about 1/8 inch (3 mm) in diameter. (If the sample is too wet to roll easily, it should be spread into a thin layer and allowed to lose some water by evaporation.) Fold the sample threads and reroll repeatedly until the thread crumbles at a diameter of about 1/8 inch. The thread will crumble when the soil is near the plastic limit.

Description	Criteria
Nonplastic	A $^{1}/_{8}$ inch (3 mm) thread cannot be rolled at any water content.
Low	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit

Dilatancy – Describe the dilatancy for silt and silt-sand mixtures using the following field test method (ASTM D-2488-06).

- From the specimen select enough material to mold into a ball about ½ inch (12 mm) in diameter. Mold the material adding water if necessary, until it has a soft, but not sticky, consistency.
- Smooth the ball in the palm of one hand with a small spatula.
- Shake horizontally, striking the side of the hand vigorously with the other hand several times.
- Note the reaction of water appearing on the surface of the soil.
- Squeeze the sample by closing the hand or pinching the soil between the fingers, and not the reaction as none, slow, or rapid in accordance with the table below. The reaction is the speed with which water appears while shaking and disappears while squeezing.

Description	Criteria
None	No visible change in the specimen.
Slow	Water appears slowly on the surface of the specimen during shaking and does not disappear or disappears slowly upon squeezing.
Rapid	Water appears quickly on the surface of the specimen during shaking and disappears quickly upon squeezing.

MINOR COMPONENT(S)

The minor component(s) are the size fraction(s) containing less than 50% volume. Example: the identified components are estimated to be 60% medium sand to granules, 25 % silt and clay; 15 % pebbles – there are two identified minor components: silt and clay; and pebbles.

Include a standard modifier to indicate percentage of minor components (see Table on Page 5) and the same descriptors that would be used for a principal component. Plasticity should be provided as a descriptor for the silt and clay. Dilatancy should be provided for silt and silt-sand mixtures. Angularity should be provided as a descriptor for pebbles and coarse sand. For the example above, the minor constituents with

modifiers could be: some silt and clay, low plasticity; little medium to large pebbles, sub-round.

SORTING

Sorting is the opposite of grading, which is a commonly used term in the USCS or ASTM methods to describe the uniformity of the particle size distribution in a sample. Well-sorted samples are poorly graded and poorly sorted samples are well graded. ARCADIS prefers the use of sorting for particle size distributions and grading to describe particle size distribution trends in the vertical profile of a sample or hydrostratigraphic unit because of the relationship between sorting and the energy of the depositional process. For soils with sand-sized or larger particles, sorting should be determined as follows:

- Well sorted – the range of particle sizes is limited (e.g. the sample is comprised of predominantly one or two grain sizes)
- Poorly sorted – a wide range of particle sizes are present

You can also use sieve analysis to estimate sorting from a sedimentological perspective; sorting is the statistical equivalent of standard deviation. Smaller standard deviations correspond to higher degree of sorting (see Remediation Hydraulics, 2008).

MOISTURE

Moisture content should be described for every sample since increases or decreases in water content is critical information. Moisture should be described in accordance with the table below (percentages should not be used unless determined in the laboratory).

Description	Criteria
Dry	Absence of moisture, dry to touch, dusty.
Moist	Damp but no visible water.
Wet (Saturated)	Visible free water, soil is usually below the water table.

CONSISTENCY or DENSITY

This can be determined by standard penetration test (SPT) blow counts (ASTM D-1586) or field tests in accordance with the tables below. For SPT blow counts the N-value is used. The N-value is the blows per foot for the 6" to 18" interval. Example: for 24-inch spoon, recorded blows per 6-inch interval are: 4/6/9/22. Since the second interval is 6" to12", the third interval is 12" to 18", the N value is 6+9, or 15. Fifty blow counts for less than 6 inches is considered refusal.

Fine-grained soil – Consistency

Description	Criteria
Very soft	N-value < 2 or easily penetrated several inches by thumb.
Soft	N-value 2-4 or easily penetrated one inch by thumb.
Medium stiff	N-value 9-15 or indented about ¼ inch by thumb with great effort.
Very stiff	N-value 16-30 or readily indented by thumb nail.
Hard	N-value > than 30 or indented by thumbnail with difficulty

Coarse-grained soil – Density

Description	Criteria
Very loose	N-value 1- 4
Loose	N-value 5-10
Medium dense	N-value 11-30
Dense	N-value 31- 50
Very dense	N-value >50

COLOR

Color should be described using simple basic terminology and modifiers based on the Munsell system. Munsell alpha-numeric codes are required for all samples. If the sample contains layers or patches of varying colors this should be noted and all representative colors should be described. The colors should be described for moist

samples. If the sample is dry it should be wetted prior to comparing the sample to the Munsell chart.

ADDITIONAL COMMENTS (NOTES)

Additional comments should be made where observed and should be presented as notes with reference to a specific depth interval(s) to which they apply. Some of the significant information that may be observed includes the following.

- **Odor** - You should not make an effort to smell samples by placing near your nose since this can result in unnecessary exposure to hazardous materials. However, odors should be noted if they are detected during the normal sampling procedures. Odors should be based upon descriptors such as those used in NIOSH "Pocket Guide to Chemical Hazards", e.g. "pungent" or "sweet" and should not indicate specific chemicals such as "phenol-like" odor or "BTEX" odor.
- Structure
- Bedding planes (laminated, banded, geologic contacts)
- Presence of roots, root holes, organic material, man-made materials, minerals, etc.
- Mineralogy
- Cementation
- NAPL presence/characteristics, including sheen (based on client-specific guidance)
- Reaction with HCl (typically used only for special soil conditions)
- Origin, if known (capital letters: LACUSTRINE; FILL; etc.)

EXAMPLE DESCRIPTIONS

51.4 to 54.0' Clay, some silt, medium to high plasticity; trace small to large pebbles, subround to subangular up to 2" diameter; moist; stiff; dark grayish brown (10YR 4/2) NOTE: Lacustrine; laminated 0.01 to 0.02 feet thick, laminations brownish yellow (10 YR 4/3).

32.5 to 38.0' Sand, medium to Pebbles, coarse; sub-round to sub-angular; trace silt; poorly sorted; wet; grayish brown (10YR5/2). NOTE: sedimentary, igneous and metamorphic particles.

Unlike the first example where a density of cohesive soils could be estimated, this rotosonic sand and pebble sample was disturbed during drilling (due to vibrations in a loose Sand and Pebble matrix) so no density description could be provided. Neither sample had noticeable odor so odor comments were not included.

The standard generic description order is presented below.

- Depth

- Principal Components
    - Angularity for very coarse sand and larger particles
    - Plasticity for silt and clay
    - Dilatancy for silt and silt-sand mixtures
- Minor Components
- Sorting
- Moisture
- Consistency or Density
- Color
- Additional Comments

VII. Waste Management

Project-specific requirements should be identified and followed. The following procedures, or similar waste management procedures are generally required.

Water generated during cleaning procedures will be collected and contained onsite in appropriate containers for future analysis and appropriate disposal. PPE (such as gloves, disposable clothing, and other disposable equipment) resulting from personnel cleaning procedures and soil sampling/handling activities will be placed in plastic bags. These bags will be transferred into appropriately labeled 55-gallon drums or a covered roll-off box for appropriate disposal.

Soil materials will be placed in sealed 55-gallon steel drums or covered roll-off boxes and stored in a secured area. Once full, the material will be analyzed to determine the appropriate disposal method.

VIII. Data Recording and Management

Upon collection of soil samples, the soil sample should be logged on a standard boring log and/or in the field log book depending on Data Quality Objectives (DQOs) for the task/project. Two examples of standard boring logs are presented below.

The general scheme for soil logging entries is presented above; however, depending on task/project DQOs, specific logging entries that are not applicable to task/project goals may be omitted at the project manager's discretion. In any case, use of a consistent logging procedure is required.

Completed logs and/or logbook will be maintained in the task/project field records file. Digital photographs of typical soil types observed at the site and any unusual features should be obtained whenever possible. All photographs should include a ruler or common object for scale. Photo location, depth and orientation must be recorded in the daily log or log book and a label showing this information in the photo is useful.

IX. Quality Assurance

Soil descriptions should be completed only by appropriately trained personnel. Descriptions should be reviewed by an experienced field geologist for content, format and consistency. Edited boring logs should be reviewed by the original author to assure that content has not changed.

Soil Drilling and Sample Collection

Rev. #: 3

Rev Date: September 26, 2014

Approval Signatures

Prepared by: _____ Date: 03/08/2011

Reviewed by: _____ Date: 03/08/2011
(Technical Expert)

Reviewed by: _____ Date: 09/26/2014
(Eric Killenbeck)

I. Scope and Application

Overburden drilling is commonly performed using the hollow-stem auger drilling method. Other drilling methods suitable for overburden drilling, which are sometimes necessary due to site-specific geologic conditions, include: drive-and-wash, spun casing, Rotasonic, dual-rotary (Barber Rig), and fluid/mud rotary. Direct-push techniques (e.g., Geoprobe or cone penetrometer) may also be used. The drilling method to be used at a given site will be selected based on site-specific consideration of anticipated drilling depths, site or regional geologic knowledge, types of sampling to be conducted, required sample quality and volume, and cost.

No oils or grease will be used on equipment introduced into the boring (e.g., drill rod, casing, or sampling tools).

II. Personnel Qualifications

The Project Manager (a qualified geologist, environmental scientist, or engineer) will identify the appropriate soil boring locations, depth and soil sample intervals in a written plan.

Personnel responsible for overseeing drilling operations must have at least 16 hours of prior training overseeing drilling activities with an experienced geologist, environmental scientist, or engineer with at least 2 years of prior experience.

III. Equipment List

The following materials will be available during soil boring and sampling activities, as required:

- Site Plan with proposed soil boring/well locations;
- Work Plan or Field Sampling Plan (FSP), and site Health and Safety Plan (HASP);
- personal protective equipment (PPE), as required by the HASP;
- drilling equipment required by the American Society for Testing and Materials (ASTM) D 1586, when performing split-spoon sampling;
- disposable plastic liners, when drilling with direct-push equipment;
- appropriate soil sampling equipment (e.g., stainless steel spatulas, knife);

- equipment cleaning materials;
- appropriate sample containers and labels;
- chain-of-custody forms;
- insulated coolers with ice, when collecting samples requiring preservation by chilling;
- photoionization detector (PID) or flame ionization detector (FID); and
- field notebook and/or personal digital assistant (PDA).

IV. Cautions

Prior to beginning field work, the ARCADIS utility policy must be review and implemented. The ARCADIS utility location policy is outlined on the Health and Safety Team Site (http://apex/HS/Pages/default.aspx).

Avoid using drilling fluids or materials that could impact groundwater or soil quality, or could be incompatible with the subsurface conditions or a remediation design. The quality of water used for drilling should also be taken into consideration.

Water used for drilling and sampling of soil or bedrock, decontamination of drilling/sampling equipment, or grouting boreholes upon completion will be of a quality acceptable for project objectives. Testing of water supply should be considered.

Specifications of materials used for backfilling of a bore hole will be obtained, reviewed and approved to meet state and/or federal requirements, as well as project quality objectives.

V. Health and Safety Considerations

Field activities associated with drilling will be performed in accordance with a site-specific Health and Safety Plan (HASP), a copy of which will be present on site during such activities.

VI. Procedure

Drilling Procedures

The drilling contractor will be responsible for obtaining accurate and representative samples; informing the supervising geologist of changes in drilling pressure; and keeping a separate general log of soils encountered, including blow counts (i.e., the number of blows from a soil sampling drive weight [140 pounds] required to drive the split-barrel sampler in 6-inch increments). The term "samples" means soil materials from particular depth intervals, whether or not portions of these materials are submitted for laboratory analysis. Records will also be kept of occurrences of premature refusal due to boulders or construction materials that may have been used as fill. Where a boring cannot be advanced to the desired depth, the boring will be abandoned and an additional boring will be advanced at an adjacent location to obtain the required sample. Where it is desirable to avoid leaving vertical connections between depth intervals, the borehole will be sealed using cement and/or bentonite. Multiple refusals may lead to a decision by the supervising geologist to abandon that sampling location.

Soil Characterization Procedures

Soils encountered while drilling soil borings will be collected using one of the following methods:

- 2-inch split-barrel (split-spoon) sampler, if using the ASTM D 1586 - Standard Test Method for Penetration Test and Split-Barrel Sampling of Soils
- Plastic internal soil sample sleeves if using direct-push drilling.

Soils are typically field screened with an FID or PID at sites where volatile organic compounds are present in the subsurface. Field screening is performed using one of the following methods:

- Upon opening the sampler, the soil is split open and the PID or FID probe is placed in the opening and covered with a gloved hand. Such readings should be obtained at several locations along the length of the sample
- A portion of the collected soil is placed in a jar, which is covered with aluminum foil, sealed, and allowed to warm to room temperature. After warming, the cover is removed, the foil is pieced with the FID or PID probe, and a reading is obtained.

Samples selected for laboratory analysis will be handled, packed, and shipped in accordance with the procedures outlined in the Work Plan, FSP, or Chain-of-Custody, Handling, Packing, and Shipping SOP.

A geologist will be onsite during drilling and sampling operations to describe each soil interval on the soil boring log, including:

- percent recovery;
- structure and degree of sample disturbance;
- soil type;
- color;
- moisture condition;
- density;
- grain-size;
- consistency; and
- other observations, particularly relating to the presence of waste materials

Further details regarding geologic description of soils are presented in the Soil Description SOP.

Particular care will be taken to fully describe any sheens observed, oil saturation, staining, discoloration, evidence of chemical impacts, or unnatural materials.

VII. Waste Management

Water generated during cleaning procedures will be collected and contained onsite in appropriate containers for future analysis and appropriate disposal.

PPE (such as gloves, disposable clothing, and other disposable equipment) resulting from personnel cleaning procedures and soil sampling/handling activities will be placed in plastic bags. These bags will be transferred into appropriately labeled 55-gallon drums or a covered roll-off box for appropriate disposal.

Soil materials will be placed in sealed 55-gallon steel drums or covered roll-off boxes and stored in a secured area. Once full, the material will be analyzed to determine the appropriate disposal method.

VIII. Data Recording and Management

The supervising geologist or scientist will be responsible for documenting drilling events using a bound field notebook and/or PDA to record all relevant information in a clear and concise format. The record of drilling events will include:

- start and finish dates of drilling;
- name and location of project;
- project number, client, and site location;
- sample number and depths;
- blow counts and recovery;
- depth to water;
- type of drilling method;
- drilling equipment specifications, including the diameter of drilling tools;
- documentation of any elevated organic vapor readings;
- names of drillers, inspectors, or other people onsite; and
- weather conditions.

IX. Quality Assurance

Equipment will be cleaned prior to use onsite, between each drilling location, and prior to leaving the site. Drilling equipment and associated tools, including augers, drill rods, sampling equipment, wrenches, and other equipment or tools that may have come in contact with soils and/or waste materials will be cleaned with high-pressure steam-cleaning equipment using a potable water source. The drilling equipment will be cleaned in an area designated by the supervising engineer or geologist that is located outside of the work zone. More elaborate cleaning procedures may be required for reusable soil samplers (split-spoons) when soil samples are obtained for laboratory analysis of chemical constituents.

Water Level Measurement

Rev. #: 2

Rev Date: February 24, 2011

Approval Signatures

Prepared by: Date: 02/24/2011

Reviewed by: Date: 02/24/2011

(Technical Expert)

I. Scope and Application

The objective of this Standard Operating Procedure (SOP) is to describe procedures to measure and record groundwater and surface-water elevations. Water levels may be measured using an electronic water-level probe, oil-water level indicator, or a pressure transducer from established reference points (e.g. top of casing). Reference points will be surveyed to evaluate fluid elevations relative to mean sea level (msl). This SOP describes the equipment, field procedures, materials, and documentation procedures to measure and record groundwater and surface-water elevations using the aforementioned equipment.

This is a standard (i.e., typically applicable) operating procedure which may be varied or changed as required, dependent upon site conditions, equipment limitations, or limitations imposed by the procedure. The ultimate procedure employed will be documented in the project work plans or reports.

II. Personnel Qualifications

ARCADIS field sampling personnel will have current health and safety training including 40-hour HAZWOPER training, site supervisor training, site-specific training, first aid, and CPR, as needed. In addition, ARCADIS field sampling personnel will be versed in the relevant SOPs and posses the required skills and experience necessary to successfully complete the desired field work.

III. Equipment List

The following materials, as required, shall be available during water level measurements:

- Appropriate personal protective equipment as specified in the Site Health and Safety Plan
- Equipment decontamination supplies
- Electronic water-level indicator
- Electronic oil-water level indicator
- Mini-Troll® or Troll® pressure transducer
- In-Situ™ data logger

- Laptop computer with the Win-Situ software package installed
- Photoionization detector (PID) and/or organic vapor analyzer
- Non-phosphate laboratory soap (Alconox or equivalent)
- Deionized/distilled water
- 150-foot measuring tape
- Solvent (methanol/acetone) rinse
- Portable containers
- Hacksaw
- Pliers
- Plastic sheeting
- “Write-in-the-Rain” Field logbook and or PDA (Personal Digital Assistant)
- Indelible ink pen.

IV. Cautions

Electronic water-level probes and oil-water interface probes can sometimes produce false-positive readings. For example, if the inside surface of the well has condensation above the water level, then an electronic water-level probe may produce a signal by contacting the side of the well rather than the true water level in the well. To produce reliable data, the electronic water level probe and/or interface probe should be raised and lowered several times at the approximate depth where the instrument produces a tone indicating a fluid interface to verify consistent, repeatable results.

The graduated tape or cable with depth markings is designed to indicate the depth of the electronic sensor that detects the fluid interface, but not the depth of the bottom of the instrument. When using these devices to measure the total well depth, the additional length of the instrument below the electronic sensor must be added to the apparent well depth reading, as observed on the tape or cable of the instrument, to obtain the true total depth of the well. If the depth markings on the tape or cable are

worn or otherwise difficult to read, extra care must be taken in obtaining the depth readings.

V. Health and Safety Considerations

The HASP will be followed, as appropriate, to ensure the safety of field personnel. Access to wells may expose field personnel to hazardous materials such as contaminated groundwater or oil. Other potential hazards include stinging insects that may inhabit well heads, other biologic hazards, and potentially the use of sharp cutting tools (scissors, knife). Appropriate personal protective equipment (PPE) will be worn during these activities. Field personnel will thoroughly review client-specific health and safety requirements, which may preclude the use of fixed/folding-blade knives.

VI. Procedure

Electronic Water-Level Indicators and Oil-Water Indicators

Calibration procedures and groundwater level measurement procedures for electronic water-level indicators and oil-water indicators are described in the sections below.

Calibration Procedures

The indicator probe will be tested to verify that the meter has been correctly calibrated by the manufacturer. The following steps will be used to verify the accuracy of the indicator:

1. Measure the lengths between each increment marker on the indicator with a measuring tape. The appropriate length of indicator measuring tape, suitable to cover the depth range for the wells of interest, will be checked for accuracy.

2. If the indicator measuring tape is inaccurate, the probe will be sent back to the manufacturer.

3. Equipment calibration will be recorded in the field logbook and/or PDA.

Groundwater Level Measurement Procedures

A detailed procedure for obtaining water elevations will be as follows:

1. Identify site and monitoring well number in field notebook along with date, time, personnel and weather conditions using indelible ink.

2. Use safety equipment as specified in the Health and Safety Plan.

3. Decontaminate the indicator probe and tape in accordance with the appropriate cleaning procedures.

4. Place clean plastic sheeting on the ground next to the well.

5. Unlock and open the monitoring well cover while standing upwind from the well.

6. Measure the volatile organics present in the monitoring well head space with a PID and record the PID reading in the field logbook.

7. Allow the water level in the well to equilibrate with atmospheric pressure for a few minutes. Locate a measuring reference point on the monitoring well casing. If one is not found, create a reference point by notching the highest point on the inner casing (or outer if an inner casing is not present) with a hacksaw. All downhole measurements will be taken from the reference point. Document the creation of any new reference point or alteration of the existing reference point.

8. Measure to the nearest 0.01 foot and record the height of the inner and outer casing from reference point to ground level.

9. Slowly lower the level indicator probe until it touches the bottom of the well. Record the total depth of the well from the top of the inner casing (or outer casing if inner casing is not present). Measure depth to water level as the probe is drawn back up through the water column. If used to measure the level of surface water, slowly lower from the surveyed reference point, as appropriate. Double check all measurements and record depths to the nearest 0.01 foot.

10. Decontaminate the instrument using appropriate cleaning procedures.

11. Lock the well when all activities are completed.

Pressure Transducers

The detailed procedure for obtaining water elevations using a Mini-Troll® or Troll® pressure transducer with an In-Situ™ data logger and the Win-Situ software package will be as follows:

Setup Procedures

1. Connect the Mini-Troll® or Troll® transducer to a laptop computer serial port.

2. Open the Win-Situ software package on the laptop computer.

3. Verify that the Win-Situ software recognizes the transducer.

4. Synchronize the clock on the laptop computer with that of the transducer.

5. Add a test to the transducer and input the specifications of the test (e.g., frequency of data collection, start data collection).

6. Disconnect the transducer from the laptop computer, and prepare the transducer for field deployment.

Field Procedures

1. Decontaminate all equipment entering the monitoring well using appropriate cleaning procedures.

2. Connect transducer to laptop computer, and start the Win-Situ program.

3. Lower the transducer gently below the water table or surface-water level.

4. Take a water level reading from the transducer using the Win-Situ software package. Lift the transducer approximately 1-foot, and verify the transducer response on the Win-Situ program (i.e. depth to water should be 1-foot less).

5. Upon verification, set the transducer to the desired depth. Position the instrument below the lowest anticipated water level, but not so low that its range will be exceeded at the highest anticipated water level. The maximum operating depth below water is equal to 2.31 feet times the psi rating of the transducer (e.g., 23.1 feet for a 10 psi transducer).

6. Secure the cable at the well head or fixed object adjacent to surface-water body to prevent drift and movement.

7. Obtain a manual water-level reading using the procedure noted above, and record the measurement in the field notebook or PDA.

8. Set reference point (e.g. depth to water, groundwater elevation) and input it into the Win-Situ software package.

9. Periodically download data and collect additional manual depth-to-water measurements using the same water-level or oil-water indicator probe used during the equipment setup to verify the accuracy of the transducer.

VII. Waste Management

Decontamination fluids, PPE, and other disposable equipment will be properly stored on site in labeled containers and disposed of properly. Be certain that waste containers are properly labeled and documented in the field log book. Review appropriate waste management SOPs, which may be state- or client-specific.

VIII. Data Recording and Management

Groundwater level measurements should be documented in the field logbook and/or PDA. The following information will be documented in the field logbook:

- Sample identification
- Measurement time
- Total well depth
- Depth to water

Groundwater elevations recorded using a Mini-Troll® or Troll® pressure transducer with an In-Situ™ data logger and the Win-Situ software package will be downloaded and stored in the central project file.

IX. Quality Assurance

As described in the detailed procedure, the electronic water-level meter and/or oil-water interface probe will be calibrated prior to use versus an engineer's rule to ensure accurate length demarcations on the tape or cable. Fluid interface measurements will be verified by gently raising and lowering the instrument through each interface to confirm repeatable results.

X. References

No literature references are required for this SOP.

Monitoring Well Installation

Rev. #: 3

Rev Date: February 2, 2011

Approval Signatures

Prepared by: Date: 2/2/2011

Reviewed by: Date: 2/2/2011

(Technical Expert)

I. Scope and Application

The procedures set out herein are designed to produce standard groundwater monitoring wells suitable for: (1) groundwater sampling, (2) water level measurement, (3) bulk hydraulic conductivity testing of formations adjacent to the open interval of the well.

Monitoring well boreholes in unconsolidated (overburden) materials are typically drilled using the hollow-stem auger drilling method. Other drilling methods that are also suitable for installing overburden monitoring wells, and are sometimes necessary due to site-specific geologic conditions, include: drive-and-wash, spun casing, Rotasonic, dual-rotary (Barber Rig), and fluid/mud rotary with core barrel or roller bit. Direct-push techniques (e.g., Geoprobe or cone penetrometer) and driven well points may also be used in some cases within the overburden. Monitoring wells within consolidated materials such as bedrock are commonly drilled using water-rotary (coring or tri-cone roller bit), air rotary or Rotasonic methods. The drilling method to be used at a given site will be selected based on site-specific consideration of anticipated drilling/well depths, site or regional geologic knowledge, type of monitoring to be conducted using the installed well, and cost.

No oils or grease will be used on equipment introduced into the boring (e.g., drill rod, casing, or sampling tools). No polyvinyl chloride (PVC) glue/cement will be used in constructing or retrofitting monitoring wells that will be used for water-quality monitoring. No coated bentonite pellets will be used in the well drilling or construction process. Specifications of materials to be installed in the well will be obtained prior to mobilizing onsite, including:

- well casing;
- bentonite;
- sand; and
- grout.

Well materials will be inspected and, if needed, cleaned prior to installation.

II. Personnel Qualifications

Monitoring well installation activities will be performed by persons who have been trained in proper well installation procedures under the guidance of an experienced field geologist, engineer, or technician. Where field sampling is performed for soil or

bedrock characterization, field personnel will have undergone in-field training in soil or bedrock description methods, as described in the appropriate SOP(s) for those activities.

III. Equipment List

The following materials will be available during soil boring and monitoring well installation activities, as required:

- Site Plan with proposed soil boring/well locations;
- Work Plan or Field Sampling Plan (FSP), and site Health and Safety Plan (HASP);
- personal protective equipment (PPE), as required by the HASP;
- traffic cones, delineators, caution tape, and/or fencing as appropriate for securing the work area, if such are not provided by drillers;
- appropriate soil sampling equipment (e.g., stainless steel spatulas, knife);
- soil and/or bedrock logging equipment as specified in the appropriate SOPs;
- appropriate sample containers and labels;
- drum labels as required for investigation derived waste handling;
- chain-of-custody forms;
- insulated coolers with ice, when collecting samples requiring preservation by chilling;
- photoionization detector (PID) or flame ionization detector (FID);
- ziplock style bags;
- water level or oil/water interface meter;
- locks and keys for securing the well after installation;
- decontamination equipment (bucket, distilled or deionized water, cleansers appropriate for removing expected chemicals of concern, paper towels);

- field notebook.

Prior to mobilizing to the site, ARCADIS personnel will contact the drilling subcontractor or in-house driller (as appropriate) to confirm that appropriate sampling and well installation equipment will be provided. Specifications of the sampling and well installation equipment are expected to vary by project, and so communication with the driller will be necessary to ensure that the materials provided will meet the project objectives. Equipment typically provided by the driller could include:

- drilling equipment required by the American Society of Testing and Materials (ASTM) D 1586, when performing split-spoon sampling;
- disposable plastic liners, when drilling with direct-push equipment;
- drums for investigation derived waste;
- drilling and sampling equipment decontamination materials;
- decontamination pad materials, if required; and
- well construction materials.

IV. Cautions

Prior to beginning field work, underground utilities in the vicinity of the drilling areas will be delineated by the drilling contractor or an independent underground utility locator service. See separate SOP for utility clearance.

Some regulatory agencies require a minimum annular space between the well or permanent casing and the borehole wall. When specified, the minimum clearance is typically 2 inches on all sides (e.g., a 2-inch diameter well requires a 6-inch diameter borehole). In addition, some regulatory agencies have specific requirements regarding grout mixtures. Determine whether the oversight agency has any such requirements prior to finalizing the drilling and well installation plan.

If dense non-aqueous phase liquids (DNAPL) are known or expected to exist at the site, refer to the DNAPL Contingency Plan SOP for additional details regarding drilling and well installation to reduce the potential for inadvertent DNAPL remobilization.

Similarly, if light non-aqueous phase liquids (LNAPLs) are known or expected to be present as “perched” layers above the water table, refer to the DNAPL Contingency

Plan. Follow the general provisions and concepts in the DNAPL contingency plan during drilling above the water table at known or expected LNAPL sites.

Avoid using drilling fluids or materials that could impact groundwater or soil quality, or could be incompatible with the subsurface conditions.

Similarly, consider the material compatibility between the well materials and the surrounding environment. For example, PVC well materials are not preferred when DNAPL is present. In addition, some groundwater conditions leach metals from stainless steel.

Water used for drilling and sampling of soil or bedrock, decontamination of drilling/sampling equipment, or grouting boreholes upon completion will be of a quality acceptable for project objectives. Testing of water supply should be considered.

Specifications of materials used for backfilling bore hole will be obtained, reviewed and approved to meet project quality objectives. Bentonite is not recommended where DNAPLs are likely to be present. In these situations, neat cement grout is preferred.

No coated bentonite pellets will be used in monitoring well construction, as the coating could impact the water quality in the completed well.

Monitoring wells may be installed with Schedule 40 polyvinyl chloride (PVC) to a maximum depth of 200 feet below ground surface (bgs). PVC monitoring wells between 200 and 400 feet total depth will be constructed using Schedule 80 PVC. Monitoring wells deeper than 400 feet will be constructed using steel.

V. Health and Safety Considerations

Field activities associated with monitoring well installation will be performed in accordance with a site-specific HASP, a copy of which will be present on site during such activities.

VI. Procedures

The procedures for installing groundwater monitoring wells are presented below:

Hollow-Stem Auger, Drive-and-Wash, Spun Casing, Fluid/Mud Rotary, Rotasonic, and Dual-Rotary Drilling Methods

1. Locate boring/well location, establish work zone, and set up sampling equipment decontamination area.

2. Advance boring to desired depth. Collect soil and/or bedrock samples at appropriate interval as specified in the Work Plan and/or FSP. Collect, document, and store samples for laboratory analysis as specified in the Work Plan and/or FSP. Decontaminate equipment between samples in accordance with the Work Plan and/or FSP. A common sampling method that produces high-quality soil samples with relatively little soil disturbance is the ASTM D 1586 - Standard Test Method for Penetration Test and Split-Barrel Sampling of Soils. Split-spoon samples are obtained during drilling using hollow-stem auger, drive-and-wash, spun casing, and fluid/mud rotary. Rotasonic drilling produces large-diameter soil cores that tend to be more disturbed than split-spoon samples due to the vibratory action of the drill casing. Dual-rotary removes cuttings by compressed air and allows only a general assessment of geology. High-quality bedrock samples can be obtained by coring.

3. Describe each soil or bedrock sample as outlined in the appropriate SOP. Record descriptions in the field notebook and/or personal digital assistant (PDA). It should be noted that PDA logs must be electronically backed up and transferred to a location accessible to other project team members as soon as feasible to retain and protect the field data. During soil boring advancement, document all drilling events in field notebook, including blow counts (number of blows required to advance split-spoon sampler in 6-inch increments) and work stoppages. Blow counts will not be available if Rotasonic, dual-rotary, or direct-push methods are used. When drilling in bedrock, the rate of penetration (minutes per foot) is recorded.

4. If it is necessary to install a monitor well into a permeable zone below a confining layer, particularly if the deeper zone is believed to have water quality that differs significantly from the zone above the confining layer, then a telescopic well construction should be considered. In this case, the borehole is advanced approximately 3 to 5 feet into the top of the confining layer, and a permanent casing (typically PVC, black steel or stainless steel) is installed into the socket drilled into the top of the confining layer. The casing is then grouted in place. The preferred methods of grouting telescoping casings include: pressure-injection grouting using an inflatable packer installed temporarily into the base of the casing, such that grout is injected out the bottom of the casing until it is observed at ground surface outside the casing; displacement-method grouting (also known as the Halliburton method), which entails filling the casing with grout and displacing the grout out the bottom of the casing by pushing a drillable plug, typically made of wood to the bottom of the casing, following by tremie grouting the remainder of the annulus outside the casing; or tremie grouting the annulus surrounding the casing using a tremie pipe installed to the base of the borehole. In all three cases, the casing is grouted to the ground

surface, and the grout is allowed to set prior to drilling deeper through the casing. Site-specific criteria and work plans should be created for the completion of non-standard monitoring wells, including telescopic wells.

5. In consolidated formations such as competent bedrock, a monitoring well may be completed with an open borehole interval without a screen and sandpack. In these cases, the borehole is advanced to the targeted depth of the top of the open interval. A permanent casing is then grouted in place following the procedures described in Step 4 above. After the grout sets, the borehole is advanced by drilling through the permanent casing to the targeted bottom depth of the open interval, which then serves as the monitoring interval for the well. If open-borehole interval stability is found to be questionable or if a specific depth interval is later selected for monitoring, a screened monitoring well may later be installed within the open-borehole interval, depending on the annular space and well diameter requirements.

6. Before installing a screened well – or after drilling an open-bedrock well –, it is important to confirm that the borehole has been advanced into the saturated zone. This is particularly important for wells installed to monitor the water table and/or the shallow saturated zone, as the capillary fringe may cause soils above the water table to appear saturated. If one or more previously installed monitoring wells exist nearby, use the depth to water at such well(s) to estimate the water-table depth at the new borehole location.

   To verify that the borehole has been advanced into the saturated zone, it is necessary to measure the water level in the borehole. For boreholes drilled without using water (e.g., hollow-stem auger, cable-tool, air rotary, air hammer), verify the presence of groundwater (and /or LNAPL, if applicable) in the borehole using an electronic water level probe, oil-water interface probe, or a new or decontaminated bailer. For boreholes drilled using water (e.g., drive and wash, spun-casing with roller-bit wash, rotasonic, or water rotary with core or roller bit), monitor the water level in the borehole as it re-equilibrates to the static level. In low-permeability units like clay, fine-grained glacial tills, shale and other bedrock formations, it may be necessary to wait overnight to allow the water level to equilibrate. To the extent practicable, ensure that the depth of the well below the apparent water table is deep enough so that the installed well can monitor groundwater year-round, accounting for seasonal water-table fluctuations. In most cases, the well should be installed at least five feet below the water-table depth, determined as described above. When in doubt, err on the side of slightly deeper well installation.

If necessary, the borehole should be drilled deeper to ensure that the well may intersects the water table or a permeable water-bearing zone.

7. Upon completing the borehole to the desired depth, if a screened well construction is desired, install the monitoring well by lowering the screen and casing assembly with sump through the augers or casing. Monitoring wells typically will be constructed of 2-inch-diameter, flush-threaded PVC or stainless steel slotted well screen and blank riser casing. Smaller diameters may be used if wells are installed using direct-push methodology or if multiple wells are to be installed in a single borehole. The screen length will be specified in the Work Plan or FSP based on regulatory requirements and specific monitoring objectives. Monitoring well screens are usually 5 to 10 feet long, but may be up to 25 feet long in very low permeability, thick geologic formations. The screen length will depend on the purpose for the well and the objectives of the groundwater investigation. Typically, the slot size will be 0.010 inch and the sand pack will be 20-40, Morie No. 0, or equivalent. In very fine-grained formations where sample turbidity needs to be minimized, it may be preferred to use a 0.006-inch slot size and 30-65, Morie No. 00, or equivalent sand pack. Alternatively, where monitoring wells are installed in coarse-grained deposits and higher well yield is required, a 0.020-inch slot size and 10-20, Morie No. 1, or equivalent sand pack may be preferred. To the extent practicable, the slot size and sand pack gradation may be predetermined in the Work Plan or FSP based on site-specific grain-size analysis or other geologic considerations or monitoring objectives. A blank sump may be attached below the well screen if the well is being installed for DNAPL recovery/monitoring purposes. If so, the annular space around the sump will be backfilled with neat cement grout to the bottom of the well screen prior to placing the sand pack around the screen. A blank riser will extend from the top of the screen to approximately 2.5 feet above grade or, if necessary, just below grade where conditions warrant a flush-mounted monitoring well. For wells greater than 50 feet deep, centralizers may be desired to assist in centralizing the monitoring well in the borehole during construction.

8. When the monitoring well assembly has been set in place and the grout has been placed around the sump (if any), place a washed silica sand pack in the annular space from the bottom of the boring to a height of 1 to 2 feet above the top of the well screen. The sand pack is placed and drilling equipment extracted in increments until the top of the sand pack is at the appropriate depth. The sand pack will be consistent with the screen slot size and the soil particle size in the screened interval, as specified in the Work Plan or FSP. A hydrated bentonite seal (a minimum of 2 feet thick) will then be placed in the annular space above the sand pack. If non-hydrated bentonite is used, the bentonite

should be permitted to hydrate in place for a minimum of 30 minutes before proceeding. No coated bentonite pellets will be used in monitoring well drilling or construction. Potable water may be added to hydrate the bentonite if the seal is above the water table. Monitor the placement of the sand pack and bentonite with a weighted tape measure. During the extraction of the augers or casing, a cement/bentonite or neat cement grout will be placed in the annular space from the bentonite seal to a depth approximately 2 feet bgs.

9. Place a locking, steel protective casing (extended at least 1.5 feet below grade and 2 feet above grade) over the riser casing and secure with a neat cement seal. Alternatively, for flush-mount completions, place a steel curb box with a bolt-down lid over the riser casing and secure with a neat cement seal. In either case, the cement seal will extend approximately 1.5 to 2.0 feet below grade and laterally at least 1 foot in all directions from the protective casing, and should slope gently away to promote drainage away from the well. Monitoring wells will be labeled with the appropriate designation on both the inner and outer well casings or inside of the curb box lid.

   When an above-grade completion is used, the PVC riser will be sealed using an expandable locking plug and the top of the well will be vented by drilling a small-diameter (1/8 inch) hole near the top of the well casing or through the locking plug, or by cutting a vertical slot in the top of the well casing. When a flush-mount installation is used, the PVC riser will be sealed using an unvented, expandable locking plug.

10. During well installation, record construction details and actual measurements relayed by the drilling contractor and tabulate materials used (e.g., screen and riser footages; bags of bentonite, cement, and sand) in the field notebook.

11. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section VII below.

Direct-Push Method

The direct-push drilling method may also be used to complete soil borings and install monitoring wells. Examples of this technique include the Diedrich ESP vibratory probe system, GeoProbe®, or AMS Power Probe® dual-tube system. Environmental probe systems typically use a hydraulically operated percussion hammer. Depending on the equipment used, the hammer delivers 140- to 350-foot pounds of energy with each blow. The hammer provides the force needed to penetrate very stiff/medium dense soil formations. The hammer simultaneously advances an outer steel casing that contains a dual-tube liner for sampling soil. The outside diameter (OD) of the outer

casing ranges from 1.75 to 2.4 inches and the OD of the inner sampling tube ranges from 1.1 to 1.8 inches. The outer casing isolates shallow layers and permits the unit to continue to probe at depth. The double-rod system provides a borehole that may be tremie-grouted from the bottom up. Alternatively, the inside diameter (ID) of the steel casing provides clearance for the installation of small-diameter (e.g., 0.75- to 1-inch ID) micro-wells. The procedures for installing monitoring wells in soil using the direct-push method are described below.

1. Locate boring/well location, establish work zone, and set up sample equipment decontamination area.

2. Advance soil boring to designated depth, collecting samples at intervals specified in the Work Plan. Samples will be collected using dedicated, disposable, plastic liners. Describe samples in accordance with the procedures outlined in Step 3 above. Collect samples for laboratory analysis as specified in the Work Plan and/or FSP.

3. Upon advancing the borehole to the desired depth, install the micro-well through the inner drill casing. The micro-well will consist of approximately 1-inch ID PVC or stainless steel slotted screen and blank riser. The sand pack, bentonite seal, and cement/bentonite grout will be installed as described, where applicable, in Step 7 and 8 above.

4. Install protective steel casing or flush-mount, as appropriate, as described in Step 9 above. During well installation, record construction details and tabulate materials used.

5. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section VII below.

Driven Well Point Installation

Well points will be installed by pushing or driving using a drilling rig or direct-push rig, or hand-driven where possible. The well point construction materials will consist of a 1- to 2-inch-diameter threaded steel casing with either 0.010- or 0.020-inch slotted stainless steel screen. The screen length will vary depending on the hydrogeologic conditions of the site. The casings will be joined together with threaded couplings and the terminal end will consist of a steel well point. Because they are driven or pushed to the desired depth, well points do not have annular backfill materials such as sand pack or grout.

VII. Waste Management

Investigation-derived wastes (IDW), including soil cuttings and excess drilling fluids (if used), decontamination liquids, and disposable materials (well material packages, PPE, etc.), will be placed in clearly labeled, appropriate containers, or managed as otherwise specified in the Work Plan, FSP, and/or IDW management SOP.

VIII. Data Recording and Management

Drilling activities will be documented in a field notebook. Pertinent information will include personnel present on site, times of arrival and departure, significant weather conditions, timing of well installation activities, soil descriptions, well construction specifications (screen and riser material and diameter, sump length, screen length and slot size, riser length, sand pack type), and quantities of materials used. In addition, the locations of newly-installed wells will be documented photographically or in a site sketch. If appropriate, a measuring wheel or engineer's tape will be used to determine approximate distances between important site features.

The well or piezometer location, ground surface elevation, and inner and outer casing elevations will be surveyed using the method specified in the site Work Plan. Generally, a local baseline control will be set up. This local baseline control can then be tied into the appropriate vertical and horizontal datum, such as the National Geodetic Vertical Datum of 1929 or 1988 and the State Plane Coordinate System. At a minimum, the elevation of the top of the inner casing used for water-level measurements should be measured to the nearest 0.01 foot. Elevations will be established in relation to the National Geodetic Vertical Datum of 1929. A permanent mark will be placed on top of the inner casing to mark the point for water-level measurements.

IX. Quality Assurance

All drilling equipment and associated tools (including augers, drill rods, sampling equipment, wrenches, and any other equipment or tools) that may have come in contact with soil will be cleaned in accordance with the procedures outlined in the appropriate SOP. Well materials will also be cleaned prior to well installation.

Monitoring Well Development

Rev. #: 2.2

Rev. Date: March 22, 2010

Approval Signatures

Prepared by: Date: 03/22/2010

Reviewed by: Date: 03/22/2010

(Technical Expert)

I. Scope and Application

Monitoring wells (or piezometers, well points, or micro-wells) will be developed to clear them of fine-grained sediment to enhance the hydraulic connection between the well and the surrounding geologic formation. Development will be accomplished by evacuating well water by either pumping or bailing. Prior to pumping or bailing, the screened interval will be gently surged using a surge block, bailer, or inertia pump with optional surgeblock fitting as appropriate. Accumulated sediment in the bottom of the well (if present) will be removed by bailing with a bottom-loading bailer or via pumping using a submersible or inertia pump with optional surge-block fitting. Wells will also be gently brushed with a weighted brush to assist in removing loose debris, silt or flock attached to the inside of the well riser and/or screen prior to development. Pumping methods will be selected based on site-specific geologic conditions, anticipated well yield, water table depth, and groundwater monitoring objectives, and may include one or more of the following:

- submersible pump
- inertial pump (Waterra™ pump or equivalent)
- bladder pump
- peristaltic pump
- centrifugal pump

When developing a well using the pumping method, the pump (or, with inertial pumps, the tubing) is lowered to the screened portion of the well. During purging, the pump or tubing is moved up and down the screened interval until the well yields relatively clear water.

Submersible pumps have a motor-driven impeller that pushes the groundwater through discharge tubing to the ground surface. Inertial pumps have a check valve at the bottom of stiff tubing which, when operated up and down, lifts water to the ground surface. Bladder pumps have a bottom check valve and a flexible internal bladder that fills from below and is then compressed using pressurized air to force water out the top of the bladder through the discharge tubing to the ground surface. These three types of pumps have a wide range of applicability in terms of well depth and water depth.

Centrifugal and peristaltic pumps use atmospheric pressure to lift water from the well, and therefore can only be practically used where the depth to water is less than 25 feet.

II. Personnel Qualifications

Monitoring well development activities will be performed by persons who have been trained in proper well development procedures under the guidance of an experienced field geologist, engineer, or technician.

III. Equipment List

Materials for monitoring well development using a pump include the following:

- health and safety equipment, as required by the site Health and Safety Plan (HASP):
- cleaning equipment
- photoionization detector (PID) to measure headspace vapors
- pump
- polyethylene pump discharge tubing
- plastic sheeting
- power source (generator or battery)
- field notebook and/or personal digital assistant (PDA)
- graduated pails
- appropriate containers

- monitoring well keys
- water level indicator

Materials for monitoring well development using a bailer include the following:

- personal protective equipment (PPE) as required by the HASP
- cleaning equipment
- PID to measure headspace vapors
- bottom-loading bailer, sand bailer
- polypropylene or nylon rope
- plastic sheeting
- graduated pails
- appropriate containers
- keys to wells
- field notebook and/or PDA
- water level indicator
- weighted brush for well brushing

IV. Cautions

Where surging is performed to assist in removing fine-grained material from the sand pack, surging must be performed in a gentle manner. Excessive suction could promote fine-grained sediment entry into the outside of the sand pack from the formation.

Avoid using development fluids or materials that could impact groundwater or soil quality, or could be incompatible with the subsurface conditions.

In some cases it may be necessary to add potable water to a well to allow surging and development, especially for new monitoring wells installed in low permeability formations. Before adding potable water to a well, the Project Manager (PM) must be notified and the PM shall make the decision regarding the appropriateness and applicability of adding potable water to a well during well development procedures. If potable water is to be added to a well as part of development, the potable water source should be sampled and analyzed for constituents of concern, and the results evaluated by the PM prior to adding the potable water to the well. If potable water is added to a well for development purposes, at the end of development the well will be purged dry to remove the potable water, or if the well no longer goes dry then the well will be purged to remove at least three times the volume of potable water that was added.

V. Health and Safety Considerations

Field activities associated with monitoring well development will be performed in accordance with a site-specific HASP, a copy of which will be present on site during such activities.

VI. Procedure

The procedures for monitoring well development are described below. (Note: Steps 7, 8, and 10 can be performed at the same time using an inertial pump with a surge-block fitting.)

1. Don appropriate PPE (as required by the HASP).

2. Place plastic sheeting around the well.

3. Clean all equipment entering each monitoring well, except for new, disposable materials that have not been previously used.

4. Open the well cover while standing upwind of the well, remove well cap. Insert PID probe approximately 4 to 6 inches into the casing or the well headspace and cover with gloved hand. Record the PID reading in the field notebook. If the well headspace reading is less than 5 PID units, proceed; if the headspace reading is greater than 5 PID units, screen the air within the breathing zone. If the PID reading in the breathing zone is below 5 PID units, proceed. If the PID reading is above 5 PID units, move upwind from well for 5 minutes to allow the volatiles to dissipate. Repeat the breathing zone test. If the reading is still above 5 PID units, don the appropriate respiratory protection in accordance with the requirements of the HASP. Record all PID readings.

5. Obtain an initial measurement of the depth to water and the total well depth from the reference point at the top of the well casing. Record these measurements in the field log book.

6. Prior to redeveloping older wells that may contain solid particulate debris along the inside of the well casing and screen, gently lower and raise a weighted brush along the entire length of the well screen and riser to free and assist in removing loose debris, silt or flock. Perform a minimum of 4 “passes” along the screened and cased intervals of the well below the static water level in the well. Allow the resulting suspended material to settle for a minimum of one day prior to continuing with redevelopment activities.

7. Lower a surge block or bailer into the screened portion of the well. Gently raise and lower the surge block or bailer within the screened interval of the well to force water in and out of the screen slots and sand pack. Continue surging for 15 to 30 minutes.

8. Lower a bottom-loading bailer, submersible pump, or inertia pump tubing with check valve to the bottom of the well and gently bounce the bailer, pump, pump tubing on the bottom of the well to collect/remove accumulated sediment, if any. Remove and empty the bailer, if used. Repeat until the bailed/pumped water is free of excessive sediment and the bottom of the well feels solid. Alternatively, measurement of the well depth with a water level indicator can be used to verify that sediment and/or silt has been removed to the extent practicable, based on a comparison with the well installation log or previous measurement of total well depth.

9. After surging the well and removing excess accumulated sediment from the bottom of the well, re-measure the depth-to-water and the total well depth from the reference point at the top of the well casing. Record these measurements in the field log book.

10. Remove formation water by pumping or bailing. Where pumping is used, measure and record the pre-pumping water level. Operate the pump at a relatively constant rate. Measure the pumping rate using a calibrated container and stop watch, and record the pumping rate in the field log book. Measure and record the water level in the well at least

once every 5 minutes during pumping. Note any relevant observations in terms of water color, visual level of turbidity, sheen, odors, etc. Pump or bail until termination criteria specified in the Field Sampling Plan (FSP) are reached. Record the total volume of water purged from the well.

11. If the well goes dry, stop pumping or bailing. Note the time that the well went dry. After allowing the well to recover, note the time and depth to water. Resume pumping or bailing when sufficient water has recharged the well.

12. Contain all water in appropriate containers.

13. When complete, secure the lid back on the well.

14. Place disposable materials in plastic bags for appropriate disposal and decontaminate reusable, downhole pump components and/or bailer.

VII. Waste Management

Materials generated during monitoring well installation and development will be placed in appropriate labeled containers and disposed of as described in the Work Plan or Field Sampling Plan.

VIII. Data Recording and Management

Well development activities will be documented in a proper field notebook and/or PDA. Pertinent information will include personnel present on site; times of arrival and departure; significant weather conditions; timing of well development activities; development method(s); observations of purge water color, turbidity, odor, sheen, etc.; purge rate; and water levels before and during pumping.

IX. Quality Assurance

All reused, non-disposable, downhole well development equipment will be cleaned in accordance with the procedures outlined in the Field Equipment Cleaning-Decontamination SOP.

Bailer-Grab Groundwater Sampling

Rev. #: 0

Rev Date: March 10, 2009

Approval Signatures

Prepared by: _____ Date: 3/10/09
Loren North

Reviewed by: _____ Date: 3/10/09
Michael Gefell (Technical Expert)

I. Scope and Application

The objective of this Standard Operating Procedure (SOP) is to describe the procedure to collect groundwater samples using bailers with no purging of the monitoring well, piezometer, etc. This SOP describes the equipment, field procedures, materials, and documentation procedures necessary to collect groundwater samples by "bailer grab" sampling.

This SOP may be varied or changed, as required, depending on site conditions, equipment limitations, or limitations imposed by the procedure. The ultimate procedure employed will be documented in the project work plans or reports.

II. Personnel Qualifications

Field sampling personnel will have current health and safety training, including 40-hour Hazardous Waste Operations and Emergency Response Standard (HAZWOPER) training, site supervisor training, site-specific training, first aid, and cardiopulmonary resuscitation (CPR), as needed. In addition, field sampling personnel will be versed in the relevant SOPs and possess the required skills and experience necessary to successfully complete the desired field work.

III. Equipment List

- Electronic water-level or oil-water level indicator;
- Plastic sheeting;
- Masking tape;
- Tape measure;
- Appropriate cleaning materials;
- Well keys;
- Bailer;
- Polyethylene or nylon rope;
- Field notebook/logs/forms; and

- Personal protective equipment (PPE), as required by the Health and Safety Plan (HASP).

IV. Cautions

Two types of bailers are available for obtaining grab samples from wells: a point-source bailer; and an open bailer. A point source bailer is constructed of stainless steel and has dual ball valves at the top and bottom which prevent mixing of water with a sample collected at a discrete interval. Open bailers can be stainless steel, Teflon®, PVC, or polyethylene. Disposable open bailers are typically made of polyethylene. An open bailer has one bottom ball valve. After the point-source or open bailer is lowered to the desired depth, the bailer is retrieved upward and the valve(s) retain the sample of water in the bailer. Because the top of the open bailer is exposed to the water in the overlying water column, it is possible that the sample could mix, to some degree with the water column above the bailer upon removal from the well. Thus, open bailers should not be used in situations where a substantial water column length exists above the sampling depth. In addition, bailer grab sampling is not recommended in monitoring wells (or piezometers) containing a floating layer of light, non-aqueous phase liquid (LNAPL), also known as separate phase hydrocarbons.

Avoid introduction of surface soils or other materials by staging down-hole equipment on a clean and dry working surface.

A Shipping Determination must be performed, by DOT-trained personnel, for all environmental and geotechnical samples that are to be shipped, as well as some types of environmental equipment/supplies that are to be shipped.

V. Health and Safety Considerations

Upon opening monitoring wells, monitor well headspace and breathing zone using equipment specified in the HASP. Follow the HASP in terms of PPE and other safety requirements.

VI. Procedure

1. Open the well and obtained a depth to water measurement using a properly decontaminated water level indicator or oil-water level indicator.

2. Based on the depth to water and the total well depth (based on well log, accounting for the “stickup height above grade”), calculate the length of the water column and the depth to the midpoint of the saturated screened or open interval from the top of casing (call this distance Z).

3. Tie an appropriate length of new, disposable polyethylene or nylon rope to a new, disposable or properly decontaminated bailer and, using a tape measure, measure from the midpoint of the bailer up the rope to the distance Z calculated above – mark the rope at this height with a knot or piece of masking tape. Avoid allowing the bailer or the rope to contact the ground surface by placing these on clean plastic sheeting next to the well, if necessary.

4. Slowly lower the bailer into the well; the rate of lowering should be no more than 0.5-ft per second within the water column. When the mark on the rope is at the top of casing, indicating that the midpoint of the bailer is at the midpoint of the saturated screened or open interval, slowly raise and retrieve the bailer from the well.

5. Fill sample vials and bottles as usual. If field filtering of metals samples is required, decant the water from the bailer into a sterile container and use a decontaminated peristaltic pump to pump the water through an appropriate disposable filter, collecting the filtered water directly in the appropriate sample containers. If field parameters are needed, measure them in the sterile container using appropriate field probes, or else use a downhole probe. Collect quality assurance/quality control (QA/QC) samples at the appropriate frequency as required under the standard sampling program. If additional sample volume is required at a well, repeat Step 4; however, repeat deployment of the bailer should be avoided if possible because it could increase sample turbidity and compromise sample quality.

6. Cap the well, properly decontaminate the water level meter or interface probe, and dispose of waste materials.

VII. Waste Management

Decontamination water will be disposed of properly. Rinse water, PPE, and other residuals generated during equipment decontamination will be placed in appropriate containers and labeled.

VIII. Data Recording and Management

Water-level measurements and depth calculations will be documented on the groundwater sampling log and/or the field logbook, including the following information:

- Well designation;
- Water-level measurement time;

- Total well depth;
- Depth to water; and
- Depth to midpoint of saturated screened or open interval.

In addition, the following information regarding the groundwater sample will be recorded:

- Type, size, and construction materials of bailer (point source or open);
- Type of rope;
- Time of sample collection;
- Type and volume of glassware filled, for which analytical methods;
- Field observations regarding groundwater sample (color; odor; presence of sheen, film, or particulate (if any); and
- Field parameter measurements.

IX. Quality Assurance

Depending on data quality objectives and data end use, aqueous QA/QC samples may be obtained.

Low-Flow Groundwater Purging and Sampling Procedures for Monitoring Wells

Rev. #: 4

Rev Date: February 2, 2011

Approval Signatures

Prepared by:  Date: 2/2/2011

Reviewed by: Date: 2/2/2011

(Technical Expert)

I. Scope and Application

Groundwater samples will be collected from monitoring wells to evaluate groundwater quality. The protocol presented in this standard operating procedure (SOP) describes the procedures to be used to purge monitoring wells and collect groundwater samples. This protocol has been developed in accordance with the United States Environmental Protection Agency (USEPA) Region I Low Stress (Low Flow) Purging and Sampling Procedures for the Collection of Groundwater Samples from Monitoring Wells (USEPA SOP No. GW0001; July 30, 1996). Both filtered and unfiltered groundwater samples may be collected using this low-flow sampling method. Filtered samples will be obtained using a 0.45-micron disposable filter. No wells will be sampled until well development has been performed in accordance with the procedures presented in the SOP titled Monitoring Well Development, unless that well has been sampled or developed within the prior 1-year time period. Groundwater samples will not be collected within 1 week following well development.

II. Personnel Qualifications

ARCADIS personnel directing, supervising, or leading groundwater sample collection activities should have a minimum of 2 years of previous groundwater sampling experience. ARCADIS personnel providing assistance to groundwater sample collection and associated activities should have a minimum of 6 months of related experience or an advanced degree in environmental sciences, engineering, hydrogeology, or geology.

The supervisor of the groundwater sampling team will have at least 1 year of previous supervised groundwater sampling experience.

Prior to mobilizing to the field, the groundwater sampling team should review and be thoroughly familiar with relevant site-specific documents including but not limited to the site work plan, field sampling plan, QAPP, HASP, and historical information. Additionally, the groundwater sampling team should review and be thoroughly familiar with documentation provided by equipment manufacturers for all equipment that will be used in the field prior to mobilization.

III. Equipment List

Specific to this activity, the following materials (or equivalent) will be available:

- Health and safety equipment (as required in the site Health and Safety Plan [HASP]).

- Site Plan, well construction records, prior groundwater sampling records (if available).
- Sampling pump, which may consist of one or more of the following:
  - submersible pump (e.g., Grundfos Redi-Flo 2);
  - peristaltic pump (e.g., ISCO Model 150); and/or
  - bladder pump (e.g., Marschalk System 1, QED Well Wizard, Geotech, etc.).
- Appropriate controller and power source for pump:
  - Submersible and peristaltic pumps require electric power from either a generator or a deep cell battery.
  - Submersible pumps such as Grundfos require a pump controller to run the pump
  - Bladder pumps require a pump controller and a gas source (e.g., air compressor or compressed N_2 or CO_2 gas cylinders).
- Teflon® tubing or Teflon®-lined polyethylene tubing of an appropriate size for the pump being used. For peristaltic pumps, dedicated Tygon® tubing (or other type as specified by the manufacturer) will also be used through the pump apparatus.
- Water-level probe (e.g., Solinist Model 101).
- Water-quality (temperature/pH/specific conductivity/ORP/turbidity/dissolved oxygen) meter and flow-through measurement cell. Several brands may be used, including:
  - YSI 6-Series Multi-Parameter Instrument;
  - Hydrolab Series 3 or Series 4a Multiprobe and Display; and/or
  - Horiba U-10 or U-22 Water Quality Monitoring System.
- Supplemental turbidity meter (e.g., Horiba U-10, Hach 2100P, LaMotte 2020). Turbidity measurements collected with multi-parameter meters have been shown to sometimes be unreliable due to fouling of the optic lens of the

turbidity meter within the flow-through cell. A supplemental turbidity meter will be used to verify turbidity data during purging if such fouling is suspected. Note that industry improvements may eliminate the need for these supplemental measurements in the future.

- Appropriate water sample containers (supplied by the laboratory).
- Appropriate blanks (trip blank supplied by the laboratory).
- 0.45-micron disposable filters (if field filtering is required).
- Large glass mixing container (if sampling with a bailer).
- Teflon® stirring rod (if sampling with a bailer).
- Cleaning equipment.
- Groundwater sampling log (attached) or bound field logbook.

Note that in the future, the client may acquire different makes/models of some of this equipment if the listed makes/models are no longer available, or as a result of general upgrades or additional equipment acquisitions. In the event that the client uses a different make/model of the equipment listed, the client will use an equivalent type of equipment (e.g., pumps, flow-through analytical cells) and note the specific make/model of the equipment used during a sampling event on the groundwater sampling log. In addition, should the client desire to change to a markedly different sampling methodology (e.g., discrete interval samplers, passive diffusion bags, or a yet to be developed technique), the client will submit a proposed SOP for the new methodology for USEPA approval prior to implementing such a change.

The maintenance requirements for the above equipment generally involve decontamination or periodic cleaning, battery charging, and proper storage, as specified by the manufacturer. For operational difficulties, the equipment will be serviced by a qualified technician.

IV. Cautions

If heavy precipitation occurs and no cover over the sampling area and monitoring well can be erected, sampling must be discontinued until adequate cover is provided. Rain water could contaminate groundwater samples.

Do not use permanent marker or felt-tip pens for labels on sample container or sample coolers – use indelible ink. The permanent markers could introduce volatile constituents into the samples.

It may be necessary to field filter some parameters (e.g., metals) prior to collection, depending on preservation, analytical method, and project quality objectives.

Store and/or stage empty and full sample containers and coolers out of direct sunlight.

To mitigate potential cross-contamination, groundwater samples are to be collected in a pre-determined order from least impacted to impacted based on previous analytical data. If no analytical data are available, samples are collected in order of upgradient, then furthest downgradient to source area locations.

Be careful not to over-tighten lids with Teflon liners or septa (e.g., 40 mL vials). Over-tightening can cause the glass to shatter or impair the integrity of the Teflon seal.

V. Health and Safety Considerations

Use caution and appropriate cut resistant gloves when tightening lids to 40 mL vials. These vials can break while tightening and can lacerate hand. Amber vials (thinner glass) are more prone to breakage.

If thunder or lighting is present, discontinue sampling and take cover until 30 minutes have passed after the last occurrence of thunder or lighting.

Use caution when removing well caps as well may be under pressure, cap can dislodge forcefully and cause injury.

Use caution when opening protective casing on stickup wells as wasps frequently nest inside the tops of the covers. Also watch for fire ant mounds near well pads when sampling in the south or western U.S.

VI. Procedure

Groundwater will be purged from the wells using an appropriate pump. Peristaltic pumps will initially be used to purge and sample all wells when applicable. If the depth to water is below the sampling range of a peristaltic pump (approximately 25 feet), submersible pumps or bladder pumps will be used provided the well is constructed with a casing diameter greater than or equal to 2 inches (the minimum well diameter capable of accommodating such pumps). Bladder pumps are preferred over peristaltic and submersible pumps if sampling of VOCs is required to prevent volatilization. For smaller diameter wells where the depth to water is below the sampling range of a

peristaltic pump, alternative sampling methods (i.e., bailing or small diameter bladder pumps) will be used to purge and sample the groundwater. Purge water will be collected and containerized.

1. Calibrate field instruments according to manufacturer procedures for calibration.

2. Measure initial depth to groundwater prior to placement of pumps.

3. Prepare and install pump in well: For submersible and non-dedicated bladder pumps, decontaminate pump according to site decontamination procedures. Non-dedicated bladder pumps will require a new Teflon® bladder and attachment of an air line, sample discharge line, and safety cable prior to placement in the well. Attach the air line tubing to the air port on the top of the bladder pump. Attach the sample discharge tubing to the water port on the top of the bladder pump. Care should be taken not to reverse the air and discharge tubing lines during bladder pump set-up as this could result in bladder failure or rupture. Attach and secure a safety cable to the eyebolt on the top of bladder pump (if present, depending on pump model used). Slowly lower pump, safety cable, tubing, and electrical lines into the well to a depth corresponding to the approximate center of the saturated screen section of the well. Take care to avoid twisting and tangling of safety cable, tubing, and electrical lines while lowering pump into well; twisted and tangled lines could result in the pump becoming stuck in the well casing. Also, make sure to keep tubing and lines from touching the ground or other surfaces while introducing them into the well as this could lead to well contamination. If a peristaltic pump is being used, slowly lower the sampling tubing into the well to a depth corresponding to the approximate center of the saturated screen section of the well. The pump intake or sampling tube must be kept at least 2 feet above the bottom of the well to prevent mobilization of any sediment present in the bottom of the well.

4. If using a bladder pump, connect the air line to the pump controller output port. The pump controller should then be connected to a supply line from an air compressor or compressed gas cylinder using an appropriate regulator and air hose. Take care to tighten the regulator connector onto the gas cylinder (if used) to prevent leaks. Teflon tape may be used on the threads of the cylinder to provide a tighter seal. Once the air compressor or gas cylinder is connected to the pump controller, turn on the compressor or open the valve on the cylinder to begin the gas flow. Turn on the pump controller if an on/off switch is present and verify that all batteries are charged and fully operating before beginning to pump.

5. Connect the pump discharge water line to the bottom inlet port on the flow-through cell connected to the water quality meter.

6. Measure the water level again with the pump in the well before starting the pump. Start pumping the well at 200 to 500 milliliters (mL) per minute (or at lower site-specific rate if specified). The pump rate should be adjusted to cause little or no water level drawdown in the well (less than 0.3 feet below the initial static depth to water measurement) and the water level should stabilize. The water level should be monitored every 3 to 5 minutes (or as appropriate, lower flow rates may require longer time between readings) during pumping if the well diameter is of sufficient size to allow such monitoring. Care should be taken not to break pump suction or cause entrainment of air in the sample. Record pumping rate adjustments and depths to water. If necessary, pumping rates should be reduced to the minimum capabilities of the pump to avoid pumping the well dry and/or to stabilize indicator parameters. A steady flow rate should be maintained to the extent practicable. Groundwater sampling records from previous sampling events (if available) should be reviewed prior to mobilization to estimate the optimum pumping rate and anticipated drawdown for the well in order to more efficiently reach a stabilized pumping condition.

   If the recharge rate of the well is very low, alternative purging techniques should be used, which will vary based on the well construction and screen position. For wells screened across the water table, the well should be pumped dry and sampling should commence as soon as the volume in the well has recovered sufficiently to permit collection of samples. For wells screened entirely below the water table, the well should be pumped until a stabilized level (which may be below the maximum displacement goal of 0.3 feet) can be maintained and monitoring for stabilization of field indicator parameters can commence. If a lower stabilization level cannot be maintained, the well should be pumped until the drawdown is at a level slightly higher than the bentonite seal above the well screen. Sampling should commence after one well volume has been removed and the well has recovered sufficiently to permit collection of samples.

   During purging, monitor the field indicator parameters (e.g., turbidity, temperature, specific conductance, pH, etc.) every 3 to 5 minutes (or as appropriate). Field indicator parameters will be measured using a flow-through analytical cell or a clean container such as a glass beaker. Record field indicator parameters on the groundwater sampling log. The well is considered stabilized and ready for sample collection when turbidity values remain within 10% (or within 1 NTU if the turbidity reading is less than 10 NTU), the specific conductance and temperature values remain within 3%, ORP readings remain within ± 10 mV and pH remains within 0.1 units for three consecutive readings collected at 3- to 5-minute intervals (or other appropriate interval, alternate stabilization goals may exist in different geographic regions, consult the site-specific Work Plan for stabilization criteria). If the field indicator parameters do not stabilize within 1 hour of the start of purging, but the groundwater turbidity is

below the goal of 50 NTU and the values for all other parameters are within 10%, the well can be sampled. If the parameters have stabilized but the turbidity is not in the range of the 50 NTU goal, the pump flow rate should be decreased to a minimum rate of 100 mL/min to reduce turbidity levels as low as possible. Dissolved oxygen is extremely susceptible to various external influences (including temperature or the presence of bubbles on the DO meter); care should be taken to minimize the agitation or other disturbance of water within the flow-through cell while collecting these measurements. If air bubbles are present on the DO probe or in the discharge tubing, remove them before taking a measurement. If dissolved oxygen values are not within acceptable range for the temperature of groundwater (Attachment 1), then again check for and remove air bubbles on probe before re-measuring. If the dissolved oxygen value is 0.00 or less, then the meter should be serviced and re-calibrated. If the dissolved oxygen values are above possible results, then the meter should be serviced and re-calibrated.

During extreme weather conditions, stabilization of field indicator parameters may be difficult to obtain. Modifications to the sampling procedures to alleviate these conditions (e.g., measuring the water temperature in the well adjacent to the pump intake) will be documented in the field notes. If other field conditions exist that preclude stabilization of certain parameters, an explanation of why the parameters did not stabilize will also be documented in the field logbook.

7. Complete the sample label(s) and cover the label(s) with clear packing tape to secure the label onto the container.

8. After the indicator parameters have stabilized, collect groundwater samples by diverting flow out of the unfiltered discharge tubing into the appropriate labeled sample container. If a flow-through analytical cell is being used to measure field parameters, the flow-through cell should be disconnected after stabilization of the field indicator parameters and prior to groundwater sample collection. Under no circumstances should analytical samples be collected from the discharge of the flow-through cell. When the container is full, tightly screw on the cap. Samples should be collected in the following order: VOCs, TOC, SVOCs, metals and cyanide, and others (or other order as defined in the site-specific Work Plan).

9. If sampling for total and filtered metals and/or PCBs, a filtered and unfiltered sample will be collected. Install an in-line, disposable 0.45-micron particle filter on the discharge tubing after the appropriate unfiltered groundwater sample has been collected. Continue to run the pump until an initial volume of “flush” water has been run through the filter in accordance with the manufacturer’s directions (generally 100 to 300 mL). Collect filtered groundwater sample by diverting flow

out of the filter into the appropriately labeled sample container. When the container is full, tightly screw on the cap.

10. Secure with packing material and store at 4°C in an insulated transport container provided by the laboratory.

11. Record on the groundwater sampling log or bound field logbook the time sampling procedures were completed, any pertinent observations of the sample (e.g., physical appearance, and the presence or lack of odors or sheens), and the values of the stabilized field indicator parameters as measured during the final reading during purging (Attachment 2 – Example Sampling Log).

12. Turn off the pump and air compressor or close the gas cylinder valve if using a bladder pump set-up. Slowly remove the pump, tubing, lines, and safety cable from the well. Do not allow the tubing or lines to touch the ground or any other surfaces which could contaminate them. .

13. If tubing is to be dedicated to a well, it should be folded to a length that will allow the well to be capped and also facilitate retrieval of the tubing during later sampling events. A length of rope or string should be used to tie the tubing to the well cap. Alternatively, if tubing and safety line are to be saved and reused for sampling the well at a later date they may be coiled neatly and placed in a clean plastic bag that is clearly labeled with the well ID. Make sure the bag is tightly sealed before placing it in storage.

14. Secure the well and properly dispose of personal protective equipment (PPE) and disposable equipment.

15. Complete the procedures for packaging, shipping, and handling with associated chain-of-custody.

16. Complete decontamination procedures for flow-through analytical cell and submersible or bladder pump, as appropriate.

17. At the end of the day, perform calibration check of field instruments.

If it is not technically feasible to use the low-flow sampling method, purging and sampling of monitoring wells may be conducted using the bailer method as outlined below:

1. Don appropriate PPE (as required by the HASP).

2. Place plastic sheeting around the well.

3. Clean sampling equipment.

4. Open the well cover while standing upwind of the well. Remove well cap and place on the plastic sheeting. Insert PID probe approximately 4 to 6 inches into the casing or the well headspace and cover with gloved hand. Record the PID reading in the field log. If the well headspace reading is less than 5 PID units, proceed; if the headspace reading is greater than 5 PID units, screen the air within the breathing zone. If the breathing zone reading is less than 5 PID units, proceed. If the PID reading in the breathing zone is above 5 PID units, move upwind from well for 5 minutes to allow the volatiles to dissipate. Repeat the breathing zone test. If the reading is still above 5 PID units, don appropriate respiratory protection in accordance with the requirements of the HASP. Record all PID readings. For wells that are part of the regular weekly monitoring program and prior PID measurements have not resulted in a breathing zone reading above 5 PID units, PID measurements will be taken monthly.

5. Measure the depth to water and determine depth of well by examining drilling log data or by direct measurement. Calculate the volume of water in the well (in gallons) by using the length of the water column (in feet), multiplying by 0.163 for a 2-inch well or by 0.653 for a 4-inch well. For other well diameters, use the formula:

   Volume (in gallons) = π TIMES well radius (in feet) squared TIMES length of water column (in feet) TIMES 7.481 (gallons per cubic foot)

6. Measure a length of rope or twine at least 10 feet greater than the total depth of the well. Secure one end of the rope to the well casing and secure the other end to the bailer. Test the knots and make sure the rope will not loosen. Check bailers so that all parts are intact and will not be lost in the well.

7. Lower bailer into well and remove one well volume of water. Contain all water in appropriate containers.

8. Monitor the field indicator parameters (e.g., turbidity, temperature, specific conductance, and pH). Measure field indicator parameters using a clean container such as a glass beaker or sampling cups provided with the instrument. Record field indicator parameters on the groundwater sampling log.

9. Repeat Steps 7 and 8 until three or four well volumes have been removed. Examine the field indicator parameter data to determine if the parameters have stabilized. The well is considered stabilized and ready for sample collection when turbidity values remain within 10% (or within 1 NTU if the turbidity reading is less than 10 NTU), the specific conductance and temperature values remain

within 3%, and pH remains within 0.1 units for three consecutive readings collected once per well volume removed.

10. If the field indicator parameters have not stabilized, remove a maximum of five well volumes prior to sample collection. Alternatively, five well volumes may be removed without measuring the field indicator parameters.

11. If the recharge rate of the well is very low, wells screened across the water table may be bailed dry and sampling should commence as soon as the volume in the well has recovered sufficiently to permit collection of samples. For wells screened entirely below the water table, the well should only be bailed down to a level slightly higher than the bentonite seal above the well screen. The well should not be bailed completely dry, to maintain the integrity of the seal. Sampling should commence as soon as the well volume has recovered sufficiently to permit sample collection.

12. Following purging, allow water level in well to recharge to a sufficient level to permit sample collection.

13. Complete the sample label and cover the label with clear packing tape to secure the label onto the container.

14. Slowly lower the bailer into the screened portion of the well and carefully retrieve a filled bailer from the well causing minimal disturbance to the water and any sediment in the well.

15. The sample collection order (as appropriate) will be as follows:

    a. VOCs;

    b TOC;

    c. SVOCs;

    d. metals and cyanide; and

    e. others.

16. When sampling for volatiles, collect water samples directly from the bailer into 40-mL vials with Teflon®-lined septa.

17. For other analytical samples, remove the cap from the large glass mixing container and slowly empty the bailer into the large glass mixing container. The

sample for dissolved metals and/or filtered PCBs should either be placed directly from the bailer into a pressure filter apparatus or pumped directly from the bailer with a peristaltic pump, through an in-line filter, into the pre-preserved sample bottle.

18. Continue collecting samples until the mixing container contains a sufficient volume for all laboratory samples.

19. Mix the entire sample volume with the Teflon® stirring rod and transfer the appropriate volume into the laboratory jar(s). Secure the sample jar cap(s) tightly.

20. If sampling for total and filtered metals and/or PCBs, a filtered and unfiltered sample will be collected. Sample filtration for the filtered sample will be performed in the field using a peristaltic pump prior to preservation. Install new medical-grade silicone tubing in the pump head. Place new Teflon® tubing into the sample mixing container and attach to the intake side of pump tubing. Attach (clamp) a new 0.45-micron filter (note the filter flow direction). Turn the pump on and dispense the filtered liquid directly into the laboratory sample bottles.

21. Secure with packing material and store at 4°C in an insulated transport container provided by the laboratory.

22. After sample containers have been filled, remove one additional volume of groundwater. Measure the pH, temperature, turbidity, and conductivity. Record on the groundwater sampling log or bound field logbook the time sampling procedures were completed, any pertinent observations of the sample (e.g., physical appearance, and the presence or lack of odors or sheens), and the values of the field indicator parameters.

23. Remove bailer from well, secure well, and properly dispose of PPE and disposable equipment.

24. If a bailer is to be dedicated to a well, it should be secured inside the well above the water table, if possible. Dedicated bailers should be tied to the well cap so that inadvertent loss of the bailer will not occur when the well is opened.

25. Complete the procedures for packaging, shipping, and handling with associated chain-of-custody.

VII. Waste Management

Materials generated during groundwater sampling activities, including disposable equipment, will be placed in appropriate containers. Containerized waste will be disposed of by the client consistent with the procedures identified in the HASP.

VIII. Data Recording and Management

Initial field logs and chain-of-custody records will be transmitted to the ARCADIS PM at the end of each day unless otherwise directed by the PM. The groundwater team leader retains copies of the groundwater sampling logs.

IX. Quality Assurance

In addition to the quality control samples to be collected in accordance with this SOP, the following quality control procedures should be observed in the field:

- Collect samples from monitoring wells in order of increasing concentration, to the extent known based on review of historical site information if available.
- Equipment blanks should include the pump and tubing (if using disposable tubing) or the pump only (if using tubing dedicated to each well).
- Collect equipment blanks after wells with higher concentrations (if known) have been sampled.
- Operate all monitoring instrumentation in accordance with manufacturer's instructions and calibration procedures. Calibrate instruments at the beginning of each day and verify the calibration at the end of each day. Record all calibration activities in the field notebook.
- Clean all groundwater sampling equipment prior to use in the first well and after each subsequent well using procedures for equipment decontamination.

Chain-of-Custody, Handling, Packing and Shipping

Rev. #: 2

Rev Date: March 6, 2009

Approval Signatures

Prepared by: _____ Date: 3/6/09
Caron Koll

Reviewed by: _____ Date: 3/6/09
Jane Kennedy(Technical Expert)

I. Scope and Application

This Standard Operating Procedure (SOP) describes the chain-of-custody, handling, packing, and shipping procedures for the management of samples to decrease the potential for cross-contamination, tampering, mis-identification, and breakage, and to insure that samples are maintained in a controlled environment from the time of collection until receipt by the analytical laboratory.

II. Personnel Qualifications

ARCADIS field sampling personnel will have current health and safety training, including 40-hour HAZWOPER training, Department of Transportation (DOT) training, site supervisor training, and site-specific training, as needed. In addition, ARCADIS field sampling personnel will be versed in the relevant SOPs and possess the skills and experience necessary to successfully complete the desired field work.

III. Equipment List

The following list provides materials that may be required for each project. Project documents and sample collection requirements should be reviewed prior to initiating field operations:

- indelible ink pens (black or blue);
- polyethylene bags (resealable-type);
- clear packing tape, strapping tape, duct tape;
- chain of custody
- DOT shipping forms, as applicable
- custody seals or tape;
- appropriate sample containers and labels,;
- insulated coolers of adequate size for samples and sufficient ice to maintain 4°C during collection and transfer of samples;
- wet ice;
- cushioning and absorbent material (i.e., bubble wrap or bags);

- temperature blank
- sample return shipping papers and addresses; and
- field notebook.

IV. Cautions

Review project requirements and select appropriate supplies prior to field mobilization.

Insure that appropriate sample containers with applicable preservatives, coolers, and packing material have been supplied by the laboratory.

Understand the offsite transfer requirements for the facility at which samples are collected.

If overnight courier service is required schedule pick-up or know where the drop-off service center is located and the hours of operation. Prior to using air transportation, confirm air shipment is acceptable under DOT and International Air Transport Association (IATA) regulation

Schedule pick-up time for laboratory courier or know location of laboratory/service center and hours of operation.

Understand DOT and IATA shipping requirements and evaluate dangerous goods shipping regulations relative to the samples being collected (i.e. complete an ARCADIS shipping determination). Review the ARCADIS SOPs for shipping, packaging and labeling of dangerous goods. Potential samples requiring compliance with this DOT regulation include:

- Methanol preservation for Volatile Organic Compounds in soil samples
- Non-aqueous phase liquids (NAPL)

V. Health and Safety Considerations

Follow health and safety procedures outlined in the project/site Health and Safety Plan (HASP).

Use caution and appropriate cut resistant gloves when tightening lids to 40 mL vials. These vials can break while tightening and can lacerate hand. Amber vials (thinner glass) are more prone to breakage.

Some sample containers contain preservatives.

- The preservatives must be retained in the sample container and should in no instance be rinsed out.
- Preservatives may be corrosive and standard care should be exercised to reduce potential contact to personnel skin or clothing. Follow project safety procedures if spillage is observed.
- If sample container caps are broken discard the bottle. Do not use for sample collection.

VI. Procedure

Chain-of-Custody Procedures

1. Prior to collecting samples, complete the chain-of-custody record header information by filling in the project number, project name, and the name(s) of the sampling technician(s) and other relevant project information. Attachment 1 provides an example chain-o- custody record

2. Chain-of-custody information MUST be printed legibly using indelible ink (black or blue).

3. After sample collection, enter the individual sample information on the chain-of-custody:

    a. Sample Identification indicates the well number or soil location that the sample was collected from. Appropriate values for this field include well locations, grid points, or soil boring identification numbers (e.g., MW-3, X-20, SB-30). When the depth interval is included, the complete sample ID would be “SB-30 (0.5-1.0) where the depth interval is in feet. Please note it is very important that the use of hyphens in sample names and depth units (i.e., feet or inches) remain consistent for all samples entered on the chain-of-custody form. DO NOT use the apostrophe or quotes in the sample ID. Sample names may also use the abbreviations “FB,” “TB,” and “DUP” as prefixes or suffixes to indicate that the sample is a field blank, trip blank, or field duplicate, respectively. NOTE: The sample

nomenclature may be dictated by the project database and require unique identification for each sample collected for the project. Consult the project data management plan for additional information regarding sample identification.

b. List the date of sample collection. The date format to be followed should be mm/dd/yy (e.g., 03/07/09) or mm/dd/yyyy (e.g. 03/07/2009).

c. List the time that the sample was collected. The time value should be presented using military format. For example, 3:15 P.M. should be entered as 15:15.

d. The composite field should be checked if the sample is a composite over a period of time or from several different locations and mixed prior to placing in sample containers.

e. The “Grab”. field should be marked with an “X” if the sample was collected as an individual grab sample. (e.g. monitoring well sample or soil interval).

f. Any sample preservation should be noted.

g. The analytical parameters that the samples are being analyzed for should be written legibly on the diagonal lines. As much detail as possible should be presented to allow the analytical laboratory to properly analyze the samples. For example, polychlorinated biphenyl (PCB) analyses may be represented by entering “PCBs” or “Method 8082.” Multiple methods and/or analytical parameters may be combined for each column (e.g., PCBs/VOCs/SVOCs or 8082/8260/8270). These columns should also be used to present project-specific parameter lists (e.g., Appendix IX+3 target analyte list. Each sample that requires a particular parameter analysis will be identified by placing the number of containers in the appropriate analytical parameter column. For metals in particular, indicate which metals are required.

h. Number of containers for each method requested. This information may be included under the parameter or as a total for the sample based on the chain of custody form used.

i. Note which samples should be used for site specific matrix spikes.

j. Indicate any special project requirements.

k. Indicate turnaround time required.

l. Provide contact name and phone number in the event that problems are encountered when samples are received at the laboratory.

m. If available attach the Laboratory Task Order or Work Authorization forms

n. The remarks field should be used to communicate special analytical requirements to the laboratory. These requirements may be on a per sample basis such as “extract and hold sample until notified,” or may be used to inform the laboratory of special reporting requirements for the entire sample delivery group (SDG). Reporting requirements that should be specified in the remarks column include: 1) turnaround time; 2) contact and address where data reports should be sent; 3) name of laboratory project manager; and 4) type of sample preservation used.

o. The “Relinquished By” field should contain the signature of the sampling technician who relinquished custody of the samples to the shipping courier or the analytical laboratory.

p. The “Date” field following the signature block indicates the date the samples were relinquished. The date format should be mm/dd/yyyy (e.g., 03/07/2005).

q. The “Time” field following the signature block indicates the time that the samples were relinquished. The time value should be presented using military format. For example, 3:15 P.M. should be entered as 15:15.

r. The “Received By” section is signed by sample courier or laboratory representative who received the samples from the sampling technician or it is signed upon laboratory receipt from the overnight courier service.

3. Complete as many chain-of-custody forms as necessary to properly document the collection and transfer of the samples to the analytical laboratory.

4. Upon completing the chain-of-custody forms, forward two copies to the analytical laboratory and retain one copy for the field records.

5. If electronic chain-of-custody forms are utilized, sign the form and make 1 copy for ARCADIS internal records and forward the original with the samples to the laboratory.

Handling Procedures

1. After completing the sample collection procedures, record the following information in the field notebook with indelible ink:

   - project number and site name;
   - sample identification code and other sample identification information, if appropriate;
   - sampling method;
   - date;
   - name of sampler(s);
   - time;
   - location (project reference);
   - location of field duplicates and both sample identifications;
   - locations that field QC samples were collected including equipment blanks, field blanks and additional sample volume for matrix spikes; and
   - any comments.

2. Complete the sample label with the following information in indelible ink:

   - sample type (e.g., surface water);
   - sample identification code and other sample identification information, if applicable;
   - analysis required;
   - date;
   - time sampled; and
   - initials of sampling personnel;

- sample matrix; and
- preservative added, if applicable.

3. Cover the label with clear packing tape to secure the label onto the container and to protect the label from liquid.

4. Confirm that all caps on the sample containers are secure and tightly closed.

5. In some instances it may be necessary to wrap the sample container cap with clear packing tape to prevent it from becoming loose.

6. For some projects individual custody seals may be required. Custody seal evidence tape may be placed on the shipping container or they may be placed on each sample container such that the cooler or cap cannot be opened without breaking the custody seal. The custody seal should be initialed and dated prior to relinquishing the samples.

Packing Procedures

Following collection, samples must be placed on wet ice to initiate cooling to 4°C immediately. Retain samples on ice until ready to pack for shipment to the laboratory.

1. Secure the outside and inside of the drain plug at the bottom of the cooler being used for sample transport with “Duct” tape.

2. Place a new large heavy duty plastic garbage bag inside each cooler

3. Place each sample bottle wrapped in bubble wrap inside the garbage bag. VOC vials may be grouped by sample in individual resealable plastic bags). If a cooler temperature blank is supplied by the laboratory, it should be packaged following the same procedures as the samples. If the laboratory did not include a temperature blank, do not add one. Place 1 to 2 inches of cushioning material (i.e., vermiculite) at the bottom of the cooler.

4. Place the sealed sample containers upright in the cooler.

5. Package ice in large resealable plastic bags and place inside the large garbage bag in the cooler. Samples placed on ice will be cooled to and maintained at a temperature of approximately 4°C.

6. Fill the remaining space in the cooler with cushioning material such as bubble wrap. The cooler must be securely packed and cushioned in an upright position and be surrounded (Note: to comply with 49 CFR 173.4, filled cooler must not exceed 64 pounds).

7. Place the completed chain-of-custody record(s) in a large resealable bag and tape the bag to the inside of the cooler lid.

8. Close the lid of the cooler and fasten with packing tape.

9. Wrap strapping tape around both ends of the cooler.

10. Mark the cooler on the outside with the following information: shipping address, return address, “Fragile, Handle with Care” labels on the top and on one side, and arrows indicating “This Side Up” on two adjacent sides.

11. Place custody seal evidence tape over front right and back left of the cooler lid, initial and date, then cover with clear plastic tape.

Note: Procedure numbers 2, 3, 5, and 6 may be modified in cases where laboratories provide customized shipping coolers. These cooler types are designed so the sample bottles and ice packs fit snugly within preformed styrofoam cushioning and insulating packing material.

Shipping Procedures

1. All samples will be delivered by an express carrier within 48 hours of sample collection. Alternatively, samples may be delivered directly to the laboratory or laboratory service center or a laboratory courier may be used for sample pickup.

2. If parameters with short holding times are required (e.g., VOCs [EnCore™ Sampler], nitrate, nitrite, ortho-phosphate and BOD), sampling personnel will take precautions to ship or deliver samples to the laboratory so that the holding times will not be exceeded.

3. Samples must be maintained at 4°C±2°C until shipment and through receipt at the laboratory

4. All shipments must be in accordance with DOT regulations and ARCADIS dangerous goods shipping SOPs.

5. When the samples are received by the laboratory, laboratory personnel will complete the chain-of-custody by recording the date and time of receipt of samples, measuring and recording the internal temperature of the shipping container, and checking the sample identification numbers on the containers to ensure they correspond with the chain-of-custody forms.

Any deviations between the chain-of-custody and the sample containers, broken containers, or temperature excursions will be communicated to ARCADIS immediately by the laboratory.

VII. Waste Management

Not applicable

VIII. Data Recording and Management

Chain-of-custody records will be transmitted to the ARCADIS PM or designee at the end of each day unless otherwise directed by the ARCADIS PM. The sampling team leader retains copies of the chain-of-custody forms for filing in . the project file. Record retention shall be in accordance with project requirements.

IX. Quality Assurance

Chain-of-custody forms will be legibly completed in accordance with the applicable project documents such as Sampling and Analysis Plan (SAP), Quality Assurance Project Plan (QAPP), Work Plan, or other project guidance documents. A copy of the completed chain-of-custody form will be sent to the ARCADIS Project Manager or designee for review.

Investigation-Derived Waste Handling and Storage

Rev. #: 2

Rev Date: March 6, 2009

Approval Signatures

Prepared by: Andrew Kamik Date: 3/6/09

Reviewed by: Liz Marsh Date: 3/6/09
(Technical Expert)

I. Scope and Application

The objective of this Standard Operating Procedure (SOP) is to describe the procedures to manage investigation-derived wastes (IDW), both hazardous and non-hazardous, generated during site activities, which may include, but are not limited to - drilling, trenching/excavation, construction, demolition, monitoring well sampling, soil sampling, decontamination and remediation. Please note that this SOP is intended for materials that have been deemed a solid waste as defined by 40 CFR § 261.2 (which may includes liquids, solids, and sludges). In some cases, field determinations will be made based on field screening or previous data that materials are not considered a solid waste. IDW may include soil, groundwater, drilling fluids, decontamination liquids, personal protective equipment (PPE), sorbent materials, construction and demolition debris, and disposable sampling materials that may have come in contact with potentially impacted materials. IDW will be collected and staged at the point of generation. Quantities small enough to be containerized in 55-gallon drums will be taken to a designated temporary storage area (discussed in further detail under Drum Storage) onsite pending characterization and disposal. Waste materials will be analyzed for constituents of concern to evaluate proper disposal methods. PPE and disposable sampling equipment will be placed in DOT-approved drums prior to disposal and typically does not require laboratory analysis. This SOP describes the necessary equipment, field procedures, materials, regulatory references, and documentation procedures necessary for proper handling and storage of IDW up to the time it is properly disposed. The procedures for handling IDW are based on the United States Environmental Protection Agency's Guide to Management of Investigation Derived Wastes (USEPA, 1992). IDW is assumed to be contaminated with the site constituents of concern (COCs) until analytical evidence indicates otherwise. IDW will be managed to ensure the protection of human health and the environment and will comply with all applicable or relevant and appropriate requirements (ARAR). The following Laws and Regulations on Hazardous Waste Management are potential ARAR for this site.

State Laws and Regulations

- To Be Determined Based on Location of Site and Location of Treatment, Storage, and/or Disposal Facility (TSDF) to be utilized

Federal Laws and Regulations

- Resource Conservation and Recovery Act (RCRA) 42 USC § 6901-6987
- Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) 42 USC § 9601-9675

- Superfund Amendments and Reauthorization Act (SARA)
- Department of Transportation (DOT) Hazardous Materials Transportation

Pending characterization, IDW will be stored appropriately within each area of contamination (AOC). Under RCRA, "storage" is defined as the holding of hazardous waste for a temporary period, at the end of which the hazardous waste is treated, disposed of, or stored elsewhere" (40 CFR § 260.10). The onsite waste staging area will be in a secure and controlled area. Waste characterization can either be based on generator knowledge, such as using materials safety data sheets (MSDS'), or can be based upon analytical results. The laboratory used for waste characterization analysis must have the appropriate state and federal certifications and be approved by ARCADIS and Client. IDW will be classified as RCRA hazardous or non-regulated under RCRA based on the waste characterization.

If IDW is characterized as RCRA hazardous waste, RCRA and DOT requirements must be followed for packaging, labeling, transporting, storing, and record keeping as described in 40 CFR § 262 and 49 CFR § 171-178. Wastes judged to potentially meet the criteria for hazardous wastes shall be stored in DOT approved packaging. Waste material classified as RCRA non-hazardous may be handled and disposed of as an industrial waste.

Liquid wastes judged to potentially meet the criteria for hazardous wastes shall be stored in DOT approved 55 gallon drums or other approved containers that are compatible with the type of material stored therein. Solid materials deemed to potentially meet hazardous criteria will be drummed where practicable. Large quantities of potentially hazardous solid materials must be containerized (such as in a roll-off box) for up to a maximum of 90 or 180 days as described in the Excavated Solids Section. Waste material classified as non-hazardous may be handled and disposed of as an industrial waste and is not subject to the 90-day or 180-day on-site storage limitation.

This is a standard (i.e., typically applicable) operating procedure which may be varied or changed as required, dependent upon site conditions, equipment limitations, or limitations imposed by the procedure. The ultimate procedure employed will be documented in the project work plans or reports. If changes to the sampling procedures are required due to unanticipated field conditions, the changes will be discussed with the Project Manager and Client as soon as practicable and documented in the report.

II. Personnel Qualifications

ARCADIS field sampling personnel will have current health and safety training including 40-hour HAZWOPER training, site supervisor training, site-specific training, first aid, and CPR, as needed. ARCADIS personnel may sign manifests on a case-to-case basis for clients, provided the appropriate agreement is in place between ARCADIS and the client documenting that ARCADIS is not the generator, but is acting as authorized representative for the generator. ARCADIS personnel who sign hazardous waste manifests will have the current DOT hazardous materials transportation training according to 49 CFR § 172.704. ARCADIS field personnel will also comply with client-specific training such as LPS. In addition, ARCADIS field sampling personnel will be versed in the relevant SOPs and posses the required skills and experience necessary to successfully complete the desired field work.

III. Equipment List

The following materials, as required, shall be available for IDW handling and storage:

Appropriate personal protective equipment as specified in the Site Health and Safety Plan

- 55-gallon steel drums, DOT 1A2 or equivalent
- ¾ -inch socket wrench
- Hammer
- Leather gloves
- Drum dolly
- Appropriate drum labels (outdoor waterproof self adhesive)
- Polyethylene storage tank
- Appropriate labeling, packing, chain-of-custody forms, and shipping materials as specified in the *Chain-of-Custody* SOP and *Field Sampling Handling, Packing, and Shipping* SOP.
- Indelible ink and/or permanent marking pens
- Plastic sheeting

- Appropriate sample containers, labels, and forms
- Stainless-steel bucket auger
- Stainless steel spatula or knife
- Stainless steel hand spade
- Stainless steel scoop
- Digital camera
- Field logbook.

IV. Cautions

- Filled drums can be very heavy, always use appropriate moving techniques and equipment.
- Similar media will be stored in the same drums to aid in sample analysis and disposal.
- Drum lids must be secured to prevent rainwater from entering the drums.
- Drums containing solid material may not contain any free liquids.
- Waste containers stored for extended periods of time may be subject to deterioration. Drum over packs may be used as secondary containment.
- All drums must be in good condition to prevent potential leakage and facilitate subsequent disposal. Inspect the drums for dents and rust, and verify the drum has a secure lid prior to use.

V. Health and Safety Considerations

- Appropriate personal protective equipment must be worn by all field personnel within the designated work area.
- Air monitoring may be required during certain field activities as required in the Site Health and Safety Plan.

- If excavating in potentially hazardous areas is possible, contingency plans should be developed to address the potential for encountering gross contamination or non-aqueous phase liquids.

- ARCADIS field personnel will be familiar and compliant with Client-specific health and safety requirements such as Chevron's hand safety policy including the prohibition of fixed and/or folding blade knives.

VI. Procedure

Waste storage and handling procedures to be used depend upon the type of generated waste. For this reason, IDW should be stored in a secure location onsite in separate 55-gallon storage drums, solids can be stockpiled onsite (if non-hazardous), and purge water may be stored in polyethylene tanks. Waste materials such as broken sample bottles or equipment containers and wrappings will be stored in 55-gallon drums unless they were not in contact with sample media.

Management of IDW

Minimization of IDW should be considered by the Project Manager during all phases of the project. Site managers may want to consider techniques such as replacing solvent-based cleaners with aqueous-based cleaners for decontamination of equipment, reuse of equipment (where it can be decontaminated), limitation of traffic between exclusion and support zones, and drilling methods and sampling techniques that generate little waste. Alternative drilling and subsurface sampling methods may include the use of small diameter boreholes, as well as borehole testing methods such as a core penetrometer or direct push technique instead of coring (EPA, 1993).

Drum Storage

Drums containing hazardous waste shall be stored in accordance with the requirements of 40 CFR 265 Subpart I (for containers) and 265 Subpart DD (for containment buildings). All 55-gallon drums will be stored at a secure, centralized on-site location that is readily accessible for vehicular pick-up. Drums confirmed as, or believed to contain hazardous waste will be stored over an impervious surface provided with secondary containment. The storage location will, for drums containing liquid, have a containment system that can contain at least the larger of 10% of the aggregate volume of staged materials or 100% of the volume of the largest container. Drums will be closed during storage and be in good condition in accordance with the Guide to Management of Investigation-Derived Wastes (USEPA, 1992).

Hazardous Waste Determination

Waste material must be characterized to determine if it meets any of the federal definitions of hazardous waste as required by 40 CFR § 262.11. If the waste does not meet any of the federal definitions, it must then be established if any state-specific hazardous waste criteria exist/apply.

Generator Status

Once hazardous waste determination has been made, the generator status will be determined. Large quantity generators (LQG) are generators who generate more than 1,000 kilograms of hazardous waste in a calendar month. Small quantity generators (SQG) of hazardous waste are generators who generate greater than 100 kilograms but less than 1,000 kilograms of hazardous waste in a calendar month. Conditionally exempt small quantity generators (CESQG) are generators who generate less than 100 kilograms of hazardous waste per month. Please note that a generator status may change from month to month and that a notice of this change is usually required by the generator's state agency.

Accumulation Time for Hazardous Waste

A LQG may accumulate hazardous waste on site for 90 days or less without a permit and without having interim status provided that such accumulation is in compliance with specifications in 40 CFR § 262.34. A SQG may accumulate hazardous waste on site for 180 days or less without a permit or without having interim status subject to the requirements of 40 CFR § 262.34(d). CESQG requirements are found in 40 CFR § 261.5. **NOTE**: The CESQG and SQG provisions of 40 CFR § 261.5, 262.20(e), 262.42(b) and 262.44 may not be recognized by some states (e.g. Rhode Island). **State-specific regulations must be reviewed and understood prior to the generation of hazardous waste.**

Satellite Accumulation of Hazardous Waste

Satellite accumulation (SAA) shall mean the accumulation of as much as fifty-five (55) gallons of hazardous waste, or the accumulation of as much as one quart of acutely hazardous waste, in containers at or near any point of generation where the waste initially accumulates, which is under the control of the operator of the process generating the waste, without a permit or interim status and without complying with the requirements of 40 CFR § 262.34(a) and without any storage time limit, provided that the generator complies with 40 CFR § 262.34(c)(1)(i).

Once more than 55 gallons of hazardous waste accumulates in SAA, the generator has three days to move this waste into storage.

Storage recommendations for hazardous waste include:

- Ignitable Hazardous wastes must be >50 feet from the property line per 40 CFR § 265.176 (LQG generators only).
- Hazardous waste must be stored on a concrete slab (asphalt is acceptable if there are no free liquids in the waste) per 40 CFR § 265.176.
- Drainage must be directed away from the accumulation area.
- Area must be properly vented.
- Area must be secure.

Drum/Container Labeling

Drums will be labeled on both the side and lid of the drum using a permanent marking pen. Old drum labels must be removed to the extent possible, descriptions crossed out should any information remain, and new labels affixed on top of the old labels. Other containers used to store various types of waste (polyethylene tanks, roll-off boxes, end-dump trailers, etc.) will be labeled with an appropriate "Waste Container" or “Testing in Progress” label pending characterization. Drums and containers will be labeled as follows:

- Appropriate waste characterization label (Testing In Progress, Hazardous, or Non-Hazardous)
- Waste generator's name (e.g., client name)
- Project name
- Name and telephone number of ARCADIS project manager
- Composition of contents (e.g., used oil, acetone 40%, toluene 60%)
- Media (e.g., solid, liquid)
- Accumulation start date

- Drum number of total drums as reconciled with the Drum Inventory maintained in the field log book.

IDW containers will remain closed except when adding or removing waste. Immediately upon beginning to place waste into the drum/container, a “Waste Container” or “Testing in Progress” label will be filled out to include the information specified above, and affixed to the container. Once the contents of the container are identified as either non-hazardous or hazardous, the following additional labels will be applied. Containers with waste determined to be non-hazardous will be labeled with a green and white "Non-Hazardous Waste" label over the "Waste Container" label. Containers with waste determined to be hazardous will be stored in an onsite storage area and will be labeled with the "Hazardous Waste" label and affixed over the "Waste Container" label. The ACCUMULATION DATE for the hazardous waste is the date the waste is first placed in the container and is the same date as the date on the "Waste Container" label. DOT hazardous class labels must be applied to all hazardous waste containers for shipment offsite to an approved disposal or recycling facility. In addition a DOT proper shipping name shall be included on the hazardous waste label. The transporter should be equipped with the appropriate DOT placards. However, placarding or offering placards to the initial transporter is the responsibility of the generator per 40 CFR § 262.33.

Inspections and Documentation

All IDW will be documented as generated on a Drum Inventory Log maintained in the field log book. The Drum Inventory will record the generation date, type, quantity, matrix and origin (e.g. Boring-1, Test Pit 3, etc) of materials in every drum, as well as a unique identification number for each drum. The drum inventory will be used during drum pickup to assist with labeling of drums. The drum storage area and any other areas of temporarily staged waste, such as soil/debris piles, will be inspected weekly. The weekly inspections will be recorded in the field notebook or on a Weekly Inspection Log. Digital photographs will be taken upon the initial generation and drumming/staging of waste, and final labeling after characterization to document compliance with labeling and storage protocols, and condition of the container. Evidence of damage, tampering or other discrepancy should be documented photographically.

Emergency Response and Notifications

Specific procedures for responding to site emergencies will be detailed in the HASP. If the generator is designated as a LQG, a Contingency Plan will need to be prepared to include emergency response and notification procedures per 40 CFR § 265 Subpart D. In the event of a fire, explosion, or other release which could threaten human health

outside of the site or when Client or ARCADIS has knowledge of a spill that has reached surface water, Client or ARCADIS must immediately notify the National Response Center (800-424-8802) in accordance with 40 CFR § 262.34. Other notifications to state agencies may also be necessary.

Drilling Soil Cuttings and Muds

Soil cuttings are solid to semi-solid soils generated during trenching activities, subsurface soil sampling, or installation of monitoring wells. Depending on the drilling method, drilling fluids known as "muds" may be used to remove soil cuttings. Drilling fluids flushed from the borehole must be directed into a settling section of a mud pit. This allows reuse of the decanted fluids after removal of the settled sediments. Soil cuttings will be labeled and stored in 55-gallon drums with bolt-sealed lids.

Excavated Solids

Excavated solids may include, but are not limited to soil, fill and construction and demolition debris. Excavated solids may be temporarily stockpiled onsite as long as the material is a RCRA non-hazardous waste and the solids will be treated onsite pursuant to a certified, authorized, or permitted treatment method, or properly disposed off-site. Stockpiled materials characterized as hazardous must be immediately containerized and removed from the site within 90 days of generation (except for soils using satellite accumulation). Excavated solids should be stockpiled and maintained in a secure area onsite. At a minimum, the floor of the stockpile area will be covered with a 20-mil high density polyethylene liner that is supported by a foundation or at least a 60-mil high density polyethylene liner that is not supported by a foundation. The excavated material will not contain free liquids. The owner/operator will provide controls for windblown dispersion, run-on control, and precipitation runoff. The run-on control system will prevent flow onto the active portion of the pile during peak discharge from at least a 25-year storm and the run-off management system will collect and control at least the water volume resulting from a 24-hour, 25-year storm (EPA, 1992). Additionally, the stockpile area will be inspected on a weekly basis and after storm events. Individual states may require that the stockpile be inspected/certified by a licensed professional engineer. Stockpiled material will be covered with a 6-mil polyvinyl chloride (PVC) liner. The stockpile cover will be secured in place with appropriate material (concrete blocks, weights, etc.) to prevent the movement of the cover. Excavated solids may also be placed in roll off containers and covered with a 6-mil PVC liner pending results for waste characterization.

Decontamination Solutions

Decontamination solutions are generated during the decontamination of personal protective equipment and sampling equipment. Decontamination solutions may range from detergents, organic solvents and acids used to decontaminate small field sampling equipment to steam cleaning rinsate used to wash heavy field equipment. These solutions are to be labeled and stored in 55-gallon drums with bolt-sealed lids.

Disposable Equipment

Disposable equipment includes personal protective equipment (tyvek coveralls, gloves, booties and APR cartridges) and disposable sampling equipment such as trowels or disposable bailers. If the media sampled exhibits hazardous characteristics per results of waste characterization sampling, disposable equipment will also be disposed of as a hazardous waste. These materials will be stored onsite in labeled 55-gallon drums pending analytical results for waste characterization.

Purge Water

Purge water includes groundwater generated during well development, groundwater sampling, or aquifer testing. The volume of groundwater generated will dictate the appropriate storage procedure. Monitoring well development and groundwater sampling may generate three well volumes of groundwater or more. This volume will be stored in labeled 55-gallon drums. Aquifer tests may generate significantly greater volumes of groundwater depending on the well yield and the duration of the test. Therefore, large-volume portable polyethylene tanks will be considered for temporary storage pending groundwater-waste characterization.

Purged Water Storage Tank Decontamination and Removal

The following procedures will be used for inspection, cleaning, and offsite removal of storage tanks used for temporary storage of purge water. These procedures are intended to be used for rented portable tanks such as Baker Tanks or Rain for Rent containers. Storage tanks will be made of inert polyethylene materials.

The major steps for preparing a rented tank for return to a vendor include characterizing the purge water, disposing of the purge water, decontaminating the tank, final tank inspection, and mobilization. Decontamination and inspection procedures are describe in further detail below.

- Tank Cleaning: Most vendors require that tanks be free of any sediment and water before returning, a professional cleaning service may be required. Each

specific vendor should be consulted concerning specific requirements for returning tanks.

- Tank Inspection: After emptying the tank, purged water storage tanks should be inspected for debris, chemical staining, and physical damage. The vendors require that tanks be returned in the original condition (i.e., free of sediment, staining and no physical damage).

VII. Waste Characterization Sampling and Shipping

Soil/Solids Characterization

Waste characterization will be conducted in accordance with waste hauler, waste handling facility, and state/federal requirements. In general, RCRA hazardous wastes are those solid wastes determined by a Toxicity Characteristic Leaching Procedure (TCLP) test or to contain levels of certain toxic metals, pesticides, or other organic chemicals above specific federally regulated thresholds. If the one or more of 40 toxic compounds listed in Table I of 40 CFR § 261.24 are detected in the sample at levels above the maximum unregulated concentrations, the waste must be characterized as a toxic hazardous waste. Wastes can also be considered “listed” hazardous waste depending on site-specific processes.

Composite soil samples will be collected at a frequency of one sample per 10 cubic yard basis for stockpiled soil or one per 55-gallon drum for containerized. A four point composite sample will be collected per 10 cubic yards of stockpiled material and for each drum. Sample and composite frequencies may be adjusted in accordance with the waste handling facility’s requirements. Waste characterization samples may be analyzed for the TCLP volatile organic compounds (VOCs), TCLP semi-volatile organic compounds (SVOCs), TCLP RCRA metals, and polychlorinated biphenyls, as well as corrosivity (pH), reactivity and flammability (flashpoint). Additional samples may be collected and analyzed by the laboratory on a contingency basis.

Wastewater Characterization

Waste characterization will be conducted in accordance with the requirements of the waste hauler, waste handling facility, and state/federal governments. In general, purge water should be analyzed by methods appropriate for the known contaminants, if any, that have been historically detected in the monitoring wells. Samples will be collected and analyzed in accordance with the requirements of the waste disposal facility.

Wastewater characterization samples may be analyzed for TCLP volatile organic compounds (VOCs), TCLP semi-volatile organic compounds (SVOCs), TCLP RCRA

metals, and polychlorinated biphenyls, as well as corrosivity (pH), reactivity and flammability (flashpoint). Additional samples may be collected and analyzed by the laboratory on a contingency basis.

Sample Handling and Shipping

All samples will be appropriately labeled, packed, and shipped, and the chain-of-custody will be filled out in accordance with the Chain-of-Custody SOP and Field Sampling Handling, Packing, and Shipping SOP and Hazardous Materials Packaging and Shipping SOP.

It should be noted that additional training is required for packaging and shipping of hazardous and/or dangerous materials. Please reference the following ARCADIS intranet team page for more information: http://team/sites/hazmat/default.aspx.

Preparing Waste Shipment Documentation (Hazardous and Non-Hazardous)

Waste profiles will be prepared by the ARCADIS PM and forwarded, along with laboratory analytical data to the Client PM for approval/signature. The Client PM will then return the profile to ARCADIS who will then forward to the waste removal contractor for preparation of a manifest. The manifest will be reviewed by ARCADIS prior to forwarding to the Client PM for approval. Upon approval of the manifest, the Client PM will return the original signed manifest directly to the waste contractor or to the ARCADIS PM for forwarding to the waste contractor.

Final drum labeling and pickup will be supervised by an ARCADIS representative who is experienced with waste labeling procedures. The ARCADIS representative will have a copy of the drum inventory maintained in the field book and will reconcile the drum inventory with the profile numbers on the labels and on the manifest. Different profile numbers will be generated for different matrices or materials in the drums. For example, the profile number for drill cuttings will be different than the profile number for purge water. **When there are multiple profiles it is critical that the proper label, with the profile number appropriate to a specific material be affixed to the proper drums.** A copy of the ARCADIS drum inventory will be provided to the waste transporter during drum pickup and to the facility receiving the waste.

VIII. Data Recording and Management

Waste characterization sample handling, packing, and shipping procedures will be documented in accordance with the *Quality Assurance Project Plan*, if one exists. Copies of the chains-of-custody forms will be maintained in the project file.

Following waste characterization, IDW containers will be re-labeled with the appropriate waste hazardous or non-hazardous waste labels and the client will initiate disposal at the appropriate waste disposal facility.

IX. Quality Assurance

The chain-of-custody and sample labels for waste characterization samples will be filled out in accordance with the *Quality Assurance Project Plan*.

				FILL		(6.7 - 10.0) SAND, yellowish brown (10YR 5/6), mostly medium grained, some very fine to fine, trace silt, well sorted, loose, trace fine to coarse gravel, subangular to subround, stone up to 2 inch diameter, wet		
10 / 800	48	0.5 - 2.5		FILL		(10.0 - 11.0) SAND, yellowish brown (10YR 5/6), mostly medium grained, some very fine to fine, little silt, well sorted, loose, little fine to coarse gravel, subangular to subround, stone up to 2 inch diameter, wet		
				SHALE		(11.0 - 14.0) SHALE, dark greenish gray (GLEY1 4/1), hard, brittle, mostly crushed pieces compacted to firm core, some fissile pieces, horizontal bedding, moist to dry		
15 / 795	72	0.1 - 0.3		LIMESTONE		(14.0 - 17.0) LIMESTONE, grayish brown (10YR 5/2), very hard, dense, cryptocrystalline, broken pieces, horizontal bedding/fracturing, some fossils, vuggy, secondary solution features/erosion, slightly micritic, wet (drill fluid)		
20 / 790	60	0.1		LIMESTONE		(17.0 - 28.0) LIMESTONE, light grayish brown (10YR 6/2) with gray (10YR 5/1), fossil specs, very hard, dense, cryptocrystalline, broken into pieces between 3 - 10 inches, very fossiliferous, mainly shell, vuggy, horizontal bedding/fracturing, secondary solution erosion/pitting, wet (drill fluids) to dry at core		
25 / 785	60	0.3 - 0.4		LIMESTONE		(28.0 - 30.0) LIMESTONE, dark gray (10YR 4/1), hard dense, broken angular pieces up to 2 inches, micritic, some fossils, wet (drill fluids)		
30 / 780	60	0.1 - 0.3		LIMESTONE		(30.0 - 35.0) LIMESTONE, dark gray (10YR 4/1) to grayish brown (10YR 5/2), hard, dense, cryptocrystalline, pieces up to 1 inch thick, fossils, soft, flow/deformational features, horizontal bedding/fracturing, some vugs, solution erosion, trace secondary calcite, worm tubes, wet (drill fluids) to dry at core		
35 / 775	0	--		NO RECOVERY		(35.0 - 40.0) No Recovery		
40 / 770				NO RECOVERY		(40.0 - 45.0) No Recovery. Limestone/sandstone contact depth unconfirmed.

APPENDIX I

Field Logs

7/25/07
ARCADIS: J. Dammel
Purpose: GW Sampling
Weather: 80s-90s, Sunny
0930: ARCADIS on-site, will begin to purge AMW-10 dry
0945: approx 6 gal bailed from AMW-10, well dry will go off site & return to take samples
1115 Sample's YSI AMW-10

Monday 13 August 2007
ARCADIS: J. Dammel
Purpose: soil samples, water levels
Weather: 70s, sunny

1000: ARCADIS on-site, ballparks
1030: took soil sample Alum-SS-001 (ASB049)
1045: took soil sample Alum-SS-002 (ASB051)
1050: took soil sample Alum-SS-003 (ASB-053)

1410 Gary P/U sample
1415 ~~ARCADIS~~ off-site

09/17/07 Monday p.1/1

purpose: Set up Surface Sampling and Soil Boring Locations; Surface Sampling

ARCADIS: T. Nelson-Kalmes, M. Meerkosen

Weather: Sunny, to Cloudy, 80's, Humid

0755 on-site, Begin SS and SB Locations

1045 Finish SS and SB Locations

1100 T. Nelson-Kalmes off-site

1110 M. Meerkosen; Lunch

1215 on-site, Begin Surface Sampling
AGM-SS-004 → 039

1730 Finish Surface Sampling
AGM-SS-004 → 039; All Samples Taken at 0-0.5'.

* Gary from Test America's Sample pick-up at 1530.
1735 off-site

purpose: GW Sampling
ARCADIS: M. Meerwien, T. Nelson, KALMES
WEATHER: Sunny 30's

0830 on-site

0835 Begin AMW-5B (pumping)
W.L Meter not working

0850 off-site

0940 on-site ~~AMW~~
Begin pumping AMW-5B
DTW = 32.31', purged ~ 25gal

Time	Temp	Cond	ORP	DO	pH	gal
0955	11.46	0.984	-134.2	1.47	6.86	5
1000	12.56	0.973	-140.3	1.03	6.69	10
1005	13.05	0.981	-143.4	0.82	6.64	15
1010	13.00	0.986	-143.3	0.89	6.67	20
1015	11.03	0.997	-183.5	1.21	6.60	25

1025 Sample AMW-5B & MS/MSD
VOC's, SVOC, PCB, RCRA Metals (Total & Field Filtered), Turbid, Lite Brown, Sulfer Smell

1100 Decon Grundfos, Empty Buckets

1120 Generator not working, stop at gas station for oil.

1215 Generator starts, Go to AMW-3B

1300 Begin pumping AMW-3B, Ball 5gal from AMW-3A
Purge/Ball ~ 17gal AMW-3A
Purged ~ 40gal AMW-3B
DTW = 100.66' AMW-3B
DTW = 17.53' AMW-3A

Time	Temp	Cond.	ORP	DO	pH	gal
1325	11.37	0.524	-183.9		7.62	5
1330	10.56	0.469	-184.2		7.24	10
1334	11.16	0.457	-191.8		7.16	15
1340	11.19	0.454	-206.9		7.12	20
1345	11.16	0.454	-207.7		7.11	25
1346	11.10	0.455	-207.8		7.10	30
1350	10.97	0.454	-207.9		7.10	35
1352	10.96	0.454	-207.9		7.11	37

1350 BEGIN SAMPLING AMW-3B, VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED); CLEAR, SULFER SMELL

1430 DECON GRUNFOS, EMPTY BUCKETS

1500 BEGIN SAMPLING EQUIPMENT BLANK EB-001 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

1540 WAIT FOR GARY FROM TEST AMERICA.

1630 GARY FROM TEST AMERICA CALLED. HE WILL MEET US AT ARCADIS FOR SAMPLE PICK-UP

1635 OFF-SITE

* SAMPLES PICKED UP AT ARCADIS AT 17:15 *

12/18/07 Tuesday p.1

purpose: GW Sampling
ARCADIS: M. Meerkosen
Weather: 20's, p. Cloudy

0730 pick-up ice

0740 on-site sign in, stop at Aristeo trailer for badge update. Does not recognize my name at Security

0800 Assess Sample Containers/ Sample Container Count

Still needed from Gary at Test America:

20 PCB
20 SVOC
22 RCRA Metals

Called Gary to inform

12/18/07 Tuesday p.2

0830 Begin Bailing AMW-3A
DTW = 17.45'
~12 gals to Bail

0905 Begin Sampling AMW-3A for VOC, SVOC, PCB, RCRA Metals (Total & Field Filtered), ~17 gal Bailed

* Duplicate Taken (Dup-001) *

Time	Temp	Cond	ORP	DO	pH	gal
0905	9.4	0.929	-91.1	4.84	7.15	17

1000 Finish Sampling AMW-3A, Slight odor, clear, black particles, clean-up, Empty Buckets

1055 AMW-4
DTW = 36.29' TD = 60.76'
Vol (gal) = 19.5 gal

1105 BEGIN BAILING AMW-4,
~19.5 gal

1137 FINISH BAILING AMW-4,
BAILED DRY, ~9 gal BAILED,
GO TO POLYTANK TO EMPTY
BUCKETS

1201 AMW-09
DTW = 77.69' TD = 89.26'
VOL (x5) = ~9.0 gal

1205 BEGIN BAILING AMW-09,
~9.0 gal

1225 FINISH BAILING AMW-09,
BAILED DRY, ~3.5 gal BAILED,
MOVE TO AMW-08

1238 AMW-08
DTW = 38.04' TD = 44.44'
VOL (x5) = ~5.0 gal

1245 BEGIN BAILING AMW-08,
~5.0 gal

1253 FINISH BAILING AMW-08,
BAILED DRY, ~2.3 gal BAILED,
MOVE TO AMW-01

1258 AMW-01
DTW = 26.39' TD = 41.61'
VOL (x5) = ~12.0 gal

1303 BEGIN BAILING AMW-01, ~12.0 gal
~~BAILED DRY, ~5.5 gal BAILED~~

1319 FINISH BAILING AMW-01, BAILED
DRY, ~5.5 gal BAILED, CLEAN UP,
GO TO POLYTANK TO EMPTY BUCKETS.

1330 AMW-06
DTW = 24.60' TD = 43.15'
VOL (x5) = ~13.0 gal

1400 FINISH BAILING AMW-06,
BAILED DRY, ~7.0 gal BAILED,
CLEAN-UP, GO TO POLYTANK TO
EMPTY BUCKETS

12/18/07 TUESDAY 5/

1405 GARY HERE FROM TEST AMERICA FOR SAMPLE CONTAINER DROP OFF.

1415 AMW-10
DTW = 20.30' TD = 42.21'
VOLUME (x5) = ~17.5 gal

1420 BEGIN BAILING AMW-10, ~17.5 gal

1437 FINISH BAILING AMW-10, BAILED DRY, ~8.0 gal BAILED, CLEAN-UP, MOVE TO AMW-02

0240 AMW-02
DTW = 25.28' TD = 42.64'
VOL (x5) = ~14.0 gal

1445 BEGIN BAILING AMW-02, ~14.0 gal

12/18/07 TUESDAY 6/

1502 FINISH BAILING AMW-02, BAILED DRY, ~7.0 gal BAILED, CLEAN-UP, MOVE TO AMW-07

1506 AMW-07
DTW = 42.68 TD = 44.78'
VOL (x5) = ~1.5 gal

1512 BEGIN BAILING AMW-07, ~1.5 gal

1525 FINISH BAILING AMW-07, ~1.5 gal BAILED. SAMPLE 12/19/07, CLEAN UP, MOVE TO AMW-5A

1527 AMW-05A
DTW = DRY TD = 30.96
VOL (x5)

1532 GO TO POLYTANK TO EMPTY BUCKETS, LOAD UP COOLERS TO DROP OFF AT TRAILER.

1600 OFF-SITE

12/19/07 WEDNESDAY p.1/6

purpose: GW Sampling
ARCADIS: M. MEEHLSEN
WEATHER: 20's, FOGGY, AIR POLLUTANT ALERT

0700 ON-SITE, SIGN-IN; BADGE SHOWS MY NAME, BUT NOW "INVALID" AT SECURITY IN FRONT BUILDING. WILL GO TO GARY LATER TO FIX.

PICK-up BUCKETS IN TRAILER.

0715 MW-6
DTW = 4.45 TD = ~~4.33~~ 5.03
VOL(ES) = 0.5 gal

0727 MW-5
DTW = DRY TD = 9.40
VOL(ES) —

0731 MW-4
DTW = 7.54 TD = 8.30
VOL(ES) = ~0.6 gal

12/19/07 WEDNESDAY 2/6

0745 BEGIN BAILING MW-6, ~ 0.5 gal

0755 WATER COULD NOT BE PULLED OUT OF WELL WITH CHECK VALVE. 0 gal BAILED

0757 BEGIN BAILING MW-4, ~0.6 gal

0810 FINISH BAILING MW-4, ~~BAILED~~ DRY, ~ 200 mL BAILED

0812 TRIKA CALLED: OK TO USE BAILER ON MW-6.

0818 BEGIN BAILING MW-6, NOT ENOUGH WATER TO FILL BAILER. NO WATER BAILED.

0826 BEGIN BAILING MW-4.

0830 FINISH BAILING MW-4, ~400 mL BAILED, MOVE TO AMW-4

0833 BEGIN BAILING AMW-04

0900 FINISH BAILING AMW-04, BAILED DRY, ~ 6.5 gal BAILED, MOVE TO AMW-08

0910 BEGIN BAILING AMW-08

0920 FINISH BAILING AMW-08, BAILED DRY, ~ 7.5 gal BAILED, MOVE TO AMW-09.

0923 BEGIN BAILING AMW-09

0935 FINISH BAILING AMW-09, BAILED DRY, ~1.5 gal BAILED, MOVE TO AMW-01

0944 BEGIN BAILING AMW-01

1000 FINISH BAILING AMW-01, BAILED DRY, ~ 5.5 gal BAILED, GO TO POLYTANKS TO EMPTY BUCKETS.

1015 BEGIN BAILING AMW-06

1024 FINISH BAILING AMW-06, BAILED DRY, ~ 1.0 gal BAILED, MOVE TO AMW-10

1024 BEGIN BAILING AMW-10

1041 FINISH BAILING AMW-10, BAILED DRY, ~ 7.0 gal BAILED, MOVE TO AMW-02

1043 BEGIN BAILING AMW-02

1056 FINISH BAILING AMW-02, BAILED DRY, ~ 4.5 gal BAILED, GO TO POLYTANK TO EMPTY BUCKETS; ALL MONITORING WELLS BAILED DRY 2x, EXCEPT AMW-07; AMW-07 BAILED 5 VOL. ON 12/18/07

1105 FINISH EMPTYING BUCKETS, LUNCH, OFF-SITE

1125 ON-SITE, GW SAMPLING PREP

12/19/07 WEDNESDAY

1310 START/BEGIN SAMPLING MW-4 FOR VOC's, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

1333 FINISH SAMPLING MW-4, VOC's & RCRA (FIELD FILTERED); WILL RETURN TO FINISH SAMPLING; WELL DRY. MOVE TO AMW-4

1336 BEGIN SAMPLING AMW-04 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)
DTW = 42.14

Temp	Cond	ORP	DO	pH	gal
9.13	0.975	-135.9	6.54	7.15	15.5

1416 FINISH SAMPLING AMW-04, SLIGHTLY TURBID SLIGHT ODOR, CLEAN-up. BACK TO MW-4

1418 RESUME BEGIN SAMPLING MW-4

12/19/07 WEDNESDAY

Temp	Cond	ORP	DO	pH	gal/mL
3.36	0.830	-149.7	12.44	7.50	600 mL

1436 FINISH SAMPLING MW-4, TURBID, SLIGHT ODOR, ONLY ABLE TO SAMPLE RCRA METALS (TOTAL), CLEAN-up; MOVE TO AMW-01, SAMPLING PREP

1500 BEGIN SAMPLING AMW-01 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)
DTW = 32.36'

Temp	Cond	ORP	DO	pH	gal
9.09	0.930	-139.6	4.66	7.11	11

1535 FINISH SAMPLING AMW-01, SLIGHTLY TURBID, BLACK PARTICLES. CLEAN-up.

1545 OFF-SITE

12/20/07 THURSDAY p.1/

PURPOSE: GW SAMPLING, SOIL SAMPLING IN BALLFIELDS

ARCADIS: M. MEEHLHOSEN

WEATHER: 20's - 30's, p. CLOUDY

0700 ON-SITE, CHECK-IN, LOAD UP TRUCK WITH SAMPLE CONTAINERS, GW SAMPLING PREP

0740 BEGIN SAMPLING AMW-07 FOR VOC's, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)
DTW = 42.75'

Temp	Cond	ORP	DO	pH	gal
10.77	~~58.8~~ 581	-51.9	6.38	6.00	1.5

0825 FINISH SAMPLING AMW-07, SLIGHTLY TURBID, CLEAN UP, MOVE TO BALLFIELDS

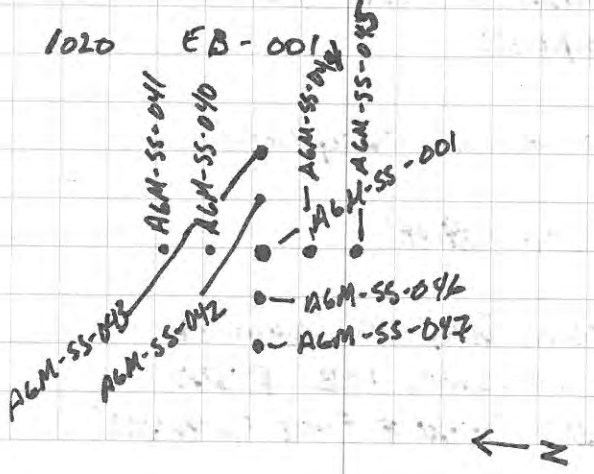
12/20/07 THURSDAY 2/

0833 ON-SITE AT BALLFIELDS, SET UP

0920 BEGIN SOIL SAMPLING AGM-SS-040 THRU AGM-SS-047

TIME	SAMPLE ID
0925	AGM-SS-040
0930	AGM-SS-041
0935	AGM-SS-042
0940	AGM-SS-043
0945	AGM-SS-044
0950	AGM-SS-045
0955	AGM-SS-046
1000	AGM-SS-047

1020 EB-001



1030 BEGIN PID READINGS

SAMPLE ID	PID (ppm)
AGM-SS-040	0.5
AGM-SS-041	0.4
AGM-SS-042	0.3
AGM-SS-043	0.4
AGM-SS-044	0.4
AGM-SS-045	0.5
AGM-SS-046	0.5
AGM-SS-047	0.4

1055 OFF-SITE AT BALLFIELDS, RETURN TO FORD FOR GW SAMPLING

1110 AMW-08, GW SAMPLING PREP

DTW = 39.38'

1125 BEGIN SAMPLING AMW-08 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

Temp	Cond	ORP	DO	pH	%Q
11.27	1022	-139.9	1.76	7.33	4.8

1155 FINISH SAMPLING AMW-08, TURBID, NO ODOR, CLEAR sys. MOVE TO AMW-09

1200 AMW-09, GW SAMPLING PREP

1210 GARY FROM TEST AMERICA WILL BE HERE AT 2:00pm; WRITING OUT CHAINS NOW

1300 FINISH CHAINS; GET ICE, LUNCH, OFF-SITE

1315 ON-SITE, AMW-09 GW SAMPLING PREP

1345 MEET TRIKA AT SECURITY, WAIT FOR GARY FROM TEST AMERICA

1410 GARY FROM TEST AMERICA HERE PICKED UP 5 COOLERS

1423 AMW-09
DTW = 85.54'

1430 BEGIN SAMPLING AMW-09 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

1500 FINISH SAMPLING AMW-09, ONLY VOC, RCRA METALS (TOTAL & DISSOLVED), SVOC, PARTIAL CONTAINER OF PCB, WELL DRY, NO READINGS, MOVE TO AMW-10

1506 AMW-10
DTW = 18.21'

TEMP	COND	ORP	DO	pH	gal
11.71	0.954	-163.5	1.74	7.54	15 gal

1540 FINISH SAMPLING AMW-10, TURBID, SLIGHT ODOR, CLEAN-up, MOVE TO AMW-02

1542 AMW-02
DTW = 29.14'

1550 BEGIN SAMPLING AMW-02 FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

TEMP	COND	ORP	pH	DO	gal
9.42	0.867	-83.5	7.57	6.60	11.5

1625 FINISH SAMPLING AMW-02, TURBID, SLIGHT ODOR, CLEAN-up, EMPTY BUCKETS

1640 OFF-SITE

12/21/07 FRIDAY p.1/1

PURPOSE: GW SAMPLING
ARCADIS: M. MEEHUSEN
WEATHER: 30's, FOGGY

0755 ON-SITE, SIGN-IN, TALK WITH JOHN MEYER

0803 AMW-06
DTW = 39.34

0815 BEGIN SAMPLING AMW-06
FOR VOC, SVOC, PCB, RCRA METALS (TOTAL & FIELD FILTERED)

0830 FINISH SAMPLING AMW-06, ONLY VOC's, RCRA METALS (TOTAL & FIELD FILTERED), 1 (ONE) JAR OF SVOC.
WELL DRY, NO READINGS, TURBID.

0833 PICKUP EQUIPMENT FROM TRAILER & DROP OF GARBAGE.

0900 OFF-SITE

1/9/08 WEDNESDAY 1/1

purpose: GW LEVEL MEASUREMENTS
ARCADIS: M. MEEHUSEN
WEATHER: 20's, p. Sunny

0920 ON-SITE, CHECK-IN

MW-6	1050	0 Dry	

7.17.07 p 1/2

ARCADIS: A. Fiskness, J. Dammel
Purpose: GW Sampling
Weather: 80°F, Sunny

09:30 Onsite assemble bottles for sampling.

1030 Set up at AMW-03A & B

1115 Collect water samples from AMW-03A and Dup-001 (20070717)

1145 Finished sampling at AMW-03A

11:55 Collect samples from AMW-04 for water

12:15 Finished sampling at AMW-04

1300 Collect Samples from AMW-01

1310 Finished collecting water samples from AMW-01

1325 Collect water Samples at AMW-02

1335 Finished sampling at AMW-02

1355 Begin sampling at AMW-07

1420 Finished collecting water Samples at AMW-07

7.17.07 p 2/2

1435 Meet Gary from Test America to exchange samples

1445 Go to Trailer to assemble bottles for remaining samples

1520 Head to office

Wed 7/18/07 p1/3

ARCADIS: A. Fiskness
Purpose: Gw sampling
Weather: 85°F, Mostly cloudy, humid

0930 AMF onsite, assemble equipment

0920 Collect water samples at AMW-08
0945 Finished sampling at AMW-08 clean up area
1005 Collect water samples at AMW-09
1110 AMW-09 bailed dry will finish collecting samples later today
11:25 Set up to sample at AMW-03B and collect MS & MSD
11:30 Begin purging AMW-03B w/ the grundfos pump
11:55 Finished purging AMW-03B and collect samples and MS & MSD
12:15 Pump slowed and stopped trouble shot pump only about 1/3 of bottles filled
1300 Unable to get going again in well will move to next wells and finish sampling later

Wed 7/18/07 p2/3

1310 Collect samples from MW-4
DTW = 7.90 TD = 8.14

1340 MW-4 purged dry while sampling Collected samples for VOC, and 1/2 container for RCRA Metals

1350 Collect samples from MW-5
1400 MW-5 purged dry will cont. to sample later

1405 Collect samples from MW-6
1415 Purged MW-6 dry
1420 Finish collecting samples from MW-5
1425 Purged dry MW-5 after Filling the metals container

1440 Clean up at MW-6, Collected sample for VOC, RCRA Metals and LL for SVOC
1500 Collect samples from AMW-06
1510 AMW-06 Bailed dry unable to collect samples for PCB's

7/18/07 P3/7

1600 Resume sampling AMW-03B with a bailer.
1700 Finished sampling. Beginning to rain w/ thunder and lightning clean up and head back office.
1715 Transfered water to tank, AMF offsite.

7/19/07 P4

ARCADIS: A. Fiskness, J. Dammel
Purpose: GW Sampling
Weather: 70°F

0800 Pack coolers
0910 Collect EQuipment Blank EB-001 (20070719)
0930 load up truck
1045 ARCADIS on-site @ AMW-6
1100 filled 1.25 bottles (1L) for PCBs, will return later to finish due to dry well
1115 begin to take water from AMW-9
1140 finished taking water from AMW-9, all bottles are filled will return to take YSI
1150 Begin to sample MW 6, 5, 4
1340 returned to AMW-06 got ~0.25L, will send out and PCB jar ~60% full
1400 YSI taken for AMW-09
1415 ARCADIS off-site

7/24/07
ARCADIS: J. Dammel
Purpose: GW Sampling
Weather: 80s, sunny

1040: ARCADIS on site, get drum, begin baling AMW-10 dry

ID	time	DTW	TD	wc	vol 500
AMW-~~8~~10	1045	20.09	42.36	22.27	3.56	17.82
AMW-05B	1120	32.53	55.16	22.63	3.62	18.10
AMW3B	1310	100.72	~~[illegible]~~ 150.94			

1115: AMW-~~8~~10 dry after ~5.5 gal.
1120: Begin to take depths; purge @ AMW-5B
1200 Purged ~15 gal from AMW05B, will return w/ sample bottles & will purge last 3 gal.
1300 Take water levels @ AMW-3B
1345 took H_2O samples @ AMW-05B

ID	time	DTW	TD
AMW-7	1410	42.91	44.92

1420: Purge AMW10 Dry 23 gal.
1515: mtr w/. ham from Test Americs
— ARCADIS off-site

Joseph W. Dammel

7/25/07
ARCADIS: J. Dammel
Purpose: GW Sampling
Weather: 80s-90s, Sunny
0930: ARCADIS on-site, will begin to purge AMW-10 dry
0945: approx 6 gal bailed from AMW-10, well dry will go off site & return to take samples
1115 Sample's YSI AMW-10

Monday 13 August 2007
ARCADIS: J. Dammel
Purpose: soil samples, water levels
Weather: 70s, sunny

1000: ARCADIS on-site, ballparks
1030: took soil sample Alum-SS-001 (ASB049)
1045: took soil sample Alum-SS-002 (ASB051)
1050: took soil sample Alum-SS-003 (ASB-053)

Monday 6-18-07 page 1/

ARCADIS: A.F.:Knees
Purpose: Utility Meet
Weather: 80°F, Lite Rain

09:45 AMF onsite at Ford plant at Cretin Ave meet w/ John From Ford and Quality Locators.
09:00 AMF at Cleveland and Ford Pkwy Meet location, Dave Hendrich there meet w/ other locators.
09:30 AMF Begin painting boring locations
10:30 Mellissa M [illegible] assisting to locate boring locations
10:45 Paint locations
12:45 Locations painted
13:00 Talk with Quality location who is locating Excel, Comcast + Qwest, Aaron. He is having another person assist him in locating.
13:45 Meet w/ Stew From City of St. Paul for utility clearing.

651-696-0557 Security

6/18/07 p2/

16:00 Talk w/ locators; locations are not all cleared yet. They will be back in the morning to finish.

Tuesday 6/19/07 p1/

ARCADIS: A. Fiskness, J. Dammel
Purpose: Finish utility locating begin drilling
Weather: 75°F, Sunny, windy

07:30 Finish packing equipment go to site.
07:50 Onsite meet w/ other ARCADIS (Trika Nelson-Holmes, Ryan Dorn, Bryan Zinda) and Drillers Boart + Bergerson-Caswell
08:00 AMF Checking clearing for boring locations + assisting locators.
09:00 Quality + City have cleared all West and S. of the main plant.

1000 Boart + Bergerson unload and set up decon pad in the Ballpen by the river (Disposal Area C)
11:00 Boart Gets water from Hydrant by Fuel D:1 House E of Main Building 1800gal

6/19/07 p2/

12:00 Begin Setting up at AMW-08
13:00 Set up ~~Move to~~ A go to lunch
14:00 Onsite Go over H+S

14:10 Begin AMW-08 core thru asphalt then will Hand auger to 5ft BGS

14:35 Collect soil Sample at AMW-08 from 3.5 to 5
Amw-08_3.5-5 (20070619)
For GRO, DRO, VOC, SVOC, PCB's, RCRA metals Dry wt

ID Amw-08_3.5-5

Param	Jar wt	Sample wt	MeOH	Time	Jar
VOC	63.2g	25.1g	Y	14:35	2oz Tared
GRO	82.8g	25.1g	Y	14:35	"
DRO	113.6g	51.4g	N	14:35	4oz Tared
SVOC					
RCRA metals	—	—	N	14:35	8oz Jar
PCBs					
Dry wt	—	—	N	14:35	8oz Plastic

6/19/07 P3/

19:00 Finished drilling at AMW-08
TD = 48.5. Shale is at 45' BGS
Will set well from 35' to 45'
BGS in the Limestone

Wednesday 6/20/07 P4/3

ARCADIS: A. Fiskness
Purpose: Bedrock Well installation
Weather: 75°F, P. Cloudy

7:30 Tailgate safety meeting with Boart, Bergerson & ARCADIS

8:00 Onsite at AMW-08, Boart setting up to complete the well. Water is at 42' BGS will set the well from 35' to 45' SS 10 slot screen w/ #40 Red flint sand.

4 bags of #40 sand
1 bag of fine sand

9:15 Mixing grout to grout up the well
10:00 Finished setting well, will complete the surface of the well at a later date. Cleaning up at well location.
10:30 Drillers to the staging area to decon the Drill rig
11:45 Drillers are finished decoaning will meet w/ John Meyers and setup

16:45 cont At AMW-09

17:30 Ford Workers finish moving trucks from the Area. Call TKNK to come up here and double check the utilities. Area is clear will set up drill rig.

BF

1300 Offsite for lunch

1400 Onsite begin coring through asphalt surface and then will hand auger through soil until refusal

Sample Area	Jar	Sample wt	Time	Pres	Jar
GRO	93.2g	25.5g	14:30	Y	2oz Tared
VOC	93.0g	25.1g	14:30	Y	"
DRO	113.4g	51.2g	14:30	N	4oz Tared
SVOC	—				
RCRA metals	—	—	14:30	N	8oz
PCBs	—				
Dry wt	Plastic Jar		14:30	N	

16:00 AMF meeting Joe & Gary from ARCADIS Test America to transfer samples

1630 Back at AMW-09, Trika at AMW-09

1700 Trika offsite

1820 Drilled to 45' BF in shale will stop for the day. Clean and secure area. Rain moving in to area.

18:30 Everyone offsite.

Thur 6/21/07 p1/

ARCADIS: A. Fiskness
Purpose: MW well installation
Weather: 75°F, Sunny

06:50 Onsite a Bullpen area C for tailgate Meeting
07:00 At AMW-09 Boart replacing alternator on drill rig.
07:40 Resume drilling at AMW-09

0945 John Meyers onsite, he would like all drilling water contained. He also brought over oil absorbant pads as there is a slight sheen from water running across the hydraulic piston for the walk way work area on the drill rig. Boart used the pads to soak up any petrol sheen
1000 John offsite.

11:20 Drill rig out of water at 90' BGS Will get more water from hydrant behind plant.
11:45 At site AMW-09 w/ 1880 gal of water. Resume drilling AMW-09.

Thurs 6/21/07 p2/

12:10 Finished Drilling at AMW-09 to 95' Stake is at 90'. Will Set a well from 80' to 90'
12:25 Everyone off site for lunch
13:15 Onsite for Lunch, Boart returned to location. Will set the well.
Sand — 1111 Bags #40
Fine Sand - 1 Bag. #7

Mixing high solids Cement Grout

1500 AMF off site, Boart Cleaning up around AMW-09
16:00 Boart Decomming tooling
16:45 Set up rig at AMW-02 in the Grass area by Hidden Falls Park.
1730 Finished setting up at AMW-02 AMF + TKN

Fri 6/22/07 p1/

ARCADIS: A. Fiskness, M. Meeuwsen
Purpose: MW installation
Weather: 75°F, Cloudy

06:45 AMF + MM onsite conduct H&S Meeting w/ Board
07:00 At AMW-02 set up for drilling
07:25 Begin Drilling at AMW-02
07:35 Collect soil sample from 5-6' BGS
AMW-02-5-6'(20070622)

Sample Param	Jar Wt	Sample Wt	Time	Pres	Jar Type
VOC	76.4g	25.9g	07:35	Y	2oz Tare

1000 Boart transfering 350 gal of drilling water into tank at staging area

6/26/07 P2/

wed 6/27/07 P1

ARCADIS: A. Fishness
Purpose: MW installation
Weather: 70°F sunny

06:55 AMF onsite, H+S tailgate meeting with Boart
0700 Boart at AMW-03B prep to resume drilling. Replacing hydraulic hose that leaked.
0740 Resume drilling at AMW-03B
1020 4" Core barrel locked in, difficulty retriving sample through 6" and 6" locked in 8" casing.
11:15 Boart will complete well pads at AMW-08 + AMW-09 and install bumper posts a AMW-02.
Boart 320-412-6007 Jim Cell

Note:
Boat Baited 6 gal water from AMW-09
and removed 6 gal water from AMW-02

Thurs 6/28/07

AREADIS: A. Fiskness, B. Zinda

Purpose: MW Installation

Weather: 59°F, Sunny

06:55 Conduct Tail gate H+S meeting

07:00 Boart will resume drilling at AMW-03B.

07:35 Boart drilling at AMW-03B

11:15 Boart having difficulty pulling sampler from boring. A new rig is on its way.

11:30 Boart getting another tank of water.

12:15 Tank full, Everyone offsite for lunch.

13:00 Everyone onsite. Boart cleaning up at AMW-03B.

13:30 New drill rig for Boart onsite. Setting up the drill rig. AMF to assist MM w/ soil Borings

14:15 AMF onsite Boart drilling at AMW-03B

16:00 ~~Finish~~ Able to get everything unstuck will drill with water and cut through SS.

Loads of Water/Mud

Time	Gallons	Type	Total at staging area
11:00	~~300~~	Mud	1800 gal
13:00	300	Mud	2100 gal
16:30	~~300~~	Mud	2400 gal
18:10	300 300	Mud	2700 gal

18:30 Drilled to 115' BGS w/out sampling. Will continue down to water or 150' BGS. Drilling in water should be easier.

19:00 Finished drilling for the day will clean up at AMW-03B.

19:20 Everyone offsite for the night.

ARCADIS: A. Fiskness
Purpose: MW installation
Weather: 65°F, Sunny

06:45 Onsite at staging area, conduct H & S tailgate meeting.
07:00 Everyone onsite to resume drilling.
07:10 Board getting another load of water - 1900g.
07:45 Board water tank full, return to AMW-03B to drill
0810 Resume drilling at AMW-03B
08:50 Drilled to 135' ~~water~~ drilling if easier and likely due to water in the formation. Changed at 130' BGS
10:35 Begin setting well, will set it at 140'-150'

Loads of water

Time	Gallons	Type	Total @ Staging Area
08:25	300	mud	3000
08:50	300	mud	3300
10:05	300	mud	
10:40	300	Mud	

12:15 Well set and sand pack poured in well. Board off site to get cement for Grout and lunch. AMF off site.

13:15 Board on site mixing grout. Will use cement grout to seal well.

15:15 Board finished mixing grout and grouting up AMW-03B. Clean up and secure area.

ARCADIS: A. Fiskness, M. Meeusen, B. Zinda
Purpose: MW Installation
Weather: 65°F, Cloudy

07:40 AMF onsite, Conduct Tailgate H&S meeting

0900 Onsite Board to get another tank full of water.

0940 Tank of water is full set up at AMW-03A to do boring/well will Drill to 40' and set well From 30' to 40' BGS See boring log for AMW-03B for stratigraphy.

09:10 Begin boring AMW-03A

11:45 Drilled to 40ft will set the well from 30' to 40' BGS.

1200 Board pouring sand pack down well bags used IIII, (fine sand bag

12:45 Grout up well w/ Neat cement

1300 Begin Cleaning up area around AMW-03A

1330 John Meyers onsite, He would like for Board us to clean up more of the fine sediment on the concrete.

13:45 Will pressure wash off the concrete and put sand bags around the storm water drain to filter out any fine material.

1400 John offsite, Boart continuing to clean up area.

1445 Finished cleaning up, drive down to staging area and decon rig/tooling.

16:10 Begin setting up at AMW-05 (well in grass by Fence to power plant)

16:45 Begin drilling at AMW-05

1705 Will sample AMW-05 from 20-22' BGS above SS. and in area that is moist.

Sample Parm	Time	Jar wt	Sample wt	Pres	Jar
VOC	17:05			MeOH	2oz tared
GRO	17:05	76.9g	25.7g	MeOH	2oz

6 gal removed before bailing dry

7/5/07 P4/3

ARCADIS: A. Fiskness
Purpose: MW Installation
Weather: 70°F, Sunny

06:45 AMF onsite, Boart on-site Conduct tailgate Safety Meeting and discuss utilities that were ~~encountered~~ encountered on Tuesday Night and Wednesday while installing pro-top and bumper posts

0700 Jim from Boart shows AMF the utilities encountered.

07:15 Call John Meyers and inform John of the utilities that were found.

07:30 Boart at plant to get a truck load of water.

07:45 ~~AMF~~ Waste Management onsite to ~~pick up~~ drop off rolloff box.

08:00 AMF & John Meyers took at locations where utilities were encountered; AMW-05 & AMW-06

08:10 John offsite, he is ok with moving AMW-03 to the concrete behind the fence

08:15 AMF + Boart checking location for AMW-01. Overhead line is low will only be able to access location thru gate. Utilities not fully painted will need private locator to relocate utilities.

0900 Call w/ Becky, move AMW-01 to SE bull-pen will need private locator to locate utilities

0930 Boart beginning to set concrete pads

12:45 water level at AMW-02
DTW = 30.48' TD = 42.6'

1630 Boart saw cut pad and removed concrete. Cleaning up area and putting waste into rolloff.

17:15 Boart to clean up around AMW-06 backfill bumper post holes.

17:25 AMF Measure water level at AMW-0
DTW = 42.43' TD = 44.78'

1800 Put equipment away in trailer

14/08 Boart off site.

Friday 7/6/07 p1/2

ARCADIS: A. Fiskness, T. Nelson
Purpose: MW Installation
Weather: 70°F, Sunny

06:45 Conduct Tailgate H+S Meeting
0730 Board to AMW-08, 09, 03A+B to mix and pour concrete pads
09:45 Meet Jim from Hance to locate 3 wells and determine what utilities were encountered.
10:45 Call with Bill Johnson from Excel; They are locating the tunnel.
11:45 Meet with Bill (excel) and Mike (From Quality) the tunnel is located We are cleared to drill in the parking lot
1200 Board finished w/ concrete pads.
12:15 Tim onsite show her well locations that were cleared.
12:45 AMF off site.
13:30 Board on Site from lunch.
13:40 Set up at AMW-01.
13:50 Begin drilling AMW-01
Calibrate PID w/100ppm Isobutylene → 100 ppm

Friday 7/6/07 p.2/2

Collect Soil sample from AMW-01 (8-10')

	Jar	Sample
VOC	80.6 g	29.5 g
GRO	82.7 g	29.5 g
DRO	123.5 g	55.5 g
SVOC	—	—
PCB	—	—
RCRA Metals	—	—
Dry wt	—	—

15:40 Finished drilling AMW-01 to 39' bgs. No good recovery from 19-39'. Jim hit SS @ 39' bgs.
15:50 Call A. Fiskness → don't keep 2' of core from 19-39' bgs.
16:00 Have Board drill 3 more feet.
→ No recovery → 1" of Sand
Will Set well monday
Screen 29'-39' bgs
14:20 Board begins to clear out hole and set 6" casing.
-clean up
17:10 Every one off site.

Monday 7/9/07 p1/4

ARCADIS: A. Fiskness
Purpose: MW Installation
Weather: 80°F, Sunny

0630 AMF onsite, check staging area. Drum and rolloff containers that were not covered have some water in them after the rain.
0700 Assemble equipment and get new ID badge from Gerry at H&S trailer
0720 Tailgate H&S meeting w/ Boart prior to Drilling.
0730 Boart onsite at AMW-01 to set the well. ~600 gal of water from drilling is containerized for disposal

0900 Total Depth to TOC is 41.6'
0940 Clean up around AMW-01, ~~begin~~ during equipment to staging Area for decon

1000 Total Water Stored in Staging Area

11:20 Begin Purging AMW-01 w/ a bailer
11:35 Bailed dry after 4.5 gal
11:40 Painted bumper posts at AMW-01 OSHA Yellow
11:50 Offsite to get more rope for bailing wells
12:40 Begin Purging AMW-02 w/ a bailer
12:50 Bailed 4 gal from AMW-02 move to next location, bailed dry
13:10 Bailer 0.25 gal from AMW-08 before going dry
1320 Begin bailing AMW-09
1335 AMW-09 bailed dry after removing 2 gal before going dry.

1340 Bailed MW-4 dry after removing 500mL of water
1345 Bailed MW-5 dry after removing ½ gal of water
1350 Bailed MW-6 dry after removing ½ gal of water
1410 Bailed AMW-04 dry after removing ~6 gal water

4:50 Begin Bailing AMW-03A
5:15 Bailed 10 gal from AMW-03A

1530 Begin bailing AMW-06
1535 Removed 2 gal from AMW-06 before going dry
1545 Transfer water into poly tank
16:15 Remove sediment stuck inside green 1500 gal tank. Only a thin layer of sediment remaining in tank.
16:30 Pump water from rolloff container to water tank removed ~ gallons of water.
1700 Remove water from ponded areas on tarps covering tanks.

1/23/08 WEDNESDAY p1/

purpose: DRUM OBSERVATION AT WATER TREATMENT PLANT
ARCADIS: M. MEEHUSEN
WEATHER: -2°F, p. Cloudy

0755 ON-SITE

- AFTER VIEWING DRUMS WITH BINOCULARS, NO EVIDENCE OF ANYTHING IN DRUMS; POSSIBLE GARBAGE CANS FROM PARKWAY ABOVE
- NO SAFE FOOT ACCESS TO DRUMS

0830 OFF-SITE

~~# OF LOADS: 2 ROLLOFFS~~ MSW

3/11/08 TUESDAY p.1/3

purpose: GROUNDWATER SAMPLING
ARCADIS: T. NELSON-KAMES, M. MEEHUSEN
WEATHER: P. Cloudy, 30's-40's
0730 Pack up equipment.
0830 Sign in at front desk-Security.
0855 Start round of WLs.

1335 BEGIN BAILING AMW-06

1341 FINISH BAILING AMW-06, ~1.0gal BAILED, BAILED DRY. MOVE TO AMW-01

1343 BEGIN BAILING AMW-01

3/12/08 WEDNESDAY 5/5

1354 FINISH BAILING AMW-01, ~3.0 gal BAILED, BAILED DRY, MOVE TO AMW-08

1359 BAIL AMW-08

1405 FINISH BAILING AMW-08, ~1.0 gal BAILED, BAILED DRY, MOVE TO AMW-09

1410 BEGIN BAILING AMW-09

1417 FINISH BAILING AMW-09, ~0.5 gal BAILED, BAILED DRY, EMPTY BUCKET, MOVE TO AMW-03A

1430 BEGIN BAILING AMW-03A

1441 FINISH BAILING AMW-03A, ~4.0 gal BAILED, BAILED DRY, EMPTY BUCKETS

1450 OFF-SITE

3/13/08 THURSDAY P. 1/4

PURPOSE: GROUNDWATER SAMPLING
ARCADIS: M. MEEHLWSEN
WEATHER: SUNNY, 30'S-40'S

0830 ON-SITE; CHECK IN WITH SECURITY

0835 NOTIFIED JOHN MEYER THAT I AM ON-SITE

0837 SET UP TO SAMPLE AMW-07 BAIL ~0.5 gal

0855 SAMPLE AMW-07 FOR, VOC, SVOC, CYANIDE, PCB, DISSOLVED RCRA METALS, GRO, DRO
SLIGHTLY CLOUDY, NO ODOR

Temp	SpC	Cond	%DO	DO	pH	ORP
12.16	0.611	461	65.3	7.01	6.63	147.5

0950 FINISH SAMPLING AMW-07, MOVE TO AMW-10

1015 BEGIN SAMPLING AMW-10 FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), DRO, GRO

Temp	SpC	Cond	%DO	DO	pH	ORP
11.95	1.010	759	19.0	2.09	7.15	-138.9

1055 FINISH SAMPLING AMW-10, SLIGHTLY CLOUDY, SLIGHT ODOR, TAN; MOVE TO AMW-02

1115 BEGIN SAMPLING AMW-02 FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), GRO, DRO

TEMP	SpC	COND	%DO	DO	pH	ORP
10.31	0.902	649	77.2	8.62	7.66	52.5

1150 FINISH SAMPLING AMW-02, SLIGHTLY CLOUDY, LT GRAY, NO ODOR, MOVE TO AMW-06

1215 BEGIN SAMPLING AMW-06 FOR VOC, SVOC, ~~PCB, RCRA METALS (FIELD FILTERED)~~ GRO, DRO

TEMP	SpC	COND	%DO	DO	pH	ORP
NO PARAMETERS TAKEN						

1230 FINISH SAMPLING AMW-06; WELL WENT DRY, ONLY VOC, SVOC SAMPLED; CLOUDY, LT GRAY, SLIGHT ODOR.

1235 PICK-UP ICE & LUNCH

1300 ON-SITE, SET-UP TO SAMPLE AMW-01

1325 BEGIN SAMPLING AMW-01 FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), DRO, GRO

TEMP	SpC	COND	%DO	DO	pH	ORP
12.22	1.174	887	21.5	2.30	7.18	-76.6

1355 FINISH SAMPLING AMW-01, CLEAR, NO ODOR, MOVE TO AMW-08

1359 FILLING OUT COC'S

1455 BEGIN SAMPLING AMW-08, FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), GRO, DRO

1530 FINISH SAMPLING AMW-08, NO PARAMETERS, WELL DRY; CLOUDY, LT GRAY, NO ODOR, MOVE TO AMW-09 (COOLER PACKED COC READY)

3/13/08 THURSDAY 4/4

1555 BEGIN SAMPLING AMW-09 FOR VOC, SVOC, RCRA METALS (FIELD FILTERED)

1620 FINISH SAMPLING AMW-09, CLEAR, NO ODOR; WELL DRY, NO PARAMETERS; WAIT FOR GARY FROM TEST AMERICA

1625 GARY FROM TEST AMERICA PICKED UP COOLERS; MOVE TO AMW-03A

1650 BEGIN SAMPLING AMW-03A FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), DRO, GRO * DUP 001 TAKEN

1746 FINISH SAMPLING AMW-03A, CLEAR, SLIGHT ODOR

Temp	SpC	Cond.	%DO	DO	pH	ORP
11.52	0.930	690	23.1	2.51	7.10	-84.6

1749 CHECK ON AMW-04; STILL COVED BY PLOWED SNOWPILE.

4/28/08 p1/1

ARCADIS: A. Fishkess
Purpose: Seep Sampling
Weather: 40°F, Cloudy Windy

07:30 Meet w/ Gerry from Arisker for Safety training

08:30 Meet w/ MPCA Karen, Amy & Besup

08:30 Onsite at Hydroplant w/ John Meyers of Ford, Karen Kromar, Amy ~~T~~ Besup (sp?) from MPCA. Walk area looking for GW seeps. None w/ measurable flow is detected. ~~Amy~~ MPCA determines there is no location to sample at and that we will wait until March 2009.

09:00 Everyone offsite.

4/10/08 p.1/2

ARCADIS: M. MEEHUSEN
PURPOSE: GW SAMPLING / W.L. MEASUREMENTS
WEATHER: CLOUDY; 60'S; BREEZE

1425 Sample AMW-03B.
1435 Finished sampling AMW-03B. ~40 gallons removed. Clean up. Dump H2O into poly tank
1500 Nitka took off.
1520 Ally drive down to MW4,5,6 area
1530 Set up and Begin Purging MW-6 & MW-5
1545 Purge ~ 1 gal from each & bail dry
1600 Move to MW-4 & begin Purging MW-4
1615 Bail ~ 0.5 gal from MW-4 & Bail dry
Back to MW-5 & 6
Both wells are still dry
1630 Move to AMW-4
Purge 5 gal from AMW-4 and bail dry.
1700 Sign out of site

Ally Auffermann

9/12/08 P. 1 of

ARCADIS : Ally Auffermann
Weather : Sunny 70s
Purpose : GW Sampling

1200 Pack up drive to Site
1245 Arrive @ site, pick up materials
1300 Set up & Begin Purging MW-3A
1348 Bail 17 gal from MW-3A (ready to be sampled)
1352 Arrive @ AMW-10 & dry 1st time
1415 Bail 7 gal from AMW-10
1430 Move to AMW-2
1433 Bail 6 gal & dry from AMW-2
1435 Dump water
1442 Arrive @ AMW-7
1443 Bail 1.5 gal from AMW-7 ready to be Sampled.
1457 Arrive @ AMW-6
1459 Gary of TA call to pick up samples.
1540 Back to AMW-6
1554 Bail 6 gal from AMW-6 & bailed dry.
1554 Move to AMW-1
1610 Bail 5 gal from AMW-1 & bail dry

9/12 Fri.

1624 Arrive @ AMW-8
1635 Bail 25 gal from AMW-8 & bail dry once.
1655 Arrive @ AMW-9
1712 Bail 3 gal from AMW-9 and bail dry
1721 Arrive at AMW-10 to bail 2nd time
1738 Bail 6 gal & dry @ AMW-10
1739 Arrive @ AMW-2 & bail 2nd time
1748 Bail dry the 2nd time at AMW-2 for 2 gal
1754 Arrive @ MW-6 & 5
1810 Bail 2nd time from MW-5 & 6 ~0.5 gal from each, both wells are bailed dry
1815 Arrive @ MW-4
1818 Bail dry 2nd time @ MW-4 <0.5 gal from MW-4
1822 Arrive @ AMW-4
1840 Bail 2nd time dry @ AMW-4 5 more gal
1845 Dump water
1903 Arrive @ AMW-6 to bail 2nd time
1913 Bail dry AMW-6 2nd time ~1 gal

9/12 Fri.

1915 Arrive @ AMW-1 to bail 2nd time
1925 Bail dry 2nd time @ AMW-1 ~4 gal
1931 Arrive @ AMW-8 bail 2nd time
1940 Bail 2nd time @ AMW-8 ~1 gal
1950 The gate to going into the parking lot where AMW-9 is located is locked!
2000 Check with security, they do not have the key for the gate.

off site

9/15/08 Monday p. 1/

Purpose: GW Sampling
ARCADIS: M. Meemsen
Weather: 60's

0850 On-site; check-in @ Security

0910 Begin Bailing AMW-9

915 Finish Bailing AMW-9; 0.5 gal bailed; Bailed Dry; Empty Bailed/purged H_2O into poly tank

935 Begin Sampling AMW-7 for VOC's, Cyanide, SVOC, DRO, GRO, ~~PCB~~, RCRA Mtls (Field Filtered)
PCB

1025 Finish Sampling AMW-07; clear, no odor;

1030 off-site

1207 on-site

215 Begin Sampling AMW-10 for VOC, SVOC, GRO, DRO, PCB, RCRA Metals (Field Filtered),

Temp	SpC	%DO	DO	pH	ORP
11.97	0.799	-1.8	-0.19	7.01	-65.1

243 Finish Sampling AMW-10; clear; slight odor

245 off-site

305 on-site; picking coolers for pick-up from Test America

345 Begin Sampling AMW-08 for VOC, SVOC, PCB, RCRA Metals (Field Filtered), GRO DRO

600 Gary from Test America pick-up AMW-07, AMW-10

607 Resume Sampling AMW-08

Temp	SpC	%DO	DO	pH	ORP
13.76	0.806	28.3	2.90	7.44	158.7

1631 FINISH SAMPLING AMW-08, CLEAR, NO ODOR; MOVE TO AMW-01

1655 BEGIN SAMPLING AMW-01 FOR VOC, SVOC, PCB, RCRA METALS (FIELD FILTERED), GRO, DRO

Temp	SpC	%DO	DO	pH	ORP
12.23	0.876	~~1.80~~ 16.5	~~7.58~~ 175	7.55	-1.8

P1/4

ARCADIS: K Hoehn, A. Roll; A. Pagnon

Purpose: Area C GW sampling

Weather: 60/70s, Sl. Cloudy

0708 KH onsite. Safety tailgate. Prep for GW sampling

- GW sample bottles
- filter supplies
- tubing
- preload sample bottles
- COC
- field forms

0900 Load up supplies/equipment. YSI/pump to arrive w/ FedEx shipment @ approximately 10-1030 Am.

Discussed w/AP:

- Stockpile II sampling (quantity/constituents)
- Stockpile volumes
- Sample SPII for TCLP VOCs, TCLP SVOCs, TCLP RCRA metals

1025 Equipment onsite. Load up and mobilize to FA10/11.

1038 Begin to mobilize equipment w/AP to AMW-19 and AMW-20.

1157 Pump on @ AMW-19.

* Pump out 3 well volumes instead of low flow due to inability to pump @ a low rate for low flow

Location: St. Paul area Date: 9/16/14

Project / Client: Ford TAP TUESDAY

Groundwater Sampling Form

Project Number:	MN000630.0002	Task:	00002	**Well ID:**	AMW-23
Date:	6/8/16	Sampled By:	Adam Thompson		
Sampling Time:	1042	Recorded By:	Adam Thompson		
Weather:	Sunny, 70's	Duplicate/QA/QC:	Dup-01 (20160608)		

Instrument Identification

Instrument:	PID	Water Quality Meter(s) YSI 650
Serial #:	—	—

Purging Information

Casing Material:	PVC	Purge Method:(circle one)	Submersible	Centrifugal	Bladder	Bailer	(Peristaltic)
Casing Diameter:	2 in	Screen Interval: From:	16	To:	26		
Total Depth:	28.97	Pump Intake Setting:	24				
Depth to Water:	20.02	Volumes to be Purged:	Low Flow				
Water Column:	8.95	Total Volume Purged:	2 gal	—			
Gallons/Foot:	0.17	Pump On:	1025	Off:	1105		
Gallons in Well:	1.4						

Field Parameter Measurements During Purging

Time	Minutes Elapsed	Rate (gpm or (ml))	Volume Purged	Depth to Water	pH (SI Units)	Conductivity (µmhos/cm)	Turbidity (NTUs)	Diss. Oxygen	Temp (°C or °F)	ORP (mV)	Comments:
1024	5	450	2250	19.97	7.33	1.065	72.0	6.32	11.90	5.8

Subject: RE: 7Q10 MissR Ford dam

Here is the result of my calculations and additional documentation. Please let me know if you have any questions.

7Q10 annual low flow estimate for Mississippi River at Ford Lock and Dam #1: 1253 cfs (cubic feet per second)

The period of record for the US Geological Survey continuous gage #05288500 near Anoka is 1931-present. For calculating the 7Q10 low flow the beginning year was changed to 1936 to reflect the consistent operation and presence of flow control structures such as dams. The 1936 start year was previously agreed to by Met Council, US Army Corps Of Engineers, US Geological Survey, and MPCA for conducting a wasteload allocation study of the Mississippi River for the Metropolitan Council wastewater treatment facility. The Mississippi River headwater reservoirs have been consistently operated since 1936.

The annual 7Q10 of the Mississippi River near Anoka at gage #05288500 is calculated at 1485 cfs
(based on a period of record of 1936-2013)

In addition, because the site at the Ford dam is downstream of the Minneapolis and St Paul water intakes, adjustments were made to reflect the withdrawal of water from the river for water supply. The withdrawal rates (during dry periods) are based on historical data and other information available from personal communications with staff at the Minneapolis Public Works Water Treatment and Distribution Services and Saint Paul Regional Waters Services.

Withdrawal amounts are estimated at approximately 232 cfs
124 cfs (80 mgd) for Minneapolis
108 cfs (70 mgd) for Saint Paul

Subject: RE: 7Q10 Miss. R. in Twin Cities Ford dam

Hi Phil,
I can help you find a 7Q10, but have some qualifiers for the number.

The period of record at the gage 05288500 near Anoka is 1931-present, and I have a number for the period of record of 1936-2002. The change to the beginning year was made to reflect the consistent operation and presence of flow control structures such as dams, and was previously agreed upon by Met Council, USArmyCorpsOfEngineers, USGeological

Survey, and MPCA for conducting a wasteload allocation study of the Mississippi River for the Metropolitan Council wastewater treatment facility. The Mississippi River headwater reservoirs have been consistently operated since 1936.

In addition, because the site at the Ford dam is downstream of the Minneapolis and St Paul water intakes, adjustments need to be made to reflect the withdrawal of water from the river for water supply. Withdrawal amounts back in 2004 were estimated at approximately 400 cfs; 116 cfs (75 mgd) for St Paul and 278 cfs (180 mgd) for Minneapolis. There is some uncertainty for the estimates, as they're based on MDNR water appropriation permit data and other information available from the water utilities.

How good does the calculation need to be, ballpark or more exact?

thanks,
Carol

Subject: 7Q10 Miss. R. in Twin Cities Ford dam

Hi Carol,

I have a request for 7Q10 data for the Mississippi River associate with the Ford lock and dam. The site listed was USGS Gauge #05288500. Can you help me with this? Thanks!

Phil

Subject: RE: SW guidance

Hi Phil,

This information will be used in calculating the resulting surface water concentration after discharge of a non-point source (groundwater plume) to the Mississippi River at the site mentioned in the emails below. A previous version of this report did a similar calculation and had the following in the text:

The 7Q10 value (37,011 L/sec) represents the lowest stream flow for seven consecutive days that would be expected to occur in a 10 year period and is therefore a conservative value representing a minimum amount of dilution. The data was obtained from United States Geological Survey (USGS) gage #05288500 on the Mississippi River near Anoka, MN and was provided by the MPCA.

I have looked for the email from the MPCA that might have more information on how it was calculated, but I can't find anything, so I apologize for that. As far as I am concerned, the precision is super critical. Even at a ten-year low period the flow of the river is much higher than our anticipated groundwater discharge so the exact number probably won't significantly change the result. I just want to make sure this is all above board and defensible. Amy, let me know if you disagree regarding the required precision.

Thanks

Ryan

Subject: Follow up to yesterday's conversation

Ryan,

Hi. I've copied our previous message strings and added in a follow up response for you to consider. I will try to touch base with Amy sometime today. Thanks. Phil

I just wanted to follow up on the following 4 pieces of information.

- 7Q10 data for the Mississippi River adjacent to the TCAP site
- Chronic criteria that may have been developed for barium, iron, manganese and vanadium since this was issued

There are no promulgated criteria values for these ions. I do use some guidance values though I would hesitate to call them chronic.

Understood, we can discuss them on the phone and I can either note that distinction in our tables/text or just say that "standards" aren't available. I may defer to Amy on that too

Follow up response: The following are guidance values that can be considered in regards to assessing risk associated with potential discharge to surface waters:

	Chronic	Acute
Barium:	700 ug/L	2700 ug/L
Iron	600 ug/L	1200 ug/L
Manganese	800 ug/L	1600 ug/L
Vanadium	132 ug/L	

For these metals the values would be applied as filtered (dissolved) fraction.

- Site-specific hardness value

II assume that this for receiving waterbody associated with the site?

Yes, this is for the Mississippi River

Follow up response:

For calculating the concentration of metal based on equations found in the Class 2B MN 7050 rules (https://www.revisor.mn.gov/rules/?id=7050.0222) use the hardness value reported from the sample used for analysis of the metal of interest. Otherwise, use the table of values found in the class 2B 7050 rules as guidance.

- Background metals concentrations for barium, cobalt, iron, manganese, mercury, thallium, and vanadium.

Not sure where this would be considered. Upstream of any discharge?
Yes, this would be background values for the Mississippi around the vicinity of the TCAP site so that we can make sure that constituents that may be added to the river don't exceed SW standards when including the background concentrations that are already in the river.

Follow up response:

For the remaining metals of interest – cobalt, Mercury and thallium:

Cobalt: 5 ug/L chronic and 436 ug/L acute. These are for total metal
Mercury: 6.9 nanograms/L chronic and 2400 ug/L acute. These are for total metal
Thallium: 0.56 ug/L chronic and 64 ug/L acute. These are for total metal.

The Surface Water Pathway Evaluation Users Guide that we are using for evaluation of this site says we need to get that information from the EAO. We are submitting this report for internal client review today using placeholder values, but hope to finalize and send to the MPCA for review next week.

TIER 1 SURFACE WATER SCREENING NUMBERS
FOR ALL NON-ORVW OR OIRW WATERS

CHEMICAL or POLLUTANT	CAS No.	UNITS	ENTER SITE CONCEN-TRATION	TIER 1 SCREENING NUMBER

Note #3 STANDARDS THAT VARY WITH TOTAL HARDNESS (TH): Metals include: cadmium, chromium^{+3}, copper, lead, nickel, silver, and zinc.

SEE ATTACHED WORKSHEET 1 AND MAPS IN APPENDIX 3 FOR PERFORMING CALCULATIONS. The maps contain conservative estimated hardness values for each major surface water drainage basin. Alternatively, water samples could be collected from the receiving surface water body and analyzed for total hardness.

Note #4 AMMONIA, UNIONIZED AS N - STANDARDS THAT VARY WITH pH AND TEMPERATURE
The ammonia leaching toward a surface water from a contaminated ground water site should be measured by collecting water samples from the temporary and permanent wells located just upgradient of discharge to the surface water body in question. The ammonia needs to be measured as TOTAL ammonia. The pH and temperature of the receiving body of water also need to be collected at the time the ammonia sample is taken. This information is used in the equation listed in the note below to determine the percent un-ionized ammonia, which, is then utilized to convert the total ammonia concentration in the wells to a non-ionized concentration.

The percent unionized ammonia can be calculated for any temperature and pH by using the following formula taken from Emerson, K., R.C. Russo, R.E. Lund, and R.V. Thurston. 1975. Aqueous ammonia equilibrium calculations; effect of pH and temperature. Journal of the Fisheries Board of Canada 32: 2379-2383.

$$f = [1 / (10^{(pka - pH)} + 1)] \times 100$$

where:
f = the percent of the total ammonia in the un-ionized state
pka = 0.09 + [2730/T], the dissociation constant for ammonia
T = temperature in degrees Kelvin (273.16 degrees Kelvin = 0 degrees Celsius).

SEE WORKSHEET 2 FOR PERFORMING CALCULATIONS.

TIER 1 WORKSHEET 1
WORKSHEET FOR CALCULATION OF THE CHRONIC AND MAXIMUM STANDARDS AND FINAL ACUTE VALUES FOR METALS
(place total hardness in Column B)

Metal	Total Hardness (1) (mg/L)	Chronic Standard (ug/L)
Cadmium	220	2.106602267
Chromium +3	220	394.8006526
Copper	220	16.02338277
Lead	220	8.680575832
Nickel	220	307.2030422
Silver	220	
Zinc	220	206.7521267

Notes:

(1) Obtain values for the total hardness in mg/L from surface water quality representatives in the Water Standards Unit, Environmental Assessment and Outcomes Division. The total hardness number (as $CaCO_3$) obtained from the MPCA EAO staff will be based on a statisitical evaluation of data generated from the Ambient Water Monitoring Program at the MPCA.
Alternatively, collect sufficient water samples of the surface water receiving body and analyze for Total Hardness. Site-specific hardness values can be used only if there is a sufficient amount of background data collected over time and it has good quality assurance. This data will be compared to STORET data to determine how adequate it is. If MPCA EAO staff determines the field data is inadequate, STORET data will be used until and if site-specific data are generated that meets criteria listed above.

	Turbidity	W15	NTUs		25	none	none									

NOTES:

(a) Because a water body has more than one use classification, all the water quality standards in each class apply to that body of water. If the water quality standards for the various classes are different, the more restrictive of the standards apply.

(b) Consult MPCA Environmental Assessment and Outcomes staff to obtain chronic criteria. The chronic criteria are not promulgated and their use is site-specific.

(c) Great Lakes Initiative criteria for the protection of wildlife from bioaccumulative chemicals (EPA 1995). Adopted in Minn. R. ch. 7052. Use meant for the Lake Superior watershed. Consult MPCA Environmental Assessment and Outcomes staff prior to use.

(d) National ambient water quality criteria. Use as an ecological screening number.

(e) Criteria values developed by Suter and Tsao (1996) using Tier II method described in EPA's Water Quality Guidance for the Great Lakes System. Use as an ecological screening number.

(f) Lowest Observed Effect Level values reported by EPA when insufficient data exists to calculate a National Ambient Water Quality Criterion. Effects were observed at this level and, therefore, the water concentration stated is not protective. Use as an ecological screening number.

Note # 1 CLASS 3D, 4C and 5 STANDARDS, applicable to wetlands.
In general, if Class 3, 4, or 5 standards are exceeded, background conditions shall be maintained. See Minn. R. 7050.0223, subp. 5; 7050.0224, subp. 4; and 7050.0225, subp. 2.

Note #2 DISSOLVED OXYGEN
Class 2B: The 5 mg/L daily minimum standard applies to all Class 2B waters except for the reach of the Mississippi River from the outlet of the metro wastewater treatment works in Saint Paul (River Mile 835) to Lock and Dam No. 2 at Hastings (River Mile 815). For this reach of the Mississippi River, the standard is
Class 2C: For this reach of the Mississippi River from the outlet of the metro wastewater treatment works in St. Paul (River Mile 835) to Lock and Dam No. 2 at Hastings (River Mile 815), the standard is not less than five milligrams per liter as a daily average from April 1 through November 30, and not less than four milligrams per liter at other times.
An additional exception to this standard is for the reach of the Minnesota River (a Class 2C water) from the outlet of the Blue Lake wastewater treatment works (River Mile 21) to the mouth at Fort Snelling. For this reach of the Minnesota River, the standard shall be not less than five milligrams per liter as a daily average year-round. The dissolved oxygen standard requires compliance with the standard 50 percent of the days at which the flow of the receiving water is equal to the lowest weekly flow with a once in ten year recurrence interval (7Q10). (From Minn. R. 7050.0222, subps. 4 and 5).
Class 2D: If background is less than 5.0 mg/L. as a daily minimum, maintain background.

Note #3 FECAL COLIFORM ORGANISMS
Not to exceed 200 organisms per 100 milliliters as a geometric mean of not less than five samples in any calendar month, nor shall more than ten perrcent of all samples taken during any calendar month individually exceed 2000 organisms per 100 milliliters.
The standard applies only between April 1 and October 31.

Note #4 pH
Class 2D standard: Maintain background.

Note #5 RADIOACTIVE MATERIALS
See Minn. R. 7050.0222, subps. 2 ,3, 4, 5 and 6; and 7050.0224, subps. 2, 3 and 4.

Note #6 TEMPERATURE
Class 2B standard: Five degrees F above natural in streams and three degrees F above natural in lakes, based on monthly average of maximum daily temperature, except in no case shall it exceed the daily average temperature of 86 degrees F.
Class 2C standard: Five degrees F above natural in streams and three degrees F above natural in lakes, based on a monthly average of the maximum daily temperature, except in no case shall it exceed the daily average temperature of 90 degrees F.
Class 2D standard: Maintain background.

TABLE 11

TIER 2 SURFACE WATER STANDARDS AND CRITERIA FOR CLASSES 2B OR 2C OR 2D, 3A OR 3B OR 3C OR 3D, 4A OR 4B OR 4C, AND 5 WATERS

					SURFACE WATER STANDARDS (a), (See Note #1) (MINNESOTA RULES PART 7050.0220)							OTHER SW CRITERIA		SCREENING NUMBERS		
				ENTER SITE CONCEN-	2B, C & D CHRONIC	2B, C &D MAXIMUM	2B, C & D FAV	3A/3B/3C/3D INDUSTRIAL	4A IRRIGA-	4B/4C LIVESTOCK/	5 AESTHE-	MN SITE SPECIFIC CHRONIC	GLI WILDLIFE	EPA CHRONIC	TIER II SECONDARY CHRONIC	EPA CHRONIC
	CHEMICAL or POLLUTANT	CAS No.	UNITS	TRATION	(CS)	(MS)		CONSUMPTION	TION	LIVE.+ IRR.	TICS	CRITERIA (b)	VALUE(c)	AWQC (d)	VALUE (e)	LOEL (f)
Note #7	Standards that vary with Total Hardness (TH)	SEE ATTACHED WORKSHEET 1 FOR PERFORMING CALCULATIONS.														
	For hardness values greater than 400 mg/L, 400 mg/L shall be used in the calculation of the standard.															
			Formula													
	Cadmium		CS = exp.(0.7852 [ln (TH mg/L)] - 3.49)													
			MS = exp.(1.128[ln(TH mg/L)] - 1.685)													
			FAV = exp.(1.128[ln(TH mg/L)] - 0.9919)													
	Chromium + 3		CS = exp.(0.819 [ln (TH mg/L)] + 1.561)													
			MS = exp.(0.819[ln(TH mg/L)] +3.688)													
			FAV = exp.(0.819[ln(TH mg/L)] + 4.380)													
	Copper		CS = exp.(0.62 [ln (TH mg/L)] - 0.57)													
			MS = exp.(0.9422[ln(TH mg/L)] - 1.464)													
			FAV = exp.(0.9422[ln(TH mg/L)] - 0.7703)													
	Lead		CS = exp.(1.273 [ln (TH mg/L)] - 4.705)													
			MS = exp.(1.273[ln(TH mg/L)] - 1.460)													
			FAV = exp.(1.273[ln(TH mg/L)] - 0.7643)													
	Nickel		CS = exp.(0.846 [ln (TH mg/L)] + 1.1645)													
			MS = exp.(0.846[ln(TH mg/L)] +3.3612)													
			FAV = exp.(0.846[ln(TH mg/L] + 4.0543)													
	Silver		MS = exp.(1.72[ln(TH mg/L)] - 7.2156)													
			FAV = exp.(1.72[ln(TH mg/L)] - 6.52)													
			The MS and FAV shall be no less than 1.0 ug/L.													
	Zinc		CS = exp.(0.8473 [ln (TH mg/L)] + 0.7615													
			MS = exp.(0.8473[ln(TH mg/L)] + 0.8604													
			FAV = exp.(0.8473[ln(TH mg/L)] + 1.5536)													
Note #8	STANDARDS THAT VARY WITH pH															
	For waters with pH values greater than 6.95, the CS shall not exceed the human health-based criterion of 5.5 ug/L.															
	For waters with pH values less than 6.96:	SEE ATTACHED WORKSHEET 2 FOR PERFORMING CALCULATIONS.														
	Pentachlorophenol		CS = exp.(1.005(pH) - 5.290)													
			not to exceed 5.5 ug/L													
			MS =exp.(1.005(pH)-4.830)													
			FAV = exp.(1005(pH)-4.1373)													
Note #9	The MPCA Environmental Assessment and Outcomes staff have developed site-specific criteria for these chemicals. Site-specific criteria are more thoroughly investigated,															
	but criteria have been promulgated to standards. Iron and manganese have special application.															
	Please consult MPCA Environmental Assessment and Outcomes staff and obtain their approval prior to use of the criteria or screening values.															
Note #10	For a pollutant with an asterisk next to the FAV and the maximum standard (MS), the following applies. For carcinogenic or highly bioaccumulative chemicals with BCFs greater than 5000 or log Kow values greater than 5.19,											Hg is 5.95 log Kow according to ATSDR				
	the human health chronic standard may be two or more orders smaller than the acute toxicity-based MS.															
	For the MS: if the ratio of the MS to the CS is greater than 100, the CS times 100 should be substituted for the applicable MS. For the FAV: if the ratio of the FAV to CS is greater than 200,															
	the CS times 200 should be substituted for the applicable FAV. From Minn R. 7050.0222, subp. 7., item E.															
Note #11	AMMONIA, UNIONIZED AS N - STANDARDS THAT VARY WITH pH AND TEMPERATURE															
	The ammonia migrating toward a surface water from a contaminated ground water site should be measured by collecting water samples															
	from the temporary and permanent wells that are located within the site plume just upgradient to discharge															
	to the surface water body in question. The ammonia needs to be analyzed as TOTAL ammonia. The pH and temperature of the receiving															
	body of water also need to be measured at the time the ammonia sample is taken. This information is used in the equation listed															
	below, to determine the percent un-ionized ammonia, which, is then utilized to convert the total ammonia concentration in the wells															
	to an un-ionized concentration.															

TABLE 11

TIER 2 SURFACE WATER STANDARDS AND CRITERIA FOR CLASSES 2B OR 2C OR 2D, 3A OR 3B OR 3C OR 3D, 4A OR 4B OR 4C, AND 5 WATERS

					SURFACE WATER STANDARDS (a), (See Note #1) (MINNESOTA RULES PART 7050.0220)							OTHER SW CRITERIA		SCREENING NUMBERS		
				ENTER SITE	2B, C & D	2B, C &D	2B, C & D	3A/3B/3C/3D	4A	4B/4C	5	MN SITE SPECIFIC	GLI		TIER II	
				CONCEN-	CHRONIC	MAXIMUM	FAV	INDUSTRIAL	IRRIGA-	LIVESTOCK/	AESTHE-	CHRONIC	WILDLIFE	EPA	SECONDARY	EPA
	CHEMICAL or POLLUTANT	CAS No.	UNITS	TRATION	(CS)	(MS)		CONSUMPTION	TION	LIVE.+ IRR.	TICS	CRITERIA (b)	VALUE(c)	AWQC (d)	VALUE (e)	LOEL (f)
	The percent unionized ammonia can be calculated for any temperature and pH by using the following formula taken from Emerson, K.,															
	R.C. Russo, R.E. Lund, and R.V. Thurston. 1975. Aqueous ammonia equilibrium calculations; effect of pH and temperature.															
	Journal of the Fisheries Board of Canada 32: 2379-2383.															
	$f = [1 / (10^{(pka - pH)} + 1] \times 100$															
	where:															
	f = the percent of the total ammonia in the un-ionized state															
	pka = 0.09 + [2730/T], the dissociation constant for ammonia															
	T = temperature in degrees Kelvin (273.16 degrees Kelvin = 0 degrees Celsius).															
	SEE ATTACHED WORKSHEET 3 FOR PERFORMING CALCULATIONS.															
Note #12	SETTLEABLE SOLIDS - Class 4C only															
	Shall not be allowed in concentrations sufficient to create the potential for significant impacts on															
	one or more designated uses. From Minn. R 7050.0224, subp. 4.															
Note #13	HYDROGEN SULFIDE in mg/L															
	0.02 mg/L for water bodies except wetlands; maintain background for wetlands. Hydrogen sulfide is measured as "S".															
Note #14	TOXIC SUBSTANCES															
	Class 4B Waters - No toxic substances at levels harmful either directly or indirectly.															
Note #15	CHLORINE, TOTAL RESIDUAL															
	Consult MPCA Environmental Assessment and Outcomes Staff if a discharge is proposed to be chlorinated. Most discharges are chlorinated to prevent or limit biofouling.															
	Each proposal needs to be reviewed site-specifically, based on a number of site-specific factors, such as the volume of chlorine to be added, the rate of application, the form of the chlorine,															
	the discharge 7Q10, and the nature and capacity of the receptor of the discharge.															

WORKSHEET 1
WORKSHEET FOR CALCULATION OF THE TIER 2 - CHRONIC AND MAXIMUM STANDARDS AND FINAL ACUTE VALUES FOR METALS
(place total hardness in Column B)

Metal	Total Hardness (1) (mg/L)	Chronic Standard (ug/L)	Maximum Standard (ug/L)	Final Acute Value (ug/L)
Cadmium	220	2.10660227	81.3704246	162.733171
Chromium +3	220	394.800653	3312.24326	6616.89139
Copper	220	16.0233828	37.2583423	74.5578903
Lead	220	8.68057583	222.75842	446.655617
Nickel	220	307.203042	2763.37739	5526.49404
Silver (2)	220		7.85727127	15.7531348
Zinc	220	206.752127	228.24523	456.514572

Per email from Alex in Area C Data Submittals folder

Notes:

(1) Obtain values for the total hardness in mg/L from surface water quality representatives in the Water Standards Unit, Environmental Assessment and Outcomes Division. The total hardness number (as $CaCO_3$) obtained from the MPCA EAO staff will be based on a statisitical evaluation of data generated from the Ambient Water Monitoring Program at the MPCA. Alternatively, collect sufficient water samples of the surface water receiving body and analyze for Total Hardness. Site-specific hardness values can be used only if there is a sufficient amount of background data collected over time and it has good quality assurance. This data will be compared to STORET data to determine how adequate it is. If MPCA EAO staff determines the field data is inadequate, STORET data will be used until and if site-specific data are generated that meets criteria listed above.

(2) Neither the MS nor the FAV shall be less than one ug/L.

TIER 2 DOWNSTREAM CONCENTRATIONS FOR COMPOUNDS EXCEEDING SURFACE WATER STANDARDS ON TABLE 11

Plume Discharge	Value	Units	Source
7Q10 value	1253	cfs	MPCA provided number
	3,065,900,544	L/day	
Plume Width	850	ft	Estimate based on site map
Plume Thickness	19	ft	Cross-section - Figure 3A
Groundwater Velocity	1.7	ft/day	CRA 1988
Groundwater Discharge	27,455	ft3/day	
	205,363	Gallons/day	
	776,274	L/day	

Downstream Concentration	Barium	Cobalt	Iron	Manganese	Mercury (total)	Thallium	Vanadium	Cyanide, free
Plume Concentration (ug/L)	240	9.9	9000	2800	0.27	9.7	0.64	15
Plume Discharge (L/day)	776,274	776,274	776,274	776,274	776,274	776,274	776,274	776,274
Background River Concentration (ug/L)	'--	--	'--	'--	'--	--	--	--
Low flow 7Q10 Value (L/day)	3,065,900,544	3,065,900,544	3,065,900,544	3,065,900,544	3,065,900,544	3,065,900,544	3,065,900,544	3,065,900,544
Potential Downstream Contribution from Area C	0.061	0.003	2.278	0.709	0.00007	0.002	0.0002	0.004
Resulting Downstream Concentration (ug/L)	0.061	0.003	2.278	0.709	0.00007	0.002	0.0002	0.004
Chronic Standard (ug/L)	700	5	600	800	0.0069	0.56	132	5.2

Background river concentration is calculated as the average of detected values in the dataset provided by the MPCA
No background data is available for cobalt, thallium, vanadium or cyanide
