EXECUTIVE SUMMARY

This *Area C – Comprehensive Site History and Investigation Report II* was developed by Arcadis U.S., Inc. (Arcadis) on behalf of Ford Motor Company (Ford) for Area C, a former waste disposal area at the former Twin Cities Assembly Plant (Area C). The objective of this comprehensive report is to document the Area C regulatory history, investigation activities and corresponding analytical results that have been completed to date under the guidance of the Minnesota Pollution Control Agency (MPCA) Voluntary Investigation and Cleanup (VIC) Program and Petroleum Brownfields Program (PBP). In addition, this report also evaluates the potential exposure pathways and provides an overview of groundwater quality data in two aquifer units beneath Area C (unconsolidated overburden and St. Peter Sandstone).

Based on a review of available historical documents, between 1945 and 1966 Area C was a former disposal area for industrial waste such as construction rubble, paint products and wastes, and non-combustible plant waste. In addition, excavated materials from former Main Plant parcel disposal Areas A and B were deposited in 1966 and 1962, respectively. Ford ceased disposal of industrial waste at Area C in 1966. The United States Army Corps of Engineers (USACE) conducted rehabilitation activities at Lock and Dam No. 1 near “Ford Bridge” between 1978 and 1983. Construction rubble and soil from the rehabilitation was disposed on top of the industrial waste by Al Johnson Construction Company General Contractors. According to Conestoga-Rovers & Associates (CRA) reports dated between 1988 and 1990, additional earth fill and construction rubble (i.e., broken concrete and road excavation rubble) from a Mississippi River Boulevard construction project were also disposed of at Area C around 1988 and 1990. However, exact quantities and composition of the materials disposed over time in Area C are unknown.

The Site was brought to the attention of the MPCA in October 1980 through receipt of a complaint concerning historical waste disposal practices. Subsequent to MPCA’s receipt of the complaint, a hydrogeologic investigation was commissioned by Ford in 1981. The investigation included the installation of five groundwater monitoring wells and groundwater sample collection as well as surface water sample collection from the Mississippi River.

The Site was identified to the United States Environmental Protection Agency (USEPA) in June 1981 in response to a reporting requirement of the newly enacted *Comprehensive Environmental Response, Compensation, and Liability Act*, commonly known as Superfund. However, the Site was never a federal Superfund site. In 1983, the passage of the *Minnesota Environmental Response and Liability Act* created Minnesota’s state Superfund program. Ford’s Twin Cities Assembly Plant was one of 87 sites in Minnesota that appeared on the original (1984) state Superfund list, also known as the Permanent List of Priorities (PLP), The Twin Cities Assembly Plant was listed on the PLP due to the presence of three on-site historical waste disposal areas (Areas A, B, and C).

In 1987, a supplemental soil, groundwater, and surface water investigation was completed at Area C and included the installation of test pits and waste characterization sampling along the southern boundary of the Site. Groundwater samples were collected from the five monitoring wells previously installed and surface water samples were collected from two locations along the Mississippi River. Groundwater and surface water sampling continued at selected locations through June 1990.

Based on the 1989 and 1990 groundwater and surface water sampling results, Ford submitted a request to the MPCA that no further investigation be required. The Twin Cities Assembly Plant, including Area C, was subsequently delisted from the Minnesota State PLP on July 8, 1993.

After the completion of the Arcadis 2007 Phase I Environmental Site Assessment (ESA) and investigation of abutting Sand Tunnel 1A, two additional monitoring wells were installed within Area C in 2011. In addition, Arcadis observed exposed construction concrete, scrap metal, and four 55-gallon metal drums along the western and southern slopes of the Site, as well as soil erosion and slumping during site reconnaissance in April 2011, January 2012, February 2012, and November 2012. The four drums were removed by excavation and disposed off-Site at a licensed facility in April 2012. The historical data review and investigation activities through 2012 were reported and submitted to the MPCA in the 2014 *Area C – Comprehensive Site History and Investigation Report.*

Following flooding of the Mississippi River in June and early July of 2014, and at the request of the MPCA, the five existing permanent monitoring wells surrounding Area C were gauged on a weekly basis and sampled monthly, if accessible, for a period of three months following the peak flooding period. In October 2014, the MPCA requested Ford to conduct additional investigation work in Area C to improve delineation and characterization of the industrial waste and to evaluate potential exposure pathways.

Between 2015 and 2016, Arcadis conducted these additional investigation activities, which included the completion of soil borings and vertical sampling through Area C, surficial soil sampling along the northern, western, and southern slopes of Area C, test trenching along the south slope of Area C, monitoring well installation within and along the perimeter of Area C, and groundwater sampling of both existing and newly installed wells.

Analytical data collected during the investigation activities were compared to the following screening values, as applicable:

- MPCA Soil Reference Values (SRVs) for direct contact with soil
- MPCA Petroleum Remediation Program (PRP) Guidance Values for direct contact with petroleum impacted soil
- Minnesota Department of Health (MDH) Health-Based Guidance values for ingestion of groundwater
- MPCA Surface Water Quality Standards (WQS) for exposure to surface water (aquatic life and human health via recreational use).

Additionally, human and ecological receptor screening was conducted against constituents which may potentially be present in the buried industrial waste and cause adverse health effects. This screening included the following:

- Potential Soil/Waste Exposure Pathway for direct contact with impacts
- Potential Groundwater Exposure Pathway for ingestion of impacted groundwater
- Potential Surface Water Exposure Pathway for discharge of groundwater to surface water
- Potential Surface Water Exposure Pathway for soil to surface water
- Potential Soil Vapor Exposure Pathway

Historical and current groundwater, surface water and soil analytical data was used to delineate the extent of and to characterize the industrial waste as well as evaluate potential exposure pathways. The

ten soil borings completed vertically through the top of the paved portion of Area C and the five test trenches completed near the toe of the southern slope are sufficient to delineate the approximate extent of the industrial waste fill in each accessible direction. The 40 soil samples collected from the soil borings and the 20 samples collected from the test trenches are sufficient to characterize the variability of impacts present within the industrial waste fill, the overlying construction debris and the underlying floodplain sands. Investigation of the distribution and characteristics of the industrial waste fill present at Area C is considered complete.

The evaluation of the potential exposure pathways to impacts associated with Area C can be summarized as follows:

- Direct contact with industrial waste: Debris at or near the surface has been identified within the zero to four foot below ground surface (bgs) accessible zone and paint sludge was identified in Trenches 1, 2 and 3 at depths as shallow as 2.5 feet bgs. The presence of paint sludge and impacted soil within the accessible zone at concentrations exceeding industrial SRVs represents a potential exposure pathway with an unacceptable level of long-term risk.
- Direct contact with surficial soil fill: Current land use does not allow exposure to surficial soil via direct contact, however, this exposure pathway could be complete in the case of trespassers. Results of surficial soil sampling completed on the slopes of Area C detected concentrations of Benzo(a)pyrene (BaP) equivalents and diesel range organics (DRO) that exceeded their respective screening values. The presence of surficial soil with contaminant concentrations exceeding industrial SRVs represents a potential exposure pathway with an unacceptable level of long-term risk. Additionally, there is construction debris including concrete and chunks of metal at the surface of Area C that present a potential physical hazard to trespassers in the area.
- Ingestion of groundwater: This exposure pathway is not considered complete because Site groundwater is not currently used as a drinking water source, and it is highly unlikely to be used as a source in the future. Also, as documented in the 2007 Phase I Environmental Site Assessment by Arcadis, no public water supply wells were observed within a one-mile radius of the Site.
- Discharge of groundwater to surface water: An evaluation of the discharge of groundwater to surface water was completed in accordance with the *MPCA Surface Water Pathway Evaluation User's Guide.* Results of that evaluation did not identify any unacceptable risk to surface water based on the groundwater data collected at Area C to date.
- Inhalation of Soil Vapor: There are no permanent buildings designed for occupancy within 100 feet of Area C, therefore vapor intrusion is not a completed exposure pathway.

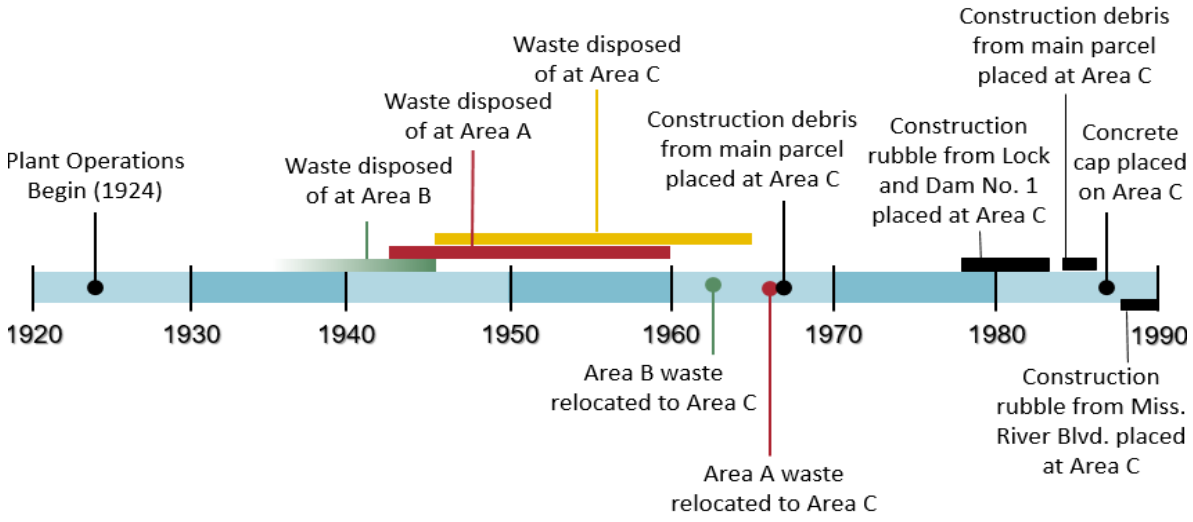
A Feasibility Study will be completed for Area C to evaluate remedial options for the potential exposure pathways identified above as having unacceptable long-term risk.

1 INTRODUCTION

This *Area C – Comprehensive Site History and Investigation Report II* was developed by Arcadis on behalf of Ford for Area C, a former waste disposal area at the Twin Cities Assembly Plant (Area C). This is a comprehensive report that summarizes all information pertaining to disposal of wastes at Area C of the Site; recaps the regulatory actions taken at the Site; and documents all investigation work related to soil, groundwater, and surface water that has been collected at Area C, including information collected during supplemental investigation activities conducted between 2014 and 2016. The purpose of the supplemental investigations was to provide groundwater elevation and quality data during flooding of the Mississippi River; to provide lateral and vertical delineation as well as characterization of the industrial waste at Area C; to evaluate potential exposure pathways, if any; and to provide an overview as well as current groundwater quality data in the two aquifer units at Area C (unconsolidated overburden and St. Peter Sandstone). This *Area C – Comprehensive Site History and Investigation Report II* has been completed in accordance with the MPCA VIC and PBP reporting guidelines.

2 AREA C DISPOSAL HISTORY

Area C is located on the river parcel of the Ford TCAP property (west of Mississippi River Boulevard), on top of fluvial deposits at the base of a bluff west of South Mississippi River Boulevard, and south of the steam plant (Figure 1). The sections below summarize the site history and historical disposal practices that occurred in Area C and on the main parcel located east of Mississippi River Boulevard as they relate to Area C. A timeline of disposal activities is shown below:



A more detailed summary of the disposal practices at each area are included in Sections 2.1 through 2.3 below.

2.1 Former Waste Disposal Areas A and B

Former Fill Areas A and B, illustrated on Figure 1.2 from the Conestoga-Rovers & Associates (CRA) *Remedial Investigation/Feasibility Study (RI/FS) Work Plan* dated February 15, 1991 (Appendix A), were historical waste disposal sites for industrial wastes generated on the main parcel (i.e., paint waste, paint sludge and other plant wastes).

Former Fill Area A was used as an industrial waste disposal site from 1943 until 1960 and was located at the south end of the former test track east of the main assembly plant on the main parcel. The exact dates and quantities of the disposal events are not known. Based on a file and aerial photo review, a railroad track expansion project required Area A and a portion of the former test track to be excavated. The excavated materials were deposited onto Area C in 1966.

Former Fill Area B was used for burning waste and burial of industrial waste during early plant operations until 1945, and was located approximately 800 feet south and east of the main assembly building on the main parcel. Buried waste included non-combustible materials such as scrap steel, bricks, concrete block and other solid materials. The exact dates and quantities of these burning and burial events are not known. Excavated materials from Area B were deposited onto Area C during construction of a parking lot expansion in 1962.

Between 2015 and 2016, Arcadis completed 12 test trenches through the overburden to delineate the lateral and vertical extent of impacted soil/residual waste associated with Former Fill Areas A and B both on the main parcel and to the south onto the adjacent Canadian Pacific property. Six of the 12 trenches were completed on-Site and six trenches were completed on the adjacent Canadian Pacific property. Analytical results and field observations from the trenching activities indicated the impacted soil is limited to the overburden material (brown silty/sandy clay) and does not extend vertically into the native blue-gray clay. The impacted soil is characterized by the presence of debris (e.g., brick, glass, concrete, cables, scrap metals [copper, aluminum, steel, iron], nails, and wiring), olfactory impacts (e.g., petroleum-like, solvent-like, or both), and elevated photoionization (PID) readings. In addition, based on analysis of soil samples collected during the trench investigation, impacted soil from within Former Fill Areas A and B contains concentrations of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and metals exceeding MPCA Tier I Residential and Tier II Industrial SRVs. Additional details pertaining to the investigation results were reported under separate cover in the *Comprehensive Phase II Site Investigation Report – Soil Addendum* (Arcadis 2016a).

The above industrial waste characterization information was used during delineation investigation activities in Area C.

2.2 Sand Tunnel 1A

During the initial Phase I ESA site walk in May 2007, Arcadis discovered storage drums buried under an accumulation of materials at the exit end of Sand Tunnel 1A (Feature 150). The base of Sand Tunnel 1A is located at an elevation of 711.0 feet above mean sea level (ft amsl). The ground surface above Sand Tunnel 1A is at an elevation of 772.9 feet amsl and the distance from the ground surface to the ceiling of the tunnel is approximately 56.7 feet. Due to health and safety conditions at the time of inspection, Arcadis could not determine the extent of the drum storage in Sand Tunnel 1A, but did observe black, rust, and turquoise staining on the floor and ceiling surrounding the open drums (Arcadis 2007a). The open drums were partially filled with solids and exhibited a paint-like odor.

The description of the materials placed in Area C is consistent with that found at the end of Sand Tunnel 1A. The material encountered at the terminus of the tunnel consisted of concrete, wood chunks and solidified paint sludge. A survey conducted in 2008 revealed that the end of Sand Tunnel 1A was directly below the northeast corner of Area C. Thus, it is believed that the conditions observed at the tunnel terminus is a result of disposal at Area C rather than a collapse of the tunnel (Arcadis 2009). A Remedial Action Plan for Sand Tunnel 1A was submitted to the MPCA on December 14, 2009 and approved on February 24, 2010. Because the presence of utility lines and standing water in the traffic tunnels limited vehicular access to Sand Tunnel 1A, removal of the waste in the tunnel was not possible. For this reason, the remedial action consisted of the installation of a barrier wall within the tunnel to isolate the impacted area from potential trespassers within the sand tunnel network. Arcadis completed remedial action on December 15, 2010. Additional details are provided in the *Response Action Implementation Report, 1A Tunnel Barrier Wall, Feature 150*, submitted to MPCA on January 11, 2011 (Arcadis 2011a).

2.3 Former Disposal Area C

From approximately 1945 to 1966, Area C was used as a disposal area for industrial waste, such as construction rubble, paint sludge, and old paints and solvents generated at the Site (CRA 1988, Ford 1982). An anonymous complaint dated October 1980 in MPCA's file states that during the 1950s "…waste solvents from the plant's painting baths were dumped over the steep bank overlooking the Mississippi River" and "solvents were dumped and waste in barrels was buried". Additionally, as noted above, excavated materials from Former Fill Areas A and B were deposited in Area C in 1966 and 1962, respectively. Drums containing industrial waste were also buried, as stated in a 1988 CRA report, although the number and contents are not known. However, the investigation noted above of Sand Tunnel 1A, which terminates within Area C, supported the presence of drums containing solids with a paint-like odor. In addition, historical records identify materials such as cardboard, wood, and scrap metal may have been placed in Area C. Batteries, used light ballasts, and capacitors were specifically excluded from the fill soil and were sent to an alternate off-site disposal facility (CRA 1988).

Disposal of industrial waste at the Site was discontinued in 1966, prior to enactment of applicable state and federal environmental regulations (i.e., MPCA in 1967, USEPA in 1970, Superfund in 1980).

After placement of the industrial waste described above, the following fill activities of non-industrial waste occurred over and around Area C:

- 1965 to 1966 - Ford placed an unknown volume of construction debris (concrete and soil) over the industrial waste materials at the Site.
- 1979-1981 - Al Johnson Construction Company General Contractors placed approximately 19,000 cubic yards (CY) of concrete, 10,000 CY of sandstone and approximately 18,000 CY of sand generated as part of the USACE Lock and Dam No. 1 rehabilitation project (near the "Ford Bridge"). The construction rubble was deposited between the Site and the Mississippi River (Appendix A). Overall, the USACE rehabilitation project lasted from 1978 through 1983.
- 1984 to 1986 - Ford placed an unknown volume of debris and excavated soil during construction of the Paint Building on the Main Assembly Plant parcel. The location of the Paint Building corresponds to the location of the former test track.
- 1985 to 1987 - The Site was covered with an 8-inch concrete cap to serve as a parking area for trailers. The paved area currently exists and is approximately 166,000 square feet (sq. ft), or 3.8 acres in size.
- 1988 to 1990 – Additional earth fill and construction rubble (i.e., broken concrete and road excavation rubble) from a Mississippi River Boulevard construction project were also disposed of at Area C around 1988 and 1990, according to CRA reports dated between 1988 and 1990.

3 AREA C GEOLOGY AND HYDROGEOLOGY

Historical figures and documents (CRA 1988, 1990b; Ford 1983) indicated the industrial waste fill is approximately 25 feet thick. However, delineation investigations conducted in 2015 and 2016, described in more detail below, determined the industrial waste fill to be approximately 35 to 40 feet thick at its maximum. Furthermore, test pits, boring logs (B-2, B-4, B-6, ASB-1001 through ASB-1010), and site reconnaissance confirmed that construction rubble, broken concrete, and soil were subsequently placed over and around the industrial waste fill, and range from approximately 40 to 60 feet thick.

The horizontal extent of the industrial waste fill in 2014 was extrapolated from figures included in CRA and Ford documentation to the MPCA (Appendix B). The extent of industrial waste fill as presented by CRA was based on the interpretation of Area C aerial photographs from 1945, 1956, 1958, and 1962 (CRA 1990). The Ford *Groundwater Monitoring Wells Survey* report (1982b) figure depicts a field drawing of a “filled area” and an “aged dump site” in reference to five monitoring wells present within the area at the time. Each report illustrates a different extent of industrial waste fill at Area C, as the aerial photography interpretation extends the length along the Area C access road to the south while the Ford field documentation extends further south, west, and north in comparison. Due to the discrepancy between the two reports, a delineation investigation was conducted in 2015 and 2016 (Arcadis 2015b). Based on those investigations as well as the historical extents, the approximate industrial waste terminus extent has been indicated on the Site layout map (Figure 2), translated onto cross-section figures, and incorporated within a three-dimensional model of the area. Additional details on the cross-sections and three-dimensional model are discussed in greater detail later in this report. The maximum terminus extent of industrial waste extends to approximately 340 feet west of the access road west of Mississippi River Road Boulevard (perpendicular of the access road).

3.1 Geology

Area C is located on a point bar east of the Mississippi River (Figure 2), between the river and South Mississippi River Boulevard. The general geology of Area C, based on information identified during historical and subsequent investigations, is described below. Data collected to date was used to develop representative geologic cross sections (Figures 3A, 3B, and 3C).

Area C contains construction rubble, broken concrete, fill soil, and industrial waste, as noted above. The fill soil consists predominately of clayey silt and clay (closer to the bluff) or sand and gravel (closer to the Mississippi River). This fill soil is approximately 40 to 60 feet thick and overlays the industrial waste. The industrial waste is up to 35 to 40 feet thick and includes pieces of metal, glass, brick, rubber, and plastic. The industrial waste was also indicated by petroleum-like and/or solvent-like olfactory impacts.

The materials described above are underlain by native sand and gravel (fluvial deposits) and then the St. Peter Sandstone. Bedrock was encountered at approximately 734 feet amsl (26 feet below grade) at soil boring B-6 (CRA 1998) and at approximately 695 feet amsl (37.5 feet below grade) at AMW-07. Both borings are near the bluff on the east side of the river parcel. The sandstone is composed of medium-grained, well-sorted and well-rounded quartzite. It is white to buff in color and is medium- to weakly-indurated (hardened). The elevation of the St. Peter Sandstone appears to decrease moving west towards the Mississippi River and was not encountered in borings installed to depths of 662 feet amsl (approximately 40 to 115 feet below grade). The Platteville Limestone overlies the St. Peter Sandstone

and is present in the river bluff located directly east of Area C but was not encountered in borings on the river parcel.

3.2 Hydrogeology

Groundwater elevation around Area C is approximately 686 to 691 feet amsl and groundwater flow is generally to the southwest towards the Mississippi River in the overburden and generally to the west towards the Mississippi River in the St. Peter Sandstone. Groundwater elevation and flow direction is influenced by the river stage and seasonal control of the river elevation at Lock Dam No. 1. This allows the potential for temporary reversal of flow direction during high water level events due to the direct connection between groundwater and the Mississippi River. A potentiometric surface map for the St. Peter Sandstone aquifer is included as Figure 4 and is based on monitoring wells in-place as of June 2016.

A hydraulic conductivity of $9x10^{-2}$ to $5x10^{-3}$ centimeters per second (cm/s) for the shallow aquifer in the vicinity of the Site was estimated by inputting the results of a grain size analysis of flood plain sediments performed by Soil Testing Services in January 1982, into Hazen's equation. Hazen's equation is an empirical formula for estimating hydraulic conductivity using the d_{10} value returned from a grain size analysis (CRA 1988). The d_{10} values from the grain size analyses ranged from 0.08 millimeters (mm) to 0.3 mm, and were used to calculate hydraulic conductivity:

$$K = A * (d_{10}{}^2)$$

Where:

K = hydraulic conductivity in cm/s,

A = empirical coefficient equal to 1.0, and

d_{10} = grain size (in millimeters [mm]) of the 10 percent retained (of a grain size analysis).

With a geometric mean hydraulic conductivity of $2x10^{-3}$ cm/s based on these grain size analyses, an average hydraulic gradient of 0.002 ft/ft, and a porosity of 30%, average groundwater velocity can be estimated at 0.1 to 1.7 feet per day (ft/day) using the following equation:

$$v = \frac{K * i}{n}$$

Where:

v = groundwater linear velocity in ft/day

K = hydraulic conductivity in cm/s

i = hydraulic gradient

n = porosity

Based on this average groundwater velocity, and the shortest distance through Area C (in direction of groundwater flow) of approximately 975 feet between the river and the edge of the bluff, the estimated groundwater travel time to the river would range from approximately 1.5 to 26 years between the east side of Area C (Sand Tunnel 1A) and the Mississippi River (river edge directly west).

The typical elevation of the Mississippi River is approximately 689 feet amsl, similar to the water table below Area C. Flood elevations for the Mississippi are 707 feet amsl (10-year), 714 feet amsl (50-year) and 717 feet amsl (100-year), or 18, 25, and 28 feet above the currently observed groundwater table elevation. Two major flooding events have been recorded for the Site and include:

- April 1965: The river elevation was 719.02 feet amsl (Appendix A), which was 30 feet above the currently observed groundwater table and two feet higher than the average 100-year flood elevation; the highest recorded elevation since plant operations commenced.
- June 2014: The river elevation was 703.90 feet amsl, or 15 feet above the current observed groundwater table and three feet below the average 10-year flood elevation.

3.3 Geologic Interpretation

The three cross-sections of the Site (Figures 3A, 3B and 3C) incorporate the interpretation of the vertical and horizontal extent of the industrial waste and construction debris fill. The cross sections also include the groundwater elevation based on the most recent gauging data in 2016 as well as floodwater elevations representative of 10-year, 50-year, and 100-year flood events. There is the potential for the river elevation to rise above the elevation of the bottom of the industrial waste during 10-, 50- and 100-year flood events. However, the potential for groundwater to come into contact with the lower portion of the industrial waste during these flood events is potentially mitigated by the relatively slower response of groundwater to match elevation fluctuations of surface water. Additionally, the portion of Area C where industrial waste has been reported (Section 2.3) is set back a minimum of 340feet from the nearest bank of the river and approximately 700 feet from the bank of the river in the direction of groundwater flow, which will further dampen any groundwater response to a flood stage fluctuation in river elevation.

In addition to the cross-sections, information collected from the site from as early as 1945 through investigations completed in 2016 were utilized to develop a three-dimensional representation of the surficial topography and underlying geological layers noted in Section 3.1. Flood water elevations representative of 10-year, 50-year, and 100-year flood events are also presented within the three-dimensional model. The layers within the model were created by developing a layer framework within Earth Volumetric Studio (EVS), a visualization software package developed by CTech Development Corporation. The convex hull gridding method and Kriging interpolation was utilized within EVS to develop the horizontal and vertical extent of each layer from defined discreet points. The discreet points across the area provide locations of known thickness of material layers for the gridding and interpolation process. These points were formulated from the following sources:

- Geological boring logs of historical and existing groundwater monitoring wells (B-1 through B-6, AMW-07, AMW-19 through AMW-26);
- Historical maps with the horizontal extent of the industrial waste fill developed from aerial images and field observations (Appendix B);
- Field observations noted during the digging of historical test pits (discussed further in Section 4.2);
- Field observations noted during the digging of supplemental test pits as well as borehole drilling in 2015 and 2016 (discussed further in Section 4.6);
- Aerial photography for the years 2010-2012; and

- Topography and site reconnaissance data (photographs and notes discussed further in Section 4.4.1.2).

A CD containing a working version of the three-dimensional model is presented in Appendix C.

4 INVESTIGATION AND REGULATORY HISTORY

The following is a brief summary of the soil and groundwater investigation activities that have taken place at Area C to date. All observations, soil analytical and groundwater analytical data from these investigations are included within the results discussion, tables, and figures of this *Area C – Comprehensive Site History and Investigation Report II*. The historical data provides background information and was used to help develop a scope of work for the more recent investigation. However, the evaluation presented in Section 9 of this report will focus primarily on the most recent comprehensive data set that was collected in accordance with current standard operating procedures.

4.1 Initial 1981 Investigation Summary

Area C was identified to the USEPA by Ford in 1981 during the Superfund notification process in response to a reporting requirement of the newly enacted *Comprehensive Environmental Response, Compensation, and Liability Act*, commonly known as Superfund. However, the Site was never a federal Superfund site. In 1981, in response to the MPCA's request for the installation of monitoring wells at the Site, Ford retained Soil Testing Services of Minnesota, Inc. (STS) to complete a hydrogeologic survey (Ford 1982). Following the survey and MPCA approval of the proposed monitoring well locations, STS completed soil borings and monitoring well installations in December 1981. Ford personnel subsequently completed two groundwater sampling events and collected surface water samples. Investigation activities and results were presented after each event in the March 3, 1982 *Groundwater Monitoring Well Survey* and February 11, 1983 report *Waste Disposal Site – Groundwater Investigation*.

Six soil borings (B-1 through B-6) were completed around and through the current limits of Area C (Figure 2). Borehole depths ranged from 19.5 to 51 feet below ground surface (ft bgs). Five of the borings (B-1 through B-5) were converted to 2-inch groundwater monitoring wells. The wells were sampled twice in 1982 (March and December) for VOCs and heavy metals (copper, cadmium, zinc, nickel, chromium, and lead). Additionally, surface water samples were collected in December 1982 from three locations and analyzed for VOCs and heavy metals (Ford 1983). The samples were collected along the east bank of the Mississippi River upstream and downstream of Area C and identified as:

- R1 - upstream of the Lock and Dam No. 1;
- R2 - near the TCAP southern property line; and
- R3 - approximately 200 yards south of the Ford TCAP property line.

Results of these investigations are discussed in Section 8 below.

In 1983, the passage of the *Minnesota Environmental Response and Liability Act* created Minnesota's state Superfund program. Later, Ford's Twin Cities Assembly Plant was moved to the original (1984) Minnesota state Superfund list, also known as the PLP, due to the presence of three on-site historical waste disposal areas (Areas A, B, and C). The Twin Cities Assembly Plant was one of 87 sites in Minnesota that appeared on the Minnesota PLP in 1984.

4.2 Supplemental 1987 Investigation

Subsequent to the deposit of construction debris between 1984 and 1986 as noted in Section 2.3 above, a supplemental investigation was completed by CRA from 1987 through 1990. The supplemental investigation included a file review and a hydrogeologic evaluation including additional groundwater and surface water sampling, installation of one additional groundwater monitoring well (B-6) the completion of test pits, a stadia survey, and waste characterization sampling. A final report of the investigation and results was submitted in the *Remedial Investigation/Alternatives Analysis Work Plan* dated February 11, 1991. In that report, Ford proposed additional field work for certain contaminated areas on the main parcel, but requested MPCA approval that no further investigation was necessary for Area C. This work plan was approved by the MPCA in a letter dated March 21, 1991. Subsequent to implementation of the work plan, the TCAP site, including Area C, was delisted from the Minnesota State PLP list on July 8, 1993.

Test Pit Investigation & Waste Characterization: A backhoe was used to complete 10 test pits along the southern boundary of Area C to a depth of nine feet bgs (Figure 2) in January 1988. Two of the test pits (TP-3 and TP-8) were observed to contain gray-black stained soil and a paint-like odor (CRA 1988). Samples of the stained soil were collected and sent to an off-site laboratory for waste characterization analysis. Specifically, test pit TP-3 soil was sampled for TCLP for VOCs and metals, flashpoint, reactive sulfide and pH. Test Pit TP-8 soil samples were analyzed by an extraction procedure (EP) toxicity leachate method for metals. The remaining eight test pits were not sampled as visual or olfactory indicators of contamination were not observed.

Stadia Survey: On February 16, 1988 monitoring locations B-1, B-2, and B-4 were surveyed due to the vertical extension of the wells in response to the expansion of the trailer storage area. Additionally, the northern and southern edges of the fill area were surveyed, although snowfall did not allow for the accurate location of the top of the fill area nor the test pits.

Results of these investigations are discussed in Section 8 below.

4.3 1989-1993 Monitoring Well Activities

In April 1989, due to the addition of construction debris associated with the Paint Building construction, monitoring wells B-1 through B-5 were inspected to confirm their integrity. All five monitoring wells were observed to be damaged, and repairs were completed at B-1, B-3 and B-5. Monitoring wells B-2 and B-4 could not be salvaged and were subsequently abandoned on May 31, 1989 (CRA 1990a). Copies of the well abandonment records are included in Appendix A. Following repair of the remaining three monitoring wells (B-1, B-3 and B-5), the top of casing and ground surface elevation at that time were resurveyed in September 1989.

Monitoring Well Installation and Sampling

1989 Sampling: Three groundwater sampling events were completed in June, August, and September 1989. Samples were collected from the repaired monitoring wells (B-1, B-3, and B-5) and submitted for laboratory analysis of halocarbon and aromatic VOCs and field-filtered metals (arsenic, barium, cadmium, copper, lead, mercury, nickel, selenium, silver, and zinc). Analysis of cis-1,2-dichloroethylene (cis-1,2-

DCE) and ethyl acetate was added for the August and September 1989 samples in accordance to the MPCA request (CRA 1990a).

Three surface water sampling events were completed concurrently with the groundwater sampling events in June, August, and September 1989. Samples were collected from the Mississippi River from two locations (upstream and downstream of Area C) and submitted for laboratory analysis of halocarbon and aromatic VOCs and field-filtered metals (arsenic, barium, cadmium, copper, lead, mercury, nickel, selenium, silver, and zinc). Analysis of cis-1,2-DCE and ethyl acetate was added for the August and September 1989 samples in accordance to the MPCA request (CRA 1990a).

1990 Monitoring Well Installation: On January 31, 1990, during a meeting with Ford to review the 1989 analytical results, the MPCA requested additional field work to be conducted at the Site. In response, an additional groundwater monitoring well (B-6) was installed to a depth of 47 feet below ground surface on the northwest side of Area C on April 9-10, 1990.

1990 Sampling: Two sampling events were completed in April and June 1990 (CRA 1990b) and included monitoring wells B-1, B-3, B-5, and B-6 and surface water samples from the Mississippi River (upstream and downstream of Area C). All four wells were sampled and sent for laboratory analysis of halocarbon and aromatic VOCs, the metals arsenic, selenium, and mercury via the Atomic Absorption Method, and barium, cadmium, chromium, copper, lead, nickel, silver, and zinc via USEPA Method 6010 (inductively coupled plasma analysis). Analysis of cis-1,2-DCE and ethyl acetate was also conducted per MPCA request in the letter dated April 25, 1989.

1993 Monitoring Well Abandonment: B-1, B-3, B-5 and B-6 were abandoned on November 19, 1993 (CRA 1994). Copies of the well abandonment records are included in Appendix A.

Results of these investigations are discussed in Section 8 below.

4.4 2010-2012 Investigation

In anticipation of plant closure, additional investigations were initiated by Arcadis in November 2010 after Area C was identified as a feature in the Arcadis 2007 Phase I Environmental Site Assessment (Arcadis 2007a). Between 2010 and 2012, activities completed at Area C included a Site reconnaissance to document recent conditions, drum removal, a topographic survey, surface water sampling, and groundwater monitoring well installation and sampling. Additional details on each of these activities are described below.

4.4.1 Site Reconnaissance

Ford and Arcadis conducted a Site reconnaissance of Area C in April 2011, and Arcadis conducted subsequent Site reconnaissance events in January, February, and November of 2012. Photographs of these Site reconnaissance events are included in Appendix D. During the Site reconnaissance events, Arcadis observed exposed scrap metal, concrete slabs with and without reinforcement steel bars, and erosion along the western slope base. The four- to eight-foot high erosion cut into the base of the western slope appeared to be the result of flooding events. The elevation of the top of the erosion cut is approximately equal to a 100-year flood (717 ft amsl). The southern slope of Area C did not appear to be as heavily eroded as the western slope, but did contain exposed concrete with and without reinforcement

steel bars; concrete-filled metal pipes; scrap metal beams, frames and support beams; asphalt, and used insulation. Arcadis also observed slumping along both the western and southern slopes, and what appeared to be a (now-exposed) geo-membrane barrier placed in an attempt to increase slope stability.

The surface parking lot on top of Area C was observed to be overall intact, with minor surficial cracking. There are precipitation run-off drains along both the southern edge of the concrete lot and northwestern quarter. These drains flow into the storm water retention pond to the north of Area C according to utility figures. The fence surrounding the storage parking lot is in good condition.

The fence line that separates the Site from Hidden Falls Regional Park is in disrepair. The fence has been cut open in two locations, and vegetation, tree growth, and soil erosion has damaged posts, the chain-link, and barbed-wire along the top of the fence. Soil eroding from the south slope of Area C has accumulated between Area C and the fence, resulting in the ground surface on the TCAP side of the fence being a few feet higher than on the park side of the fence. The missing portions of the fence are adjacent to walking paths in Hidden Falls Regional Park, and allow public access to the Site, as evident by a visible foot-pathway onto the Site from the park.

Site reconnaissance conducted in April 2011 and January 2012 also resulted in discovery of four exposed 55-gallon steel drums along the base of the western slope and on the southern slope. Details regarding the drum inspection and removal are provided below.

4.4.1.1 Removal of Drums

A visual inspection of Area C was performed by Ford and Arcadis in April 2011 to determine the pathway for equipment to use during the subsurface investigation, as described in more detail in Section 4.4.3 below. During the inspection, two drums were observed near land surface at the base of the southern and western slope in Area C during this initial visual inspection. One drum did not have a lid, was lying on its side, and appeared to have been partially filled with soil that washed in from the surrounding area. The second drum was empty and folded in half. Waste characterization samples of the soil in the drum were collected by MidAmerica Technical and Environmental Services, Inc. on November 11, 2011, under the supervision of Arcadis, and analyzed for VOCs, TCLP Resource Conservation and Recovery Act (RCRA) metals, mercury, polychlorinated biphenyls (PCBs) and SVOCs. Analytical results of the characterization samples indicated the contents of the drum were non-hazardous. The drums were removed from the Site by MidAmerica and disposed of at the Spruce Ridge Resource Management Facility located in Glencoe, Minnesota on February 3, 2012.

A subsequent visual investigation during the topographic survey conducted by Sunde Land Surveying, LLC, in January 2012 observed two additional drums near the top of the slope on the south side of Area C. One drum was in very poor condition and had been rusted through and broken into several pieces. The drum was empty with the exception of a small amount of soil that appeared to have washed into the drum. The second drum was approximately 75 percent full of a dried blue-gray material, which was believed to be solidified paint sludge. Characterization samples of the material remaining in the drums were collected by MidAmerica on February 3, 2012, under the supervision of Arcadis, and analyzed for VOCs, TCLP RCRA metals, mercury, PCBs and SVOCs. Analytical results of the characterization samples indicated the contents of the drum were non-hazardous. The drums were removed from the Site by MidAmerica and disposed of at the Spruce Ridge Resource Management Facility on April 11, 2012.

The locations, contents, analytical results, and dates of observance and removal of all four removed drums are illustrated on Figure 5. The analytical reports are included in Appendix E.

Results of these investigations were initially reported in the *Data Collected from Removal of Drums Located along Mississippi River* letter to the MPCA (Arcadis 2015a).

4.4.1.2 Topographic Survey and Observations

A topographic survey of Area C was completed in January 2012. The survey was centered on the paved portion of Area C and extended east to the asphalt access road, north to approximately the toe of the Area C slope, west to the Mississippi River and south to the property boundary of Hidden Falls Regional Park. The elevation contour lines generated from this survey are shown on Figure 2.

During the survey, scrap metal parts, metal cables, and concrete debris were observed at the ground surface in several locations, as illustrated on Figure 5. The scrap metal north and south of the concrete area contained scrap metal strips, sheets, springs/coils and cylinders, some partially buried and all heavily rusted. There was approximately 2 CYs of exposed scrap concrete on the floodplain, which appeared to be portions of barricades and pads. Additional scrap concrete was exposed along the erosion cut of the western slope. The scrap steel cable was approximately one-quarter inch to three-quarters inch thick.

Additional observations during the survey included a general overview of Area C. The industrial waste deposited in Area C between 1945 and 1966 appeared to be covered and surrounded by soil and construction debris and partially capped by an approximately 8-inch-thick concrete parking area with relatively few minor cracks. The construction debris fill deposited after 1966 that is not capped with concrete is vegetated with dense underbrush and trees on the slopes and floodplain. As indicated on Figure 2, the toe of the construction debris fill extends to approximately 50 feet to the river, and on average, is approximately 140 feet from the river. The footprint of Area C (including the construction debris) encompasses approximately 600,000 sq. ft, or approximately 14 acres. The footprint of the industrial waste disposal area, based on the delineation work completed during the recent investigation, is approximately 3.65 acres.

4.4.2 Surface Water Sampling

Surface water samples were collected from the Mississippi River in accordance with the *Groundwater Seep and Mississippi River Sampling Work Plan* (Arcadis 2008b) in order to evaluate surface water as a potential receptor. River water samples SW-01 (located upstream of the dam), SW-02 (located between the wastewater treatment plant and Area C), SW-03 (located downstream of Area C), and SW-04 (located downstream of the TCAP plant) were collected on November 4 and November 10, 2010. In addition to the river water samples, one sample was collected from the Hidden Falls outfall (Outfall-01) on November 4, 2010.

Samples were analyzed for VOCs, SVOCs, RCRA metals, gasoline range organics (GRO), diesel range organics (DRO) and hardness.

Results of this investigation was initially reported in *Technical Memorandum to Summarize the Seep and River Sampling Events* (Arcadis 2011b) and are discussed in Section 8 below.

4.4.3 Well Installation and Sampling

In accordance with the *Supplemental Phase II Exterior Work Plan* (Arcadis 2008a) approved by MPCA on March 15, 2010, Arcadis oversaw the installation of two additional monitoring wells (AMW-19 and AMW-20) in early November 2011 near the toe of the slope on the west side of Area C (Figure 2). After installation, these wells were sampled twice, on November 11, 2011 and January 17, 2012. Samples were analyzed for VOCs, SVOCs, dissolved Target Analyte List (TAL) metals, DRO, and GRO.

Results of these investigations were initially reported in the *Area C – Comprehensive Site History and Investigation Report* (Arcadis 2014a) and are discussed in Section 8 below.

4.5 2014 Groundwater Sampling

In June and early July of 2014, the Minneapolis/St. Paul area received several inches of rain over several weeks, which caused flooding of the Mississippi River near Area C. Following the flood event, the MPCA requested the permanent monitoring wells surrounding Area C (AMW-05, AMW-05B, AMW-07, AMW-19 and AMW-20) to be gauged weekly as well as sampled monthly for three consecutive months, if accessible. Monitoring wells AMW-19 and AMW-20 were initially inaccessible due to the flooding and thus were not gauged for two weeks nor sampled during the first month (July 2014). The remaining monitoring wells (AMW-05, AMW-05B, AMW-07) were gauged weekly and sampled monthly, with the exception of AMW-05 which was dry during the last month of sampling (September 2014). Accessible monitoring wells were sampled for VOCs and dissolved TAL metals. Monitoring well AMW-07 was also sampled for polynuclear aromatic hydrocarbons (PAHs) per MPCA request.

Results of these investigations were initially reported in the *Data Collected from Monitoring Wells Located along Mississippi River* letters to the MPCA (Arcadis 2014b, Arcadis 2014c, Arcadis 2014d) and are discussed in Section 8 below.

4.6 2015-2016 Investigations

Following MPCA review of the *Area C – Comprehensive Site History and Investigation Report* (Arcadis 2014a), the MPCA submitted an October 14, 2014 letter to Ford requesting additional investigation work at Area C to improve delineation and characterization of the industrial waste and to evaluate potential exposure pathways. An Area C Investigation Work Plan was developed and included vertical borings with soil and surficial soil sampling, test trenching, monitoring well installation and groundwater sampling (Arcadis 2015b).

Area C Work Plan Implementation: Arcadis installed 10 vertical soil borings as well as completed five test trenches to verify the lateral and vertical footprint of the industrial waste placed at Area C. The vertical soil borings were completed through the concrete which covers Area C within and along the perimeter of the estimated extent of industrial waste, based on historical sketches. The five test trenches were completed along the south slope of Area C near the estimated location of industrial waste, based on historical information. Soil samples from various intervals within the industrial waste (representing different areas of disposal) and from native soil below the industrial waste were collected for waste characterization consistent with the Work Plan. In addition, 31 surficial soil samples were collected along the north, west, and south slopes of Area C to evaluate the potential exposure to any current or future receptors. All soil

samples were collected consistent with the Area C Investigation Work Plan. MPCA staff was present for much of the drilling and trenching activities.

Arcadis installed eight new monitoring wells in the unconsolidated aquifer as part of the Area C Investigation Work Plan to improve the monitoring well network around Area C and to ensure that groundwater quality is adequately characterized (Arcadis 2015b). One well was installed through the concrete slab which covers Area C, approximately 70 feet beyond the terminus of the industrial waste. The other seven wells were installed around the northwest, west, and southern perimeters of Area C to provide monitoring well coverage in all accessible directions. Two of the monitoring wells are part of a nested pair and provide additional water quality characterization at the base of the unconsolidated aquifer (bedrock interface). The monitoring well installations were completed over two mobilizations in 2015 (September and December). All of the Area C monitoring wells (existing and newly installed in 2015) were sampled in March 2016 consistent with the Work Plan, including: VOCs, SVOCs, dissolved TAL metals and DRO. A second sampling event was completed in June 2016 as part of the Site-wide permanent monitoring well sampling event (described in more detail below) and included analysis of VOCs, SVOCs, dissolved TAL metals, DRO, GRO and cyanide.

Comprehensive Groundwater Sampling Event: In June 2016, 32 of the 35 permanent monitoring wells installed across the Ford site between June 2007 and January 2016 were sampled to provide a current and comprehensive picture of groundwater quality in accordance with the work plan (Arcadis 2016b). The wells proposed for sampling were selected based on previous analytical results, location and/or previous MPCA-approved work plans. The analytes that were collected from each well were determined based on the geologic interval in which the monitoring well was screened. One monitoring well within the St. Peter Sandstone was dry (AMW-05) and therefore could not be sampled. This report includes the discussion of a subset of the St. Peter Sandstone and the overburden Area C permanent monitoring wells only. A comprehensive discussion of the June 2016 groundwater sampling is included in the submitted *Comprehensive Phase II Site Investigation Report – Groundwater Addendum* (Arcadis 2016c).

The results of the 2015 and 2016 Area C investigations and a subset of the Site Wide groundwater investigation (relating to Area C) are discussed in Section 8 below.

5 GENERAL INVESTIGATION METHODOLOGY

This section provides a summary of the means and methods utilized during the 2007 to 2016 subsurface and surface water investigations completed by Arcadis. The means and methods utilized prior to 2007 by others are included in corresponding investigation reports included in Appendix A. Field logbook/documentation procedures and the field quality assurance program were implemented in accordance with the approved June 2007 Field Sampling Plan (Arcadis 2007b) and with MPCA-approved work plans. An addendum to Field Sampling Plan Section 3: Location and Sample Nomenclature was completed for the Area C investigations, and is included in Appendix F. Standard operating procedures used to complete this field work are included in Appendix G, when applicable. This section will also reference approved work plans when possible.

5.1 Utility Clearance

A full utility clearance was performed prior to initiating any subsurface work at the Site. Activities included but were not limited to:

- Notification of Gopher One Call to mark all public utility lines servicing the Site
- Utilizing a private utility locator in the areas identified for subsurface work
- Surficial inspection referencing available utility and historical operational maps for each proposed boring location, if available.

After removing any surficial debris (i.e., asphalt or concrete), a hand auger was used to 1) confirm the absence of utilities and 2) investigate the top 5 feet below ground surface if no utilities existed.

5.2 Soil Borings

Soil borings were advanced using multiple techniques: hand augers and direct-push, hollow-stem auger, and roto-sonic drill rigs were all used. Each boring was logged continuously by an Arcadis field geologist and screened using a PID with an 11.7 electron volt (eV) lamp. Soil boring logs were created in the field to identify material encountered for each borehole to total depth using the United Soil Classification System (USCS). Digitized soil boring logs are provided in Appendix H.

Two to five soil samples were collected at each borehole. As stipulated in the Area C Investigation Work Plan (Arcadis 2015b), soil samples were collected from the intervals containing indications of industrial waste, with the highest field indication of PID readings, and/or visual and/or olfactory evidence of impacts. If PID and/or visual and/or olfactory evidence of impacts were observed at multiple depth intervals that could provide useful assessment or delineation data, those intervals were sampled. If no PID/visual/olfactory evidence of impacts were observed, the 2-foot interval above the saturated zone or the lowermost interval of the soil boring (if the saturated zone was not encountered) was sampled. Borings were advanced until the target depth was reached or refusal due to bedrock was encountered. No soil samples were collected while installing groundwater monitoring wells AMW-19 and AMW-20 because there were no visual or PID indications of impacts during drilling. No soil samples were collected while installing groundwater monitoring wells AMW-21 through AMW-26 per the Area C Investigation Work Plan (Arcadis 2015b).

Soil samples were collected in laboratory-supplied containers and placed on ice pending shipment to the laboratory following standard chain-of-custody procedures. All samples were submitted to TestAmerica Laboratories in North Canton, Ohio for analysis of one or more of the following analytes:

- VOCs using USEPA Method 8260
- SVOCs using USEPA Method 8270
- GRO using the Wisconsin (WI) Modified Method
- DRO using the WI Modified Method
- TAL Metals using USEPA Method 6010
- PCBs using USEPA Method 8082
- TCLP VOCs using USEPA Method 8260 and 1311
- TCLP SVOCs using USEPA Method 8270 and 1311
- TCLP TAL Metals using USEPA Method 6010 and 1311

All TAL metals sample analyses included speciation for hexavalent and trivalent chromium. In addition to those analytical samples, each interval with indications of industrial waste were analyzed in the field using a petroleum sheen test (in accordance with MPCA Petroleum Remediation Program Guidance 4-04) and a solvent non-aqueous phase liquid (NAPL) test kit (e.g., Oil-in-Soil test kits) to identify petroleum or solvent based NAPLs. The field test results are included in Table 4 as well as the field book notes in Appendix I.

Additional details regarding the number of samples, bottles, preservation, etc. for each analytical method is included in Table 1. Upon completion, the borehole was sealed in accordance with MDH guidelines. The surface disturbance of each borehole was repaired to match surrounding materials.

5.3 Surficial Hand Auger Borings

A hand auger was used to collect a surficial soil sample from the upper one foot at each of the 31 surficial soil sample locations (Figure 2). At each of the sample locations, a picture of the area was taken and surficial debris (i.e., leaves, grass, organic matter, etc.) was removed prior to collecting the soil samples.

Soil samples were collected in laboratory supplied containers and placed on ice pending shipment to the laboratory following standard chain-of-custody procedures. All samples were submitted to TestAmerica Laboratories in North Canton, Ohio for analysis of one or more of the following analytes:

- VOCs using USEPA Method 8260
- SVOCs using USEPA Method 8270
- GRO using the WI Modified Method
- DRO using the WI Modified Method
- TAL Metals using USEPA Method 6010

Additional details regarding the number of samples, bottles, preservation, etc. for each analytical method is included in Table 1. Upon completion, the surface disturbance of each borehole was repaired to match surrounding materials.

5.4 Permanent Groundwater Monitoring Wells

5.4.1 Permanent Groundwater Monitoring Well Installation

Historical groundwater monitoring wells (prior to 2007) were installed according to procedures detailed in Appendix A. These six historical monitoring wells, which no longer exist, were installed within the Area C overburden and include B-1, B-2, B-3, B-4, B-5 and B-6.

Between 2007 and December 2015, 13 permanent groundwater monitoring wells were installed on the river parcel. Ten groundwater monitoring wells are screened within the unconsolidated overburden and three wells are completed in the St. Peter Sandstone aquifer. The groundwater monitoring wells were installed to evaluate groundwater quality within the river parcel footprint and Area C, as well as downgradient of Area C towards the Mississippi River (Figure 2).

Boreholes were drilled using either a nominal 4.25-inch inner diameter hollow-stem auger (overburden groundwater monitoring wells) or 6-inch roto-sonic drilling rig (bedrock groundwater monitoring wells). A dual casing methodology was used during roto-sonic drilling, where the inner casing is drilled past the outer casing, minimizing the potential for vertical migration of constituents. Soil samples and rock coring samples (if applicable) were collected continuously for wells installed in 2007 and 2015. Well construction and soil boring logs were prepared as described above, and each unconsolidated soil sample was screened in the field using a PID. Soil samples were not collected during the installation of overburden groundwater monitoring wells in 2011.

Groundwater monitoring wells were installed using various materials over the years in accordance with MDH requirements.

- Groundwater monitoring wells installed in the overburden at Area C in 2011 were constructed with 2-inch diameter, 10-foot long slotted Schedule 40 polyvinyl chloride (PVC) screen and black carbon steel riser.
- The groundwater monitoring well installed in the overburden within Area C in September 2015 (AMW-26) was constructed with 2-inch diameter, 10-foot long continuous stainless steel screen and black carbon steel riser.
- Groundwater monitoring wells installed in the overburden within Area C in December 2015 were constructed with 2-inch diameter, 10-foot long screens, either consisting of Schedule 40 PVC slotted screen and riser or continuous stainless steel screens and riser.
- St. Peter Sandstone groundwater monitoring wells (bedrock monitoring wells) were constructed with 2-inch diameter, 10-foot-long continuous stainless steel screens and black carbon steel riser.
- Surface completions were either flush-mount or stickup, depending on the location.

Each well had a filter sand pack extended to approximately 2 feet above the top of the screened interval. A 2-foot bentonite seal was placed over the sand pack and the remaining well annulus was sealed with cement grout to the surface. The wells were developed (bailing and surging techniques or air lifting) and permitted in accordance with MDH requirements. The well location, ground surface, and top-of-casing elevation for each well were surveyed to the Ramsey County coordinates and 1929 United States Geological Survey Vertical Datum.

A summary of the existing permanent groundwater monitoring well construction details is included in Table 2. Well construction logs are included in Appendix J. Copies of MDH well and boring records are included in Appendix K.

5.4.2 Permanent Groundwater Monitoring Well Sampling

Historical groundwater monitoring wells were sampled according to procedures detailed Appendix A.

Between 2007 and 2016, groundwater sampling procedures were as follows:

Each groundwater monitoring well was gauged prior to sampling. During each gauging event, static water levels were collected as well as depth to bottom measurements to determine casing integrity and siltation of the well screens. A summary of the permanent monitoring wells included in the discussion of this report and the corresponding groundwater elevations based on all gauging events (regardless if prior to a sampling event) is included in Table 3. In addition, a potentiometric surface map for the St. Peter aquifer based on monitoring wells in-place as of June 2016 is included as Figure 4.

Groundwater monitoring wells were sampled using the low-flow sampling method in accordance with the USEPA Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures (USEPA 1996a). Groundwater was purged using a peristaltic pump or a grundfos pump and dedicated tubing. If water levels exceeded approximately 25 feet below ground surface, monitoring wells were sampled using a dedicated bailer. Monitoring wells sampled with a dedicated bailer utilized the standard purge (three-well volume) technique rather than the low-flow method.

Water quality parameters (pH, temperature, specific conductivity, oxidation reduction potential, and dissolved oxygen) were collected during purging using a multi-parameter flow-through-cell and a separate turbidity meter. Once indicator parameters stabilized during low-flow groundwater sampling, or three well volumes were removed, samples were collected in laboratory-supplied containers and placed on ice pending shipment to the laboratory following standard chain-of-custody procedures. All samples were submitted to TestAmerica Laboratories in North Canton, Ohio of one or more of the following analytes:

- VOCs using USEPA Method 8260
- SVOCs using USEPA Method 8270
- PAHs using USEPA Method 8270
- DRO using the WI Modified Method
- GRO using the WI Modified Method
- Cyanide using USEPA Method 335.4
- Total and dissolved TAL Metals using USEPA Method 6010
- Total and dissolved RCRA Metals using USEPA Method 6010/ Method 7470

All groundwater samples analyzed for dissolved metals were field filtered using a 0.45-micron disposable filter prior to sample collection. Groundwater sampling logs are included in Appendix L.

5.5 Trenching

5.5.1 Field Screening

Soil excavated as part of the Area C investigation was screened in accordance with the Area C Investigation Work Plan (Arcadis 2015b). These excavations targeted delineation of industrial waste (e.g., glass, brick, metal, drums, paint sludge, elevated PID readings, visual staining) identified during historical test pit excavations. Individual trenches were extended down to the extent of the excavator limits (approximately 13 to 15 feet below ground surface), if possible. Two trenches (Trench 1 and Trench 3) hit refusal due to an asphalt cap and solidified paint sludge, respectively. Trenches were also extended laterally until no waste materials were observed in the trench for a minimum of 10 lateral feet. All excavated soil was screened using a PID with an 11.7eV lamp at a minimum frequency of once per 10 CYs of soil. The excavated soil was also continuously screened for the visual presence or olfactory indications of waste material. Excavated soil was handled as follows:

- If PID readings were less than 10 parts per million (ppm) and soil did not show any visual or olfactory indications of impacts or waste material:
    - The soil was stockpiled for use to be placed back in the excavation after trenching was complete, with no additional sampling requirements.
- If PID readings greater than 10 ppm and/or soil had any indications of visual or olfactory impacts or contained waste material:
    - Excavated soil was containerized for off-Site disposal in accordance with requirements of a Ford-approved and MPCA-permitted off-Site disposal facility. Excavated soil staged in roll-off containers were placed on and covered by polyethylene sheets within the roll-off container until removed from the Site.

5.5.2 Analytical Sampling

During excavation of each trench, soil analytical samples were collected at each test trench with evidence of industrial waste, with additional samples collected if the fill was of variable composition. For test trenches that did not exhibit evidence of industrial waste, a sample was collected from non-impacted soil. Samples were submitted for analysis of the following, per the Area C Investigation Work Plan:

- VOCs using USEPA Method 8260
- SVOCs using USEPA Method 8270
- GRO using the WI Modified Method
- DRO using the WI Modified Method
- TAL Metals using USEPA Method 6010
- TCLP VOCs using USEPA Method 8260 and 1311
- TCLP SVOCs using USEPA Method 8270 and 1311
- TCLP TAL Metals using USEPA Method 6010 and 1311

All TAL metals sample analyses included speciation for hexavalent and trivalent chromium. In addition to those analytical samples, intervals with indications of industrial waste were analyzed in the field using a petroleum sheen test (in accordance with MPCA Petroleum Remediation Program Guidance 4-04) and a

solvent NAPL test kit (e.g., Oil-in-Soil test kits) to identify petroleum or solvent based NAPLs. The field test results are included in Table 4 as well as the field book notes in Appendix I.

All soil samples collected for analysis were transferred to laboratory-supplied containers and placed on ice pending shipment to the laboratory following standard chain-of-custody procedures. Samples were submitted to TestAmerica Laboratories in North Canton, Ohio for analysis. Additional details regarding the number of samples, bottles, preservation, and holding time for each analytical method listed above is included in Table 1.

After each trench with identified waste was complete, Class 5 crushed concrete was used to backfill the excavations to grade. For trenches with no visual or olfactory indications of impacts or observed waste materials throughout the extent of the trench, the excavated soil was used to backfill the same trench to grade.

5.6 Surface Water Sampling

Surface water samples were collected directly from the Mississippi River. The sample depth within the river was approximately half the water column depth of the river at the time of sampling. Samples were collected from the river when its velocity was slow enough that Arcadis personnel could safely wade into the river to a depth of approximately four feet.

Immediately prior to sample collection, field parameters, including hardness, specific conductivity, temperature, pH, dissolved oxygen, and turbidity, were measured at each location using a field test kit for hardness and a multiparameter water-quality monitor for the remaining parameters.

Surface water samples were collected in laboratory supplied containers and placed on ice pending shipment to the laboratory following standard chain-of-custody procedures. All samples were submitted to TestAmerica Laboratories in North Canton, Ohio for analysis of the following:

- VOCs using USEPA Method 8260
- SVOCs using USEPA Method 8270
- RCRA metals (total) using USEPA Method 6010
- GRO using the WI Modified Method
- DRO using the WI Modified Method

Additional details regarding the number of samples, bottles, preservation, etc. for each analytical method is included in Table 1.

5.7 Decontamination Procedures

Drilling and sampling equipment (e.g., drill rig, drill casings, rods, sample barrel, hand augers, stainless steel spatulas) and equipment that could have potentially come into contact (directly or indirectly) with impacts were decontaminated on-site. Decontamination protocols were followed per the Field Sampling Plan between boreholes and before leaving the site at the end of the project.

Drilling and sampling equipment were disassembled and washed with a 2-percent solution of laboratory-grade detergent (e.g., Alconox) and city water. The equipment was scrubbed to remove any adhering particles and rinsed with distilled water. The clean equipment was then handled with clean disposable

gloves to avoid potential contamination. The 2 percent solution of laboratory-grade detergent and city water was changed daily, or more frequently after drilling at highly impacted locations.

Hand augers and stainless steel spatulas were rinsed with a solution of laboratory-grade detergent (e.g., Liquinox) and distilled water. The equipment was then scrubbed to remove any adhering particles and rinsed with distilled water. The clean equipment was then handled with clean disposable gloves to avoid potential contamination.

All decontamination water was containerized as investigation-derived waste (IDW) and disposed of as described in Section 5.8.2.

5.8 Investigation-derived Waste

IDW generated during the course of the subsurface investigations included soil cuttings, purge water, decontamination water, personal protective equipment (PPE) and disposable sampling equipment (i.e., filters, tubing, PVC). Waste Manifests for off-Site disposal are included in Appendix M.

5.8.1 Soil Boring IDW

Soil cuttings generated during the subsurface investigations were staged in 55-gallon drums, separated by location. Soil cuttings staged in 55-gallon drums were segregated in the field prior to disposal pursuant to not only the individual boring location but then also field screening results using the following segregation parameters:

- Zero to <100 ppm
- Greater than 100 ppm

In April 2014, waste characterization samples were collected from the 2013 to 2014-generated soil cuttings to develop a site-specific waste characterization profile for subsequent subsurface investigation soil cuttings IDW. The waste characterization samples consisted of composite samples collected from 12 of the 30 soil IDW 55-gallon drums. The site-specific waste characterization profile was used for off-site disposal of all non-hazardous soil cuttings generated between September and December 2015 during the monitoring well installations through and around Area C. The off-site disposal was facilitated through MPS Group and transported to the Spruce Ridge Facility in Glencoe, Minnesota.

For the soil cuttings generated during the June 2015 waste delineation soil borings, MPS Group developed all soil waste profiles, based on the characterization analytical results, and coordinated transportation and disposal of all non-hazardous and hazardous soil cuttings with the corresponding disposal facilities.

5.8.2 Purge Water and Decontamination Water IDW

Purge water and decontamination water generated during investigation activities when the assembly plant was operational were temporarily staged on-site within poly tanks or 55-gallon drums. The purge water and decontamination water was then characterized by Waste Management, Inc. and discharged to Ford's wastewater treatment system.

Following plant shutdown in December 2011, purge water and decontamination water were drummed for off-site disposal. One composite sample was collected for characterization from the 55-gallon drums. Laboratory analysis was utilized for offsite disposal and included one or more of the following:

- TCLP VOCs using USEPA Method 1311/8260
- TCLP RCRA Metals using USEPA Method 1311/6010
- Corrosivity using USEPA Method 9045
- Flashpoint using USEPA Method 1010
- pH using USEPA Method 9040C

A site-specific waste characterization profile was also generated for the purge and decontamination water IDW in 2014, and was used for off-site disposal between June 2014 and July 2015. The off-Site disposal was facilitated through Waste Management Inc. (2010-2014) and later MPS Group (2015-2016) and transported to the Spruce Ridge Facility.

5.8.3 PPE and Disposable Sampling Equipment IDW

PPE and disposable sampling equipment were placed in 55-gallon drums and disposed of off-Site after review of subsurface investigation results. A Site-specific waste characterization profile was also generated for the PPE and disposable sampling equipment in 2014 based on analytical results for the soil and purge water and decontamination water IDW. The off-Site disposal was facilitated through Waste Management Inc. (2010-2014) and later MPS Group (2015-2016) and transported to the Spruce Ridge Facility.

5.8.4 Trench IDW

Soil excavated on-Site was staged in lined roll-off containers and covered by polyethylene sheets. All containerized soil awaiting off-site disposal were sampled at the following frequency, which is consistent with MPCA PRP Guidance Document 4-04 Soil Sample Collection and Analysis Procedures (MPCA 2008):

Cubic Yards of Soil	Number of Grab Samples
Less than 50	1
51-500	2
501-1000	3
1001-2000	4
2001-4000	5
Each additional 2,000	One additional sample

The composite samples were utilized for characterization prior to offsite disposal and were analyzed per requirements of the Ford-approved and MPCA-permitted disposal facility. Laboratory analysis of the composite samples included the following:

- PCBs using USEPA Method 8082

- GRO using the WI Modified Method
- DRO using the WI Modified Method
- RCRA Metals using USEPA Method 6010
- TCLP VOCs using USEPA Method 8260 and 1311
- TCLP SVOCs using USEPA Method 8270 and 1311
- TCLP RCRA Metals using USEPA Method 6010 and 1311

MPS Group developed all soil waste profiles pertaining to Area C trench IDW, based on the analytical results, and coordinated transportation and disposal of all hazardous soil with the Heritage Thermal Services, Inc. in East Liverpool, Ohio disposal facility or Clean Harbors Environmental Services, Inc. in Kimball, Nebraska.

5.9 Surveying

All soil borings and groundwater monitoring wells were surveyed for X, Y, and Z (ground surface and top of casing, if applicable) coordinates referencing the National Geodetic Vertical Datum of 1929 and North American Datum of 1983 by Sunde Land Surveying, LLC, a professional Minnesota-certified land surveyor, at the completion of each investigation event.

Trench sampling and terminus locations were collected for X and Y coordinates referencing the World Geodetic System of 1984 using a mobile global positioning system unit and converted to NAD83 coordinates at the completion of each trench.

6 POTENTIAL HUMAN EXPOSURE PATHWAYS

A screening of potential exposures of human and ecological receptors to constituents in the buried industrial waste is presented below. This screening considers potential exposure pathways in the context of current land use scenarios, as well as Site-specific factors. Potential media of concern considered in the screening include soil, industrial waste, groundwater, surface water, and soil vapor. Site-specific risk calculations associated with potential exposure routes (i.e., ingestion, dermal contact, inhalation, etc.) are beyond the scope of this screening level evaluation, but potential routes are discussed below.

The current land use is undeveloped industrial with low frequency and short duration activity (primarily on the parking lot surface) and occasional trespassers along the river bank. The expected future land use ranges from continuation of the current use to limited recreational, which would be restricted through administrative and engineering controls under future redevelopment scenarios. Commercial and/or residential use are not currently contemplated for this Site.

6.1 Potential Soil/Waste Exposure Pathway

The highest concentrations of compounds exceeding MPCA SRVs and PRPs have been detected in samples associated with the industrial waste that was placed at Area C. The majority of industrial waste is covered with 40 to 60 feet of soil and construction debris and then capped at land surface by an approximately 8-inch-thick concrete parking area. The portion of the construction debris fill that is not capped with concrete lies along the northern, western and southern slopes of Area C and is vegetated with dense underbrush. The only location where industrial waste fill is near land surface and within the accessible zone is at the base of the southern slope, in the vicinity of Trenches 1, 2 and 3, where paint sludge was identified approximately 2.5 feet bgs. Exposure of industrial waste due to erosion and slumping of the northern and western slope is not a concern due to large distances between the slope face of the construction debris and the location of the industrial waste (approximately 250 lateral feet behind that slope face on the west side). Erosion at the base of the southern slope could uncover industrial waste that was identified in the vicinity of Trenches 1, 2 and 3. The presence of paint sludge at approximately 2.5 feet bgs at the southern toe of the Area C slope indicates direct exposure to the industrial waste fill is a potentially complete exposure pathway in a limited portion of the Site. This exposure pathway will be further evaluated in Section 9.

As noted above, the fill soil that is present on the northern, western and southern slopes of Area C and that is not covered by a concrete cap is non-native fill soil derived from various construction demolition projects. Exposure to these non-native surficial soils on the slopes of Area C could occur via trespassers that enter the property. Therefore, direct exposure to the surficial soil on the slopes of Area C is considered a completed exposure pathway that requires additional evaluation. An evaluation of this exposure pathway and a comparison of existing analytical results to applicable regulatory standards for direct contact with soil is included in Section 9.

6.2 Potential Groundwater Exposure Pathway

Groundwater samples collected from the upper-most saturated zone surrounding Area C contain compounds at concentrations above the generic Minnesota Department of Health Guidance Values for groundwater. However, Site groundwater is not currently used as a drinking water source, and it is highly unlikely to be used as a source in the future. Also, as documented in the Phase I ESA by Arcadis (Arcadis 2007a), no public water supply wells were observed within a one-mile radius of the Site. No current or future exposure to groundwater by human receptors is expected to occur so exposure to Site groundwater is not considered a potential exposure pathway and will not be evaluated further.

6.3 Potential Surface Water Exposure Pathway

The stretch of the Mississippi River adjacent to the Site is classified as a 2B, 3C, 4A, 5, and 6 water, which includes uses and receptors such as aquatic life, wildlife, recreation, industrial consumption, agricultural, navigation and aesthetics. This stretch of the river is not classified for domestic consumption. Potential releases of impacts associated with Area C to the surface water of the Mississippi River could occur through 1) discharge of groundwater to surface water, and 2) erosion of impacted soil. The potential for each of those discharge pathways to result in a completed exposure pathway is evaluated in additional detail below.

6.3.1 Discharge of Groundwater to Surface Water

During non-flood times, the water table below Area C is typically at an elevation of approximately 689 feet amsl, which is approximately six feet below the lowest observed point of the industrial waste. Based on the elevation of the industrial waste identified during the investigation activities described in Section 5.2 and Section 5.5, and the elevation of the surface water during flood events, there is the potential for groundwater in the unconsolidated sands and gravels below Area C to come into contact with portions of the industrial waste in Area C for short periods of time, should the water table below Area C rise to that extent. Groundwater flow direction in the saturated unconsolidated sands and gravels below Area C generally flows to the west towards the Mississippi River as described in Section 3.2. Based on that general understanding, impacts in this groundwater zone originating from Area C have the potential to discharge to surface water. Therefore, groundwater to surface water discharge is considered a complete exposure pathway that requires additional evaluation. An evaluation of this exposure pathway and a comparison of existing analytical results to applicable regulatory standards for surface water is included in Section 9.

6.3.2 Surficial Soil to Surface Water

Surface water contact with industrial waste or impacted fill soil at the surface of Area C could potentially occur during the course of flooding events when rising surface water expands the river inland along the western and southern slopes of Area C. The contact between flooding surface water and the outer slopes of Area C was observed during the 2014 flooding described in Section 4.5, which was slightly less than the average 10-year flood elevation. Contact between surface water and industrial waste or impacted surficial fill soil could occur if industrial waste or impacted surficial fill soil was present at or near the ground surface up to an elevation of at least the average 100-year flood event. Visual inspections of the

perimeter of Area C have not identified any industrial waste that is present at the land surface. Industrial waste that has been identified through soil borings or trenching activities at the toe of the southern slope of Area C has shown that the industrial waste is currently isolated from the land surface by anywhere from approximately 2.5 feet on the toe of the southern slope on the east side of Area C to greater than 400 feet on the western side of Area C. The industrial waste is isolated by a layer of soil, vegetation and construction debris. No industrial waste has been identified at the land surface of Area C, therefore, exposure of surface water to industrial waste is not considered a viable exposure pathway for impacts to surface water. Because contact between the surface water and surficial fill soil of Area C was observed during the 2014 flooding and is likely to occur again during a future flood event, exposure of surface water to impacted surficial fill soil is considered a potential exposure pathway for impacts to surface water.

6.4 Potential Soil Vapor Exposure Pathway

There are no permanent buildings designed for occupancy near Area C, therefore vapor intrusion is not considered to be a potential exposure pathway and will not be evaluated further. However, if future development scenarios for the Site include the presence of a building designed for occupancy, then evaluation of this pathway and potential risk of inhalation exposure would be required.

7 RISK-BASED SCREENING LEVELS

As part of the comprehensive review of Area C, all data collected at the Site was compared to applicable standards or risk-based screening values for the relevant exposure pathways identified in Section 6.0. Results of the investigation activities were compared to risk-based screening values developed and propagated by the MDH and MPCA. These risk-based levels are only a preliminary screening tool and are not intended to indicate areas of the Site where remediation may be required. Final remediation action levels will be included as part of a Response Action Plan. The risk-based values that will be included in the screening include:

- MPCA SRVs for direct contact with soil
- MPCA PRP Guidance Values for direct contact with petroleum impacted soil
- MDH Health-Based Guidance values for ingestion of groundwater
- MPCA WQS for exposure to surface water (aquatic life and human health via recreational use)

Each of these risk-based screening levels are discussed in more detail below.

7.1 Soil Reference Values

SRVs are a screening tool used to evaluate potential human health risks from direct soil exposure. SRVs were derived by the MPCA using the USEPA Superfund methodology. As stated above, SRVs are intended to be a screening tool to identify areas where direct exposure to soil may cause unacceptable risk to potential receptors. SRVs have been developed for two soil land use categories, residential/recreational and commercial/industrial. Soil analytical data included in Section 8 will be compared to industrial SRVs to match the current and expected long-term land-use for the Site. Residential SRVs are also included in the tables and figures.

7.2 Petroleum Remediation Program Guidance Values

The PRP has provided guidance values for preliminary screening of soil and groundwater impacted with GRO and DRO. The soil guidance value of 100 milligrams per kilogram for GRO and DRO is presented in the document titled Best Management Practices for the Off-Site Reuse of Unregulated Fill (MPCA 2012) and the guidance values for groundwater of 100 micrograms per liter (µg/L) for GRO and DRO was presented during personal communications with Petroleum Brownfields Program staff (Stacey Van Patten pers. com., October 30, 2015).

7.3 MDH Guidance Values for Groundwater

Guidance values for groundwater promulgated by the MDH and adopted by the MPCA include Health Risk Limits, Health Based Values and Risk Assessment Advice. This group of groundwater guidance values will collectively be referred to as MDH-derived values in the context of this report. MDH-derived values are relevant when considering direct exposure to groundwater through ingestion of drinking water. The St. Peter aquifer could potentially be used as a drinking water source; however, there are no water supply wells between the Site and the Mississippi River, nor are there likely to be any in the future. Since this exposure pathway is not relevant, MDH-derived values are generally not the appropriate risk-based

screening standards with which to compare the site groundwater analytical results; however, MDH-derived values are included in the groundwater analytical table and the groundwater figure for reference. The appropriate risk-based screening standards for groundwater are discussed in more detail below.

7.4 Surface Water Quality Standards

Water quality standards (WQSs) for surface water are established by the MPCA for protection of beneficial uses of state water resources. WQSs vary based on the classification (e.g., drinking water, aquatic life, recreation) for each surface water body. The stretch of the Mississippi River adjacent to the Site is classified as a 2B, 3C, 4A, 5, and 6 water. Class 2B (Aquatic Life and Recreation beneficial uses) has the strictest surface water standards of those classes and are therefore utilized as the screening standards for groundwater samples from units that discharge to the Mississippi River.

8 SUMMARY OF INVESTIGATION RESULTS

A complete list of the constituents that have been detected in historical soil samples (prior to 2007) from Area C are included in Table 5. A complete list of current soil analytical results (2015-2016) as compared MPCA SRVs is included in Table 4. A summary of soil analytical MPCA SRV exceedances for the soil boring, hand auger, and trench sample locations are included on Figures 6, 7, and 8, respectively. Cross sections of the five trenches are included in Figures 9a, 9b, 9c, 9d, and 9e, respectively. All soil and groundwater laboratory analytical reports are included in Appendix E

In addition, selected soil samples from the current borings and trenches were analyzed by the TCLP method to determine if the industrial waste is characteristically hazardous. A complete list of current soil analytical results for TCLP VOC, TCLP SVOC, and TCLP Metals compared to TCLP regulatory criteria is included in Table 6.

For the discussions of groundwater analytical results in the sections below, it should be noted that not all nine St. Peter Sandstone monitoring wells at the Ford site will be included, only those wells relevant to Area C. A monitoring well nest on the river parcel (AMW-05 and AMW-05B), located north of the steam plant, is side-gradient to groundwater flow through Area C. Six monitoring wells on the main parcel (AMW-03B; AMW-27 through AMW-31) are upgradient of groundwater flow through Area C. Monitoring well AMW-07, located on the river parcel between Area C and the steam plant, is in closest proximity to Area C and is considered representative of St. Peter Sandstone groundwater quality within Area C. Monitoring wells AMW-29 through AMW-31 are the closest upgradient wells (located along the west side of the main parcel) in relation to Area C. Therefore, discussion of St. Peter Sandstone monitoring wells will be focused on AMW-07, with additional discussion of AMW-05, AMW-05B, and AMW-29 through AMW-31 as needed to support evaluation of whether the groundwater quality in Area C is indicative of conditions originating from Area C or migration from the main parcel. Groundwater analytical results from permanent groundwater monitoring wells and surface water samples are included in Tables 7 and 8, respectively. A comprehensive summary of WQS exceedances for the groundwater and surface water samples are included on Figure 10.

For the discussions of investigation results in the sections below, contaminant classes are divided into the following: chlorinated VOCs, non-chlorinated VOCs, SVOCs, metals, PCBs, GRO/DRO, and cyanide. In addition, the discussions below reference sample locations within the industrial waste fill which include the following sample locations/intervals:

- ASB-1001 (39-42 feet bgs, 50-54 feet bgs, 65-70 feet bgs, 72-74 feet bgs)
- ASB-1002 (55-60 feet bgs, 60-64 feet bgs, 75-77 feet bgs)
- ASB-1004 (60-62 feet bgs)
- ASB-1006 (57-60 feet bgs and 65-67 feet bgs)
- ASB-1007 (62-65 feet bgs and 67-70 feet bgs)
- Trench-01
- Trench-02
- Trench-03

8.1 Chlorinated VOCs

For the purposes of this report, the term “chlorinated VOCs” refers to the following compounds:

- 1,1-Dichloroethane
- 1,1,2-Trichloroethane
- 1,1,1,2-Tetrachloroethane
- 1,1,1-Trichloroethane
- 1,2-Dichloroethane
- Chloroethane
- 1,1,2,2-Tetrachloroethane
- 1,1-Dichloroethene (1,1-DCE)
- *cis*-1,2-Dichloroethene (cis-1,2-DCE)
- Tetrachloroethene (PCE)
- *trans*-1,2-Dichloroethene (trans-1,2-DCE)
- Trichloroethene (TCE)
- Vinyl chloride

8.1.1 Chlorinated VOCs in Soils

A complete list of chlorinated VOC analytical results collected during the most recent round of investigations is included in Table 4. A complete list of historical chlorinated VOC analytical results in soil is included in Table 5. A complete list of current soil analytical results for TCLP VOCs as compared to TCLP regulatory criteria is included in Table 6. A summary of chlorinated VOC results in soil is included on Figures 6, 7, and 8.

Historical test pit TP-3 samples were analyzed using TCLP for VOCs, but no chlorinated VOCs were detected.

Two chlorinated VOCs were detected in Area C soils from current investigations: cis-1,2-DCE and TCE. Eighty-four soil samples were analyzed for VOCs with chlorinated VOCs detected in eight samples from four locations (ASB-1001, ASB-1002, ASB-1004, and ASB-1007). Two of those samples contained chlorinated VOCs at only trace concentrations (i.e., <1 mg/kg). Higher concentrations of chlorinated VOCs were present in the remaining six samples. Chlorinated VOCs were detected in both the industrial waste and the underlying native sand. Two of the six samples collected from within the industrial waste detected chlorinated VOCs at concentrations exceeding their respective industrial SRV. However, the two samples within the native sand which detected chlorinated VOCs were at trace concentrations and did not exceed any of their respective SRVs in soils.

The maximum concentration of cis-1,2-DCE detected was 32 mg/kg (ASB-1001_72-74). The maximum concentration of TCE detected was estimated at 30 mg/kg (ASB-1004_60-62). The laboratory reported an estimated TCE result due to the high concentrations of non-chlorinated VOCs in the sample, which resulted in higher method detection limit. Both detections were from within the industrial waste. See below for a summary of detections.

- ASB-1001 contained concentrations of cis-1,2-DCE in four of the five interval samples (0.053 mg/kg [**39-42** feet bgs], 5.7 mg/kg [**65-70** feet bgs], 32 mg/kg [**72-74** feet bgs], and 0.099 mg/kg [80-82 feet bgs]). ASB-1001 also contained a concentration of TCE in the shallowest sample interval (0.046 mg/kg [**39-42** feet bgs]). Only one detection of cis-1,2-DCE (32 mg/kg [**72-74** feet bgs]) exceeded its Tier II Industrial SRV (22 mg/kg). The cis-1,2-DCE detection in the sample collected below the industrial waste from within the native sand (80-82 feet bgs) did not exceed its respective SRV.
- ASB-1002 contained concentrations of cis-1,2-DCE in two of the five interval samples (7.6 mg/kg [**75-77** feet bgs] and 0.76 mg/kg [80-84 feet bgs]). These same two intervals also contained concentrations of TCE (7.8 mg/kg and 1.1 mg/kg, respectively). None of these detections exceeded their respective SRVs.
- ASB-1004 contained a concentration of cis-1,2-DCE in one of the five interval samples (20 mg/kg [**60-62** feet bgs]). This same interval also contained a concentration of TCE (30 mg/kg). Neither detection exceeded their respective Tier II Industrial SRV.
- ASB-1007 contained a concentration of cis-1,2-DCE in one of the four interval samples (23 mg/kg [**67-70** feet bgs]). This same interval also contained a concentration of TCE (11 mg/kg). Only the detection of cis-1,2-DCE exceeded its Tier II Industrial SRV.

The sample depths listed in bold typeface were collected from within the industrial waste.

No chlorinated VOCs were detected in any of the soil samples collected from the surficial hand auger or trench samples.

Fifty-three soil samples were analyzed for TCLP VOCs from the soil borings and trench investigations described in Section 4.6 above. Of the 53 samples analyzed, chlorinated VOCs were detected in six samples. TCE was the only chlorinated VOC detected. All of the concentrations were less than the TCLP regulatory criteria of 0.5 mg/L, indicating that the industrial waste is not hazardous with respect to chlorinated solvents. See below for a summary of detections.

- ASB-1001 contained a concentration of TCE in one of the five interval samples (0.024 mg/L [**72-74** feet bgs).
- ASB-1002 contained concentrations of TCE in two of the five interval samples (0.17 mg/L [**75-77** feet bgs] and estimated 0.0.24 mg/L [80-84 feet bgs]).
- ASB-1004 contained a concentration of TCE in two of the five interval samples (0.19 mg/kg [**60-62** feet bgs] and estimated 0.2 mg/L [83-85 feet bgs]).
- ASB-1007 contained a concentration of TCE in one of the four interval samples (0.1 mg/L [**67-70** feet bgs]).

The sample depths listed in bold typeface were collected from within the industrial waste.

8.1.2 Chlorinated VOCs in Water

A complete list of the chlorinated VOCs that have been detected in groundwater and surface water at the Site is included in Tables 7 and 8. A summary of chlorinated VOC results is included on Figure 10. The following chlorinated VOCs were detected in site groundwater and/or surface water, but did not exceed their respective WQSs:

- 1,1-DCE

- *cis*-1,2-DCE
- PCE
- trans-1,2-DCE
- TCE
- Vinyl chloride

Area C Overburden: The overburden aquifer in Area C discharges to the Mississippi River, and therefore analytical results are compared to the MPCA Class 2B WQSs.

1,1-DCE had been detected in two of the historical monitoring wells that were installed within Area C (B-1 and B-5). The maximum concentration of 1.5 µg/L was detected at well B-1 in June 1989. There is no MPCA Class 2B WQS for 1,1-DCE. 1,1-DCE has not been detected in any of the 10 current Area C overburden wells.

Cis-1,2-DCE has been detected in three of the six historical monitoring wells and four of the eight current monitoring wells (B-2, B-4, B-6, AMW-21, AMW-22, AMW-22B, and AMW-26). The maximum concentration detected between the three historical monitoring wells was 6.7 µg/L at B-4 in December 1982. The maximum concentration detected in the four current monitoring wells is 1.8 µg/L at AMW-26. There is no MPCA Class 2B WQS for cis-1,2-DCE.

Trans-1,2-DCE had been detected in one historical monitoring well (B-2) at a concentration of 15 µg/L and was an isolated occurrence in March 1982. There is no MPCA Class 2B WQS for trans-1,2-DCE. Trans-1,2-DCE has not been detected in any of the 10 current Area C overburden wells.

TCE had been detected in historical monitoring wells B-1, B-2, and B-6, although not consistently and at low concentrations. The maximum concentration of 5.0 µg/L was detected at well B-2 in March 1982. None of the four detections from the three wells exceed the MPCA Class 2B WQS of 120 µg/L. TCE has not been detected in any of the 10 current Area C overburden wells.

Vinyl chloride had been detected in historical monitoring well B-1 at a concentration of 5.2 µg/L in August 1989 only. This detection did not exceed the MPCA Class 2B WQS of 9.2 µg/L. Vinyl chloride has not been detected in any of the 10 current Area C overburden wells.

St. Peter Sandstone: The St. Peter Sandstone aquifer in Area C discharges to the Mississippi River, and therefore analytical results are compared to the MPCA Class 2B WQSs. As noted at the beginning of Section 8, the evaluation of St. Peter Sandstone aquifer water quality within Area C will be focused on AMW-07 with additional discussion of side-gradient monitoring wells (AMW-05 and AMW-05B) and upgradient monitoring wells (AMW-29 through AMW-31) as needed.

PCE was detected in AMW-07 once during the September 2014 sampling event at an estimated concentration of 0.31 µg/L; no PCE was detected in the previous seven or subsequent two groundwater samples collected from AMW-07. PCE has also been detected in side-gradient monitoring wells AMW-05 and AMW-05B and upgradient monitoring well AMW-30. PCE was detected in AMW-05 during the July and August 2014 sampling events at estimated concentrations of 0.39 µg/L and 0.32 µg/L, respectively. The detection of PCE in AMW-05B was an isolated detection in September 2008 and was detected at a concentration of 3.7 µg/L (AMW-05B). No PCE was detected in the previous three or subsequent five groundwater samples collected from AMW-05B. PCE was detected in AMW-30 during the March and June

2016 sampling events, although at trace concentrations (0.64 µg/L and 0.84 µg/L, respectively). None of the PCE detections exceeded the corresponding WQS of 8.9 µg/L.

TCE has been consistently detected in monitoring well AMW-07 at concentrations ranging from 0.43 µg/L to 2.9 µg/L which is below the WQS of 120 µg/L. TCE has been detected in side-gradient monitoring wells AMW-05 and AMW-05B as well. AMW-05, the shallower of the two nested wells, is often dry during sampling events; however, a temporarily higher water table after the June 2014 flood event allowed samples to be collected from this well in July and August 2014. TCE was detected during the two sampling events at 15 µg/L and 3.2 µg/L, respectively. Of the nine samples collected from AMW-05B, a trace concentration (<1 µg/L) of TCE was detected during two sampling events (August 2014 and June 2016). TCE was also detected during the three sampling events in 2016 at upgradient monitoring wells AMW-29 and AMW-30. TCE was detected at AMW-29 at concentrations between 7.1 µg/L and 11.4 µg/L, and at AMW-30 at concentrations between 22 µg/L and 34 µg/L.

The detections of PCE and TCE in both the side-gradient and the upgradient monitoring wells at concentrations similar to or greater than what has been detected at AMW-07 indicates the PCE and TCE are likely not associated with Area C. It is worth noting that high concentrations of PCE and/or TCE were discovered in soil in two discrete areas on the main parcel in locations upgradient of these wells, and are considered potential sources for the groundwater impacts described above. These two areas are former Worker Pit #1 (PCE 200 mg/kg, TCE 17 mg/kg) and a utility trench (TCE 3,100 mg/kg) (Arcadis 2016d). The contaminated soil in these two areas has been removed as part of response actions completed on the main parcel.

Surface Water: Eight surface water samples have been collected from the Mississippi River between 1982 and 2010 (Figure 2). 1,1-DCE is the only chlorinated VOC that was detected with a maximum concentration of 1.3 µg/L (upstream sample) in June 1989. In August 1989, 1,1-DCE was again detected but in the downstream sample location with a concentration of 1.1 µg/L. There is no MPCA Class 2B WQS for 1,1-DCE.

In summary, no chlorinated VOCs detected to-date in groundwater in the Area C overburden or St. Peter aquifer, which discharge to the Mississippi River, or in the surface water samples from the Mississippi River have exceeded the MPCA Class 2B WQSs.

8.2 Non-Chlorinated VOCs

Non-chlorinated VOCs refers to all VOCs on the USEPA Method 8260 reporting list except those compounds that are explicitly listed in Section 8.1.

8.2.1 Non-Chlorinated VOCs in Soil

A complete list of non-chlorinated VOC analytical results collected during the most recent round of investigations is included in Table 4. A complete list of historical non-chlorinated VOC analytical results is included in Table 5. A complete list of current soil analytical results for TCLP VOCs as compared to TCLP regulatory criteria is included in Table 6. A summary of non-chlorinated VOC results in soil is included on Figures 6, 7, and 8.

Historical test pit TP-3 samples were analyzed using TCLP for VOCs. Four non-chlorinated VOCs were detected (toluene, ethylbenzene, m-xylene and o & p-xylene) but did not exceed applicable USEPA TCLP or Tier II Industrial SRV criteria.

Soil concentrations of non-chlorinated VOCs exceeding their respective industrial SRVs were detected at the following locations from current investigations:

- Boring locations ASB-1001, ASB-1002, ASB-1004, ASB-1007 and ASB-1008
- Trenches 2 and 3

Eighty-four soil samples were analyzed for VOCs. Of the 84 samples analyzed, non-chlorinated VOCs were detected at concentrations exceeding their respective Tier II Industrial SRVs in 16 samples. Eleven of the 16 samples were from the five boring locations listed above and the remaining five were from samples collected from the two trenches. No surficial soil samples analyzed for non-chlorinated VOCs exceeded their respective Industrial SRVs.

Samples collected from within the industrial waste at four of the five boring locations (ASB-1001, ASB-1002, ASB-1004, and ASB-1007) as well as the two trenches, detected concentrations of the following non-chlorinated VOCs exceeding their respective Tier II Industrial SRVs: 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, toluene, and total xylenes. The following constituents were also detected above their respective Tier II Industrial SRVs within the native sand below the industrial waste: 1,2,4-trimethylbenzene and 1,3,5-trimethylbenzene.

The remaining boring location (ASB-1008) is outside the industrial waste footprint and detected naphthalene at a concentration exceeding its respective Tier II Industrial SRV in the fill soil.

Fifty-three soil samples were analyzed for TCLP VOCs from the soil borings and trench investigations described in Section 4.6 above. Of the 53 samples analyzed, non-chlorinated VOCs were detected in 12 samples. Methyl ethyl ketone (2-butanone) and benzene were the only non-chlorinated VOCs detected. All of the concentrations were less than their respective TCLP regulatory criteria of 200 mg/L and 0.5 mg/L, respectively, indicating that the industrial waste is not hazardous with respect to non-chlorinated VOCs.

8.2.2 Non-Chlorinated VOCs in Water

A complete list of the non-chlorinated VOCs that have been detected in groundwater and surface water at the Site is included in Tables 7 and 8. A summary of non-chlorinated VOC results is included on Figure 10.

Area C Overburden: Non-chlorinated VOC detections at the historical monitoring well locations were isolated and at concentrations below their respective WQSs. Non-chlorinated VOC detections at nine of the 10 current monitoring wells have been isolated and at concentrations below their respective WQS. Ethylbenzene was detected at AMW-25 during both sampling events at concentrations exceeding the WQS of 68 µg/L (120 µg/L and 95 µg/L, respectively). However, ethylbenzene was not detected in the downgradient wells (AMW-24, AMW-23, AMW-23B and AMW-20). No other non-chlorinated VOCs were detected above their respective WQS in the Area C overburden.

St. Peter Sandstone: Non-chlorinated VOCs were detected sporadically in AMW-07 at concentrations below their respective WQSs. Isolated detections of non-chlorinated VOCs were also detected in side-gradient monitoring wells AMW-05 and AMW-05B and upgradient monitoring wells AMW-30 and AMW-31 at concentrations below their respective WQSs. Non-chlorinated VOCs were not detected in the remaining upgradient well (AMW-29).

Surface Water: Non-chlorinated VOC detections in the surface water samples have been isolated and at concentrations below their respective WQSs.

In summary, non-chlorinated VOCs do not appear to be a significant contaminant of concern in groundwater within the Area C overburden or St. Peter Sandstone aquifers at the Site. The WQS exceedances of ethylbenzene detected at AMW-25 within the Area C overburden were not detected in downgradient monitoring wells during the corresponding sampling events.

8.3 SVOCs

8.3.1 SVOCs in Soil

A complete list of SVOC analytical results collected during the most recent round of investigations is included in Table 4. A complete list of current soil analytical results for TCLP SVOCs as compared to TCLP regulatory criteria is included in Table 6. A summary of SVOC results in soil is included on Figures 6, 7, and 8. Soil concentrations of SVOCs exceeding their respective Tier II Industrial SRVs were detected at the following locations:

- Boring locations ASB-1001, ASB-1002, ASB-1003, ASB-1004, ASB-1006, ASB-1007, ASB-1008, ASB-1009, and ASB-1010
- Surficial locations HA-16, HA-27, and HA-31
- Trenches 1, 2, and 3.

Eighty-four soil samples were analyzed for SVOCs. Of the 84 samples analyzed, SVOCs were detected at concentrations exceeding their respective Tier II Industrial SRVs in 26 samples. Fourteen of the 26 samples were from the nine boring locations listed above, three were from surface sample locations, and the remaining nine samples were from the three trenches.

Samples collected from within the industrial waste at five of the nine boring locations (ASB-1001, ASB-1002, ASB-1004, ASB-1006, and ASB-1007) and three trenches detected concentrations exceeding their respective Tier II Industrial SRVs for the following constituents: 2-methylnaphthalene, naphthalene, and benzo(a)pyrene equivalents. Naphthalene was also detected above its respective Tier II Industrial SRV below the industrial waste within the native sand at ASB-1002.

Samples collected from fill soils outside of the industrial waste footprint at three boring locations (ASB-1008, ASB-1009, and ASB-1010) and the three surficial locations (HA-16, HA-27, and HA-31) detected concentrations exceeding their respective Tier II Industrial SRVs for naphthalene and benzo(a)pyrene equivalents. For the remaining boring location (ASB-1003) within the native sand below the fill soil, benzo(a)pyrene equivalents was the only constituent which exceeded its respective Tier II Industrial SRV.

Fifty-three soil samples were analyzed for TCLP SVOCs from the soil borings and trench investigations described in Section 4.6 above. Of the 53 samples analyzed, SVOCs were detected in 19 samples. 2-methylphenol, 3-methylphenol/4-methylphenol, pentachlorophenol, and pyridine were the only SVOCs detected. All of the concentrations were less than their respective TCLP regulatory criteria, if applicable, indicating that the industrial waste is not hazardous with respect to SVOCs.

8.3.2 SVOCs in Water

A complete list of the SVOCs that have been detected in groundwater at the Site is included in Table 7. A summary of SVOC results is included on Figure 10.

Area C Overburden: SVOCs were not analyzed during groundwater sampling events for the historical monitoring wells. The 10 current monitoring wells have been sampled twice for SVOCs. SVOCs have been detected at seven of the monitoring wells. The following SVOCs have been detected in overburden groundwater: anthracene, bis(2-ethylhexyl)phthalate, fluoranthene, and phenanthrene. Of the seven wells with detections, concentrations at five wells did not exceed their respective WQSs.

Anthracene and bis(2-ethylhexyl)phthalate were detected exceeding the WQS at AMW-21 in one sampling event (June 2016) at concentrations of 0.25 µg/L and 6.0 µg/L, respectively. AMW-22 and AMW-22B are downgradient of AMW-21, and did not detect either constituent during the same sampling event. Neither anthracene nor bis(2-ethylhexyl)phthalate were detected in AMW-21 during the preceding sampling event (March 2016).

Anthracene, bis(2-ethylhexyl)phthalate, fluoranthene and phenanthrene were detected exceeding the WQS at AMW-26 (1.3 µg/L, 2.3 µg/L, 4.1 µg/L, and 5.2 µg/L, respectively) during the March and/or June 2016 sampling event. However, AMW-19, AMW-20, AMW-23 and AMW-23B are downgradient of AMW-26 and did not detect any of the four constituents. No other SVOCs were detected above their respective WQSs in the Area C overburden.

St. Peter Sandstone: Only two of the six monitoring wells (AMW-07 and AMW-05B) have been sampled for SVOCs, with isolated and trace concentrations detected at AMW-07 only. AMW-07 detected anthracene in June 2016 (0.20 µg/L) and was above the WQS of 0.035 µg/L. Samples collected from AMW-07 before 2016 were non-detect. No other SVOCs have been detected above their respective WQS. Anthracene was frequently detected in samples collected from the industrial waste within Area C, although at concentrations below the Industrial SRV and in groundwater samples collected from the Area C overburden. Therefore, the exceedance of anthracene at AMW-07 in June 2016 is potentially associated with Area C.

Surface Water: SVOCs were not analyzed during the historical surface water sampling events. However, SVOC detections in the 2010 surface water samples were isolated and at concentrations below their respective WQSs.

In summary, SVOCs appear to be a contaminant of concern in the industrial waste and within limited portions of the surficial soil, overburden groundwater and St. Peter Sandstone aquifers. Groundwater samples from two Area C overburden wells (AMW-21 and AMW-26) and one St. Peter Sandstone well (AMW-07) exceed the WQS during the most recent sampling event (June 2016) for one or more of the following: anthracene, bis(2-ethylhexyl)phthalate, fluoranthene and phenanthrene. However, Area C overburden downgradient wells did not detect these same constituents at concentrations exceeding the

respective WQS. An evaluation of the interaction between groundwater in the St. Peter aquifer and the adjacent Mississippi River is included in Section 9 below.

8.4 Metals

8.4.1 Metals in Soil

A complete list of metal analytical results collected during the most recent round of investigations is included in Table 4. A complete list of historical metal analytical results is included in Table 5. A complete list of current soil analytical results for TCLP Metals as compared to TCLP regulatory standards is included in Table 6. A summary of metal results in soil is included on Figures 6, 7, and 8.

Based on email correspondence with the MPCA dated February 6, 2017, iron and vanadium concentrations were compared to their respective pending revised SRVs. Utilizing the pending revised SRVs eliminates false exceedances due to potential background concentrations. The iron and vanadium results included on Figures 6, 7, and 8 as well as Tables 4 and 5 (if applicable), illustrate the analytical results as compared to their respective pending revised SRVs.

One soil sample was collected from each of the historical test pits TP-3 and TP-8 and analyzed for TCLP metals, as noted in Section 4.2 above. Neither of the samples detected metals at concentrations exceeding USEPA TCLP levels.

Metal concentrations exceeding their respective Tier II Industrial SRVs were detected at the following locations:

- Boring locations ASB-1001, ASB-1002, ASB-1004, and ASB-1007
- Trenches 1, 2, and 3

Eighty-four soil samples were analyzed for metals as described in Section 4.6 above. Of the 84 samples analyzed, metals were detected at concentrations exceeding their respective industrial SRVs in 16 samples. Eight of the 16 samples were from the four boring locations listed above (ASB-1001, ASB-1002, ASB-1004, and ASB-1007) and the remaining eight were from the three trenches. All of the metals exceedances were associated with the industrial waste.

Constituents detected above their respective Tier II Industrial SRVs include: antimony, arsenic, barium, lead, and mercury.

Fifty-three soil samples were analyzed for TCLP metals from the soil borings and trench investigations described in Section 4.6 above. Twenty-three of the samples were collected from industrial waste, 17 samples were collected from fill soil and 13 samples were collected from native soil. Of the 53 samples analyzed, lead exceeded its TCLP regulatory criteria in 13 samples, with all but one associated with the industrial waste. One lead TCLP exceedance was associated with the fill soil (ASB-1005). No other metals exceeded their respective TCLP limit. The 13 samples that exceeded the lead TCLP regulatory criteria were collected from intervals with elevated PID readings and solvent-like odors, and indicate that these intervals of the industrial waste and fill soil are characteristically hazardous for lead.

8.4.2 Metals in Water

Dissolved metals are the preferred analytical method when discussing metals concentrations in groundwater. A complete list of the total and dissolved metals that have been detected at the Site in groundwater and surface water is included in Tables 7 and 8, respectively. A summary of dissolved metals results in groundwater is included on Figure 10.

Area C Overburden: The following dissolved metals had been detected in one or more of the historical monitoring wells at concentrations above their applicable WQSs: cadmium (2 to 20 µg/L), copper (14 to 30 µg/L), lead (7 to 60 µg/L), and zinc (174 to 260 µg/L).

Cadmium had been detected in four of the historical monitoring wells (B-1, B-2, B-3 and B-4) at concentrations exceeding the MPCA Class 2B WQS, with a maximum concentration of 20 µg/L at both B-1 and B-4 in March 1982. Cadmium was not detected in the five subsequent sampling events at B-1. Cadmium also exceeded criteria at both B-2 and B-3 as an isolated occurrence in December 1982. Cadmium was either not detected or was present at concentrations below criteria during the five subsequent sampling events at B-3. None of the other detections of cadmium exceeded WQS. Historical monitoring wells B-2 and B-4 were not sampled after 1982.

Copper had been detected in three of the historical monitoring wells (B-1, B-2, and B-3) at concentrations of 30 µg/L (March 1982), 20 µg/L (March 1982), and 20 µg/L (August 1989), respectively. These concentrations exceeded the MPCA Class 2B WQS. Each of the exceedances was an isolated event. No other copper detections exceeded MPCA Class 2B WQS in subsequent sampling event(s).

Lead had been detected in two of the historical monitoring wells (B-1 and B-4) at concentrations of 120 µg/L and 60 µg/L, respectively, in March 1982. Both concentrations exceeded the MPCA Class 2B WQS. Each of the exceedances was an isolated event in March 1982. No other lead detections exceeded MPCA Class 2B WQS in subsequent sampling event(s).

Zinc had been detected in one historical monitoring wells (B-5) at a concentration exceeding the MPCA Class 2B WQS in an isolated event. Zinc exceeded criteria at a concentration of 260 µg/L in September 1989. Historical monitoring well B-5 was not sampled after 1989.

Dissolved metals have been consistently detected at all 10 current overburden monitoring wells. The following metals were detected at concentrations exceeding the MPCA Class 2B WQS:

- Cobalt was detected at concentrations exceeding the MPCA Class 2B WQS of 2.8 µg/L at AMW-20 during two sampling events (November 2011 and January 2012) at concentrations of 9.9 µg/L and an estimated 6.4 µg/L, respectively, but did not exceed the standard during the other four sampling events. Cobalt was detected in most soil samples that were collected from the industrial waste, but was not detected above the Tier 2 Industrial SRVs. The presence of cobalt in the industrial waste indicates the waste is a potential source for the cobalt detected in groundwater. Cobalt will be included in additional evaluation for the potential impact to surface water included in Section 9.4
- Mercury was detected exceeding its MPCA Class 2B WQS of 0.0069 µg/L once during the March 2016 sampling event for the following locations: AMW-19, AMW-20, AMW-23B, and AMW-24. The concentrations ranged from an estimated 0.16 µg/L to 0.27 µg/L. Subsequent samples in June 2016 were non-detect. Mercury was detected sporadically in soil samples that were collected from the industrial waste and exceeded the Tier 2 Industrial SRV in one sample collected from ASB-1001. The

presence of mercury in the industrial waste indicates the waste is a potential source for the mercury detected in groundwater. Cobalt will be included in additional evaluation for the potential impact to surface water included in Section 9.4

- Thallium was the only dissolved metal to be detected exceeding its MPCA Class 2B WQS of 0.56 µg/L at least once for the following locations: AMW-19, AMW-20, AMW-21, AMW-22, AMW-23, AMW-24, AMW-25 and AMW-26. Concentrations ranged from an estimated 2.4 µg/L to 10 µg/L. Thallium was detected only at estimated concentrations in a few of the soil sampled collected from the industrial waste, which suggests the thallium detected in groundwater is likely not originating from the industrial waste, however, thallium will be retained as a potential contaminant of concern and will be included in additional evaluation for the potential impact to surface water included in Section 9.4

No other dissolved metal was detected at concentrations that exceeded applicable MPCA Class 2B WQSs.

St. Peter Sandstone: Dissolved metals aluminum and cobalt have each been detected in AMW-07 at concentrations above their applicable WQSs.

Aluminum was detected in AMW-07 above the WQS of 125 µg/L in samples collected in August 2014, September 2014, and June 2016, with a maximum concentration of 340 µg/L (June 2016). Upgradient wells AMW-29 and AMW-30 also detected aluminum at concentrations above the WQS for each sampling event in 2016 (February, March, and June), with a maximum concentration of 29,000 µg/L at AMW-30 (June 2016). The exceedances of dissolved aluminum in the upgradient monitoring wells indicate the exceedances at AMW-07 appear to be associated with possible migration from the main parcel. The concentration of aluminum detected in soil sampled collected from Area C were within the range of background values that can be expected to occur naturally, which is an additional line of evidence that aluminum detected in groundwater at AMW-07 is not originating from Area C.

Cobalt was detected in AMW-07 above its WQS of 5 µg/L in samples collected in August 2014, September 2014, March 2016, and June 2016, with a maximum concentration of 11 µg/L (June 2016). Side-gradient well AMW-05B also detected cobalt at concentrations above the WQS in August 2014, September 2014, and June 2016 with a maximum estimated concentration of 6.5 µg/L (June 2016). Upgradient wells AMW-29 and AMW-30 also detected cobalt at concentrations above the WQS for each sampling event in 2016 (February, March, and June), with a maximum concentration of 75 µg/L at AMW-29 (June 2016). The exceedances of dissolved cobalt in the side-gradient and upgradient monitoring wells indicate the exceedances at AMW-07 do not appear to be associated with Area C.

Overall, dissolved metals have been consistently detected at AMW-07, however, those compounds were also consistently detected at upgradient or sidegradient Area C wells at similar or higher concentrations.

Surface Water: Metal detections in the surface water samples have been isolated and at concentrations below their respective WQSs.

In summary, select metals appear to be a contaminant of concern in the industrial waste and in portions of the Area C overburden aquifer. An evaluation of the interaction between groundwater in the St. Peter aquifer and the adjacent Mississippi River is included in Section 9 below.

8.5 PCBs

8.5.1 PCBs in Soil

A complete list of PCB analytical results collected during the most recent round of investigations is included in Table 4. A summary of PCB results in soil is included on Figures 6, 7, and 8.

Seven soil samples have been analyzed for PCBs as described in Section 4.6 above. Of the seven samples analyzed, PCBs were detected in seven samples at concentrations ranging from 0.196 mg/kg to 13 mg/kg. PCBs exceeded its respective Tier II Industrial SRV in one sample. The location of this sample is within the industrial waste at Trench 3 as illustrated on Figures 8 and 9c.

8.5.2 PCBs in Water

A complete list of the PCBs that have been detected in groundwater at the Site is included in Table 7. A summary of PCB results in groundwater is included on Figure 10.

Area C Overburden: PCBs were not analyzed during groundwater sampling events for the historical monitoring wells. In accordance with the Area C Investigation Work Plan (Arcadis 2015b) and the Work Plan for Site-Wide Groundwater Sampling of Permanent Monitoring Wells (Arcadis 2016b), PCB samples have not been collected from the eight new monitoring wells screened in the Area C overburden.

St. Peter Sandstone: Each of the St. Peter monitoring wells have been sampled for PCBs during at least two sampling events with the exception of AMW-05, which was dry during most sampling events. PCBs have been detected at concentrations exceeding the WQSs of 0.000029 µg/L at AMW-07 and AMW-05B. Aroclor 1260 was detected at an estimated concentration of 0.059 µg/L at AMW-07 and Aroclor 1254 was detected at a concentration of 0.97 µg/L at AMW-05B in September 2008. No other detectable concentrations of PCBs were identified in either well, which indicates that the September 2008 detection was isolated in nature.

The detections of PCBs at concentrations exceeding their applicable WQSs in AMW-07 as well as side-gradient well AMW-05B during an isolated event in September 2008 indicate the exceedances do not appear to be associated with Area C.

In summary, PCBs do not appear to be a significant contaminant of concern in groundwater at the Site.

8.6 GRO/DRO

8.6.1 GRO/DRO in Soil

A complete list of GRO/DRO analytical results collected during the most recent round of investigations is included in Table 4. A summary of GRO/DRO results in soil is included on Figures 6, 7, and 8.

Both GRO and DRO were detected above the PRP Guidance Value of 100 mg/kg. Of these detections, concentrations exceeding the PRP Guidance Value were detected at the following locations:

- Boring locations ASB-1001, ASB-1002, ASB-1003, ASB-1004, ASB-1006, ASB-1007, ASB-1008, and ASB-1010

- Surficial locations HA-06, HA-16, HA-19, and HA-27 through HA-31
- Trenches 1, 2, and 3.

Eighty-four soil samples have been analyzed for GRO and/or DRO. GRO concentrations in the borings range from 2.8 to 21,000 mg/kg and DRO concentrations range from 6.3 to 37,000 mg/kg. GRO concentrations in the surficial samples collected from the slope of Area C range from non-detect to 7.9 mg/kg and DRO concentrations range from 120 to 2,300 mg/kg. GRO concentrations in the trenches range from non-detect to 19,000 mg/kg and DRO concentrations range from non-detect to 42,000 mg/kg.

Eight surficial soil samples (HA-06, HA-16, HA-19 and HA-27 through HA-31) contained DRO at concentrations above the PRP Guidance Values of 100 mg/kg. Concentrations in the soil samples generally varied from between 120 mg/kg up to 350 mg/kg, with the exception of HA-16, which detected DRO at 2,300 mg/kg. HA-06, HA-16 and HA-19 have adjacent samples where no DRO exceedances were detected, so these exceedances are considered to be discrete and not representative of large scale impacts in the surficial soil. The remaining soil sample locations (HA-27 through HA-31) were all collected from a vertical transect near the southeast corner of Area C. They are co-located with two of the samples where BaP equivalents exceeded industrial SRVs and may be representative of a pocket of impacted soil present near the surface of Area C.

8.6.2 GRO/DRO in Water

GRO and DRO concentrations were compared to MPCA-specified screening levels of 100 µg/L for both GRO and DRO for drinking water; however, there are no drinking water receptors and no WQS standards for GRO or DRO. A complete list of GRO and DRO detections in groundwater at the Site is included in Table 7. A summary of GRO/DRO results in groundwater are included on Figure 10.

Area C Overburden: GRO and DRO were not analyzed during groundwater sampling events for the historical monitoring wells. The current 10 monitoring wells have been sampled for GRO/DRO on at least two sampling events. GRO and DRO have both been detected in the Area C overburden with concentrations exceeding 100 µg/L.

GRO was detected in three of the ten wells (AMW-23, AMW-23B, and AMW-25) during the June 2016 sampling event, but only exceeded the screening level at AMW-25 with a concentration of 10,000 µg/L.

DRO has been detected in eight of the ten wells (AMW-19, AMW-20, AMW-21, AMW-22B, AMW-23, AMW-24, AMW-25, and AMW-26) between 2011 and 2016 with exceedances ranging from 110 µg/L to 11,000 µg/L. Concentrations of DRO detected in AMW-22B have been lower than detections in upgradient AMW-21. In addition, concentrations of DRO detected in AMW-19 and AMW-20 did not exceed the specified screening level in the most recent sampling event in June 2016, and both are downgradient of monitoring wells with DRO concentration exceedances. Specifically, AMW-19 is downgradient of AMW-26 while AMW-20 is downgradient of AMW-23, AMW-24, and AMW-25.

St. Peter Sandstone: GRO has not been detected in the St. Peter Sandstone within Area C whereas DRO has been detected at concentrations exceeding 100 µg/L.

GRO has been analyzed during four of the 10 sampling events at AMW-07 between 2007 and 2016 but was below detection limits in each sample.

DRO has been analyzed during five of the 10 sampling events at AMW-07. Concentrations range from 130 µg/L (March 2008 and June 2016) to 210 µg/L (September 2008). DRO was also detected at side-gradient well AMW-05B at a concentration exceeding the MPCA screening level (180 µg/L) in June 2016. Additionally, DRO has been detected at all three upgradient monitoring wells at concentrations exceeding the MPCA screening level, ranging from 180 µg/L to 2,600 µg/L. The two locations with the highest concentrations (AMW-29 and AMW-31) correspond with locations on the main parcel that have been previously identified as impacted with DRO in soil.

The detections of DRO at concentrations exceeding its applicable screening level in both side-gradient and upgradient monitoring wells indicate the exceedances at AMW-07 do not appear to be associated with Area C, but rather appear to be associated with migration from upgradient sources.

In summary, GRO and DRO appear to be detected across the Site. Of the 16 permanent monitoring wells that have been sampled to date for GRO and/or DRO, detections exceeded applicable criteria at 15 wells. As noted above, there are no drinking water receptors at the Site and there are no WQS standards for GRO or DRO because petroleum compounds are typically evaluated on a contaminant specific basis (e.g., benzene).

8.7 Cyanide

No cyanide sampling was completed in the soil during this Area C investigation.

8.7.1 Cyanide in Water

A complete list of cyanide detections in site groundwater is included in Table 7. A summary of cyanide results in groundwater is included on Figure 10.

Area C Overburden: Cyanide was not analyzed during groundwater sampling events for the historical monitoring wells. Cyanide was collected for one sampling event (June 2016) and detected in three of the 10 current monitoring wells (AMW-22, AMW-23, and AMW-24). Each of the detections exceeded the applicable WQS of 5.2 µg/L for free cyanide at concentrations of 15 µg/L, 14 µg/L, and 13 µg/L, respectively. AMW-20 is downgradient of AMW-23 and AMW-24 and did not detect cyanide during the same sampling event. There is no monitoring well down gradient of AMW-22.

St. Peter Sandstone: Cyanide was detected in AMW-07 at an estimated concentration of 5.9 µg/L in March 2008, which exceeded the MPCA Class 2B WQS for free cyanide. Cyanide was not detected in AMW-07 during subsequent sampling events completed in September 2008 and June 2016. Cyanide was detected on the main parcel at AMW-29 at an estimated concentration of 6.5 µg/L in a sample collected in June 2016. This concentration is also above the applicable WQS for free cyanide and is located upgradient of AMW-07, which did not detect cyanide during that time. No other St. Peter Sandstone monitoring wells detected cyanide.

The detections of free cyanide at concentrations exceeding its applicable screening level in an upgradient monitoring well indicate detections in AMW-07 appear to be associated with migration from the main parcel.

In summary, cyanide is a contaminant of concern in only limited areas of the Area C overburden. An evaluation of the interaction between groundwater in the St. Peter aquifer and the adjacent Mississippi River is included in Section 9 below.

9 DATA EVALUATION AND EXPOSURE PATHWAY ASSESSMENT

9.1 Direct Contact with Industrial Fill

As noted in Section 6.1 the vertical borings and test trenches completed within and on the southern boundary of Area C indicates the industrial waste is generally isolated from the north and west surface of Area C by a buffer of fill soil and construction debris. Industrial waste (paint sludge) was identified in Test Trenches 1, 2 and 3 (Figures 9a through 9c) within 2.5 feet of the ground surface on the southern toe of the Area C slope. The presence of industrial waste in that location does not present an immediate risk to potential receptors, however, the waste is present within the accessible zone which is defined as the soil horizon from zero to four feet bgs in the MPCA Property Use Guidance (MPCA 2016). As noted in Section 8, soil samples collected from this industrial waste exceeded industrial SRVs. Industrial waste within the accessible zone with contaminant concentrations exceeding industrial SRVs represents a potentially completed exposure pathway with an unacceptable level of long-term risk. A Feasibility Study for potential remedial actions to eliminate this completed exposure pathway will be completed.

9.2 Direct Contact with Surficial Fill Soil

Exposure to non-native surficial soils on the slopes of Area C could occur via trespassers that enter the property. To evaluate risk associated with this exposure pathway the results of the surficial soil sampling discussed in Section 8 were compared to SRVs. As discussed in Section 8, BaP equivalents at concentrations exceeding its Industrial SRVs was detected, at three locations (HA-16, HA-27, and HA-31) and DRO exceeding the PR Guidance Value was detected at eight locations (HA-06, HA-16, HA-19, and HA-27 through HA-31). Additionally, there is construction debris including concrete and chunks of metal at the surface of Area C that present a potential physical hazard to trespassers in the area.

Surficial soil with contaminant concentrations exceeding Industrial SRVs and PRP guidance values represents a potentially completed exposure pathway with an unacceptable level of long-term risk. A Feasibility Study for potential remedial actions to eliminate this completed exposure pathway will be completed.

9.3 Surficial Fill Soil to Surface Water

Exposure of surface water to impacted surficial fill soil at Area C could occur during flood events when surface water rises and comes into contact with the lower slopes of Area C. To evaluate risk associated with this exposure pathway results of surficial soil samples that were collected from below the 100-year flood elevation (717 ft amsl) were reviewed for analytical detections that may result in impacts to surface water. Three surficial soil samples (HA-22, HA-26 and HA-31) were collected from below the 100-year flood level. Only HA-31 was noted as having detections in excess of what was commonly detected at all locations (BaP equivalents and DRO). There are no surface water standards for either of those compounds that were detected at HA-31. Therefore, contact between surface water and impacted surficial soil is a potentially completed exposure pathway that does not appear to present an unacceptable risk.

9.4 Leaching Potential of Industrial Waste

As discussed in Section 8.6.2 and 8.6.3, the presence of industrial waste has been confirmed within Area C. The elevation of the industrial waste is variable, but was noted as deep as approximately 695 feet amsl. The typical elevation of the Mississippi River is approximately 689 feet amsl, which is below the bottom of the industrial waste, however, the river elevation during 10-, 50- and 100-year floods increases to 707 feet amsl, 714 feet amsl and 717 feet amsl, respectively. It is unlikely that the groundwater would rise at the same rate as surface water, rather there would likely be a delay in the timing of the rise in groundwater elevation and the total magnitude of the rise would be muted relative to the surface water.

The following soil samples collected from soil borings and test trenches (discussed in Section 8) were collected from elevations that would potentially be saturated during flooding events, assuming the rise in the water table below Area C mirrored the river elevation:

ASB-1001: **65-70, 72-74** and 80-82 feet bgs

ASB-1002: **55-60, 60-64, 75-77, 80-84** and 92-95 feet bgs

ASB-1003: 60-64, 70-74 feet bgs

ASB-1004**: 60-62, 69-70,** 79-80 and 83-85 feet bgs

ASB-1005: 78-80 feet bgs

ASB-1006: 52-54, **57-60, 65-67** and 78-80 feet bgs

ASB-1007: 62-65, **67-70** and 75-77 feet bgs

ASB-1008: 52-54 and 70-72 feet bgs

ASB-1009: 55-57, 62-65 and 70-72 feet bgs

ASB-1010: 55-57 and 70-73 feet bgs

Trench 1: **10 feet @ 4-5 feet bgs**, 10 feet @ 5-6 feet bgs, 15 feet @ 5-6 feet bgs

Trench 2: **0 feet @ 9-10 feet bgs**, **0 feet @ 12-13 feet bgs**, **8 feet @ 4-5 feet bgs**, **13 feet @ 6-7 feet bgs**, **15 feet @ 6-7 feet bgs**

Trench 3: **7 feet @ 3-4 feet bgs**, **10 feet @ 9-10 feet bgs**, **22 feet @ 2-3 feet bgs**

The sample depths listed in bold typeface were collected from within the industrial waste.

The concrete parking lot which caps much of the industrial waste and the vertical separation between the bottom of the waste and the water table limit the leaching potential of the industrial waste under typical river conditions. A limited number of SVOCs and dissolved metals have been detected in groundwater at concentrations exceeding the applicable WQS values. These compounds were also detected in the industrial waste samples in Area C, which suggest leaching of the compounds from the waste is a potential ongoing source to the groundwater, which may be increased if water levels beneath Area C increase as a result of a Mississippi River flooding event. The actual compounds and concentrations that have been detected in groundwater at Area C and a subsequent evaluation of the surface water exposure pathway is evaluated in additional detail below.

9.5 Discharge of Groundwater to Surface Water

The potential for groundwater to impact surface water at concentrations that would exceed applicable regulatory standards for surface water was evaluated in accordance with the tiered approach recommended in the *Surface Water Pathway Evaluation User's Guide* developed by the MPCA. A summary of the tiered evaluation is described in the following sections.

9.5.1 Tier 1 Site Evaluation

A Tier 1 evaluation is a simple comparison of groundwater analytical results to the most conservative standards that are applicable for a particular stream classification. The minimal data needs for a Tier 1 evaluation of the groundwater to surface water exposure pathway includes identification of a surface water body that received groundwater discharge (Mississippi River), a complete list of contaminants of potential concern (COPC), the highest concentration of each COPC just upgradient of the point where groundwater discharges to the surface water body, a detailed understanding of the geology, definition of the groundwater plume, and knowledge that the source has been removed, contained, or treated so that it will not affect plume stability in the future.

All the data required for a Tier 1 evaluation was available, so Table 8 of the *Surface Water Pathway Evaluation User's Guide* was used to evaluate the groundwater concentrations present at the Site. Groundwater results from monitoring wells AMW-19, AMW-20, AMW-22 and AMW-22B were selected as the monitoring points that were immediately upgradient of the discharge point to the Mississippi River. Appendix 3 of the *Surface Water Pathway Evaluation User's Guide* was used to obtain a conservative natural hardness value for screening hardness dependent metals. The highest historical analytical value that has been detected for each constituent at the four monitoring wells listed above was entered into Table 8 of the *Surface Water Pathway Evaluation User's Guide*. As discussed in Section 9.3, there is the potential for higher groundwater concentrations based on leaching of impacts from the industrial waste during flood events, however, those higher concentrations have not been observed in downgradient monitoring wells even during high frequency sampling that was completed after the most recent flood event (Section 4.6).

Results of the Tier 1 evaluation indicated seven metals (barium, cobalt, iron, manganese, mercury, thallium and vanadium) as well as cyanide exceeded the Tier 1 screening number. Only barium, cobalt and mercury were detected in soil samples collected from the industrial waste at elevated concentrations relative to non-waste samples, however, all compounds were retained for a Tier 2 evaluation. A copy of Table 8 from the *Surface Water Pathway Evaluation User's Guide* is included in Appendix N.

9.5.2 Tier 2 Site Evaluation

A Tier 2 evaluation is a more detailed evaluation of a water body using site-specific values to account for groundwater flux to the surface water body and dilution into the base stream flow. In addition to the minimal data needs for a Tier 1 evaluation, the minimal data needs for a Tier 2 evaluation include the groundwater flow direction and velocity, the plume stability, the minimum 7-day average flowrate measured over a ten-year period (7Q10 value) of the surface water receptor, and the plume width and thickness measured in feet.

The groundwater flow direction was assumed to be perpendicular to the Mississippi River in order to provide a conservative estimate of groundwater flux. A groundwater velocity of 1.7 ft/day for the area was taken from historical reports for the Site (CRA 1998). A 7Q10 value of 1,253 cubic feet per second was obtained from MPCA EAO staff. Documentation of the value is provided in Appendix O. A total plume width of 850 feet was used which would span the entire western boundary of Area C where it meets the Mississippi River. The plume thickness was assumed to be the entire saturated thickness of the unconsolidated floodplain material where the monitoring wells are installed, which is equal to approximately 19 feet, as shown on Figure 3A.

Each of those values was entered into Table 11 of the *Surface Water Pathway Evaluation User's Guide.* The downstream concentration of each compound that exceeded the Tier 1 evaluation was calculated using the following equation, which is built into Table 11.

$$Downstream\ Concentration = \frac{P_C * P_f + R_c * R_f}{P_f + R_f}$$

Where:

P_c = Maximum plume concentration in µg/L

P_f = Plume discharge in liters per day

R_c = Natural Mississippi River background concentration in µg/L

R_f = low flow 7Q10 of the Mississippi River in liters per day

Plume discharge in liters per day is calculated using the following equation:

$$Plume\ Discharge = h * w * v * 28.3$$

Where:

h = Vertical plume thickness in feet

w = Horizontal plume width in feet

v = Groundwater velocity in feet per day

The highest downstream concentration of each of the compounds that exceeded the Tier 1 screening value was calculated and compared to the MPCA Class 2B surface water criteria. Results are shown in the inset table below.

Compound	Potential Downstream Contribution from Area C (ug/L)	MPCA Class 2B Chronic Surface Water Standard or Screening Value (ug/L)
Barium	0.061	700
Cobalt	0.003	5
Iron	2.278	600
Manganese	0.709	800

Mercury (total)	0.00007	0.0069
Thallium	0.002	0.56
Vanadium	0.0002	132
Cyanide	0.004	5.2

After entering the surface water and mixing with the baseflow of the river, each of the compounds detected at Area C are well below the applicable surface water criteria and screening values. Therefore, based on the current and highest historical groundwater concentrations present at the monitoring locations immediately upgradient of the discharge point to the Mississippi River, discharge of groundwater to surface water is a completed exposure pathway that does not appear to present an unacceptable risk.

10 CONCLUSIONS

Historical groundwater, surface water and soil analytical data was supplemented with additional data for industrial waste, fill soil, native sand, surficial soil and groundwater and used to evaluate the environmental conditions present at Area C. Specifically, the data was used to delineate the extent of and to characterize the industrial waste, and to evaluate potential exposure pathways. With those objectives in mind, the following conclusions can be made.

- The ten soil borings completed on top of the paved portion of Area C and the five test trenches completed near the toe of the southern slope are sufficient to delineate the approximate extent of the industrial waste. The identified extent of waste appears to generally match the outline shown in the 1982 Twin Cities Assembly Facility Groundwater Monitoring Wells Survey (Ford 1982).
- The 40 soil samples collected from the soil borings and the 20 samples collected from the test trenches are sufficient to characterize the variability of impacts present within the industrial waste, the overlying fill soil, and the underlying native sands.
- The potential exposure pathways to impacts associated with Area C included:
    - Direct contact with industrial waste: Paint sludge with concentrations above industrial SRVs was identified within the accessible zone in Trenches 1, 2 and 3 at depths as shallow as 2.5 feet bgs, but the majority of the industrial waste appears to be covered by soil and construction debris placed after the industrial waste. The presence of industrial waste with contaminant concentrations exceeding industrial SRVs that is present within the accessible zone of zero to four feet bgs represents a completed exposure pathway with an unacceptable level of long-term risk.
    - Direct contact with surficial soil fill: Current land use does not allow exposure to surficial soil via direct contact, however, this exposure pathway could be complete in the case of trespassers. Results of surficial soil sampling completed on the slopes of Area C detected concentrations of BaP equivalents at three locations and DRO at 8 locations that exceeded their respective screening standards. The presence of surficial soil with contaminant concentrations exceeding industrial SRVs represents a completed exposure pathway with an unacceptable level of long-term risk. Additionally, there is construction debris including concrete and chunks of metal at the surface of Area C that present a potential physical hazard to trespassers in the area.
    - Ingestion of groundwater: This exposure pathway is not considered complete because Site groundwater is not currently used as a drinking water source, and it is highly unlikely to be used as a source in the future. Also, as documented in the Phase I ESA by Arcadis (Arcadis 2007a), no public water supply wells were observed within a one-mile radius of the Site.
    - Discharge of groundwater to surface water: Groundwater results from around Area C detected SVOCs, metals and cyanide at concentrations that sporadically exceed applicable surface water standards. Based on those results, the exposure pathway of discharge of groundwater to surface water is complete. An evaluation of the discharge of groundwater to surface water was completed in accordance with the *MPCA Surface Water Pathway Evaluation User's Guide.* Results of that evaluation did not identify any unacceptable risk to surface water based on the groundwater data collected at Area C to date.

- Erosion of surficial soil to surface water: One of the surface soil samples collected from below the 100-year flood level detected two compounds (DRO and BaP equivalents) at concentrations greater than what was typical of all surface soil samples. There are not surface water standards for DRO or BaP equivalents so this is considered a potentially complete exposure pathway with no unacceptable level of long-term risk.
- Inhalation of Soil Vapor: There are no permanent buildings designed for occupancy within 100 feet of Area C, therefore vapor intrusion is not a completed exposure pathway. However, if development scenarios for the Site include the presence of a building designed for occupancy within 100 feet of impacted soil or groundwater, then evaluation of this pathway and potential risk of inhalation exposure would be required.

11 RECOMMENDATIONS

Investigation of the distribution and characteristics of the industrial waste present at Area C is considered complete. A Feasibility Study will be completed to evaluate remedial options for Area C and for addressing the potential exposure pathways for industrial waste and surficial soil discussed above.

HNO3 = nitric acid
L = liter
mL = milliliter
MeOH = methanol
NaOH = sodium hydroxide
oz. = ounces
RCRA = Resource Conservation and Recovery Act
SVOC = semivolatile organic compound
TAL = Target Analyte List
TLCP = toxicity characteristic leaching procedure
VOAs = volatile organic analysis (container)
VOC = volatile organic compound
USEPA = United States Environmental Protection Agency
WI = Wisconsin

Table 2
Permanent Monitoring Well Construction Summary
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

Well ID	Unique Well Number	Date Installed	Surface Elevation (ft amsl)	Top Of Casing Elevation (ft amsl)	Bottom of Well Elevation (ft amsl)	Screen Interval (Elev. - Elev.) (ft amsl)	Top of Screen (ft bgs)	Bottom of Screen (ft bgs)	Well Diameter (inches)	Slot Size (inches)	Well Construction Materials (screen/riser)	Surface Completion Type	Screened Geology	Date Last Surveyed (Sunde Land Surveyors, LLC)

Acronyms and Abbreviations:
AMW = Arcadis monitoring well
Elev. = elevation
ft amsl = feet above mean sea level
ft bgs = feet below ground surface
MW = monitoring well
PVC = polyvinyl chloride

Notes and Abbreviations
on Page 3.

Table 3
Summary of Permanent Monitoring Well Groundwater Elevations
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

General Notes:
All monitoring wells were surveyed by Sunde Land Surveying, LLC. Refer to Table 2 for dates surveyed.
** Well not gauged due to restricted access.
Footnotes:
1. Data acquired from the National Oceanic and Atmospheric Administration databased (http://water.weather.gov/ahps2/hydrograph.php?wfo=mpx&gage=STPM5).
Acronyms and Abbreviations:
amsl = above mean sea level.
AMW = Arcadis Monitoring Well
btoc = below top of casing
ft = feet
GWE = Groundwater Elevation
NA = not applicable
NR = not recorded

Table 4
Summary of Current Soil Analytical and Field Screening Results
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

General Notes:

*	= criteria for total xylenes used, reported data is for the sum of the "m- and p-xylenes" and "o-xylenes" data results
**	= values for gasoline- and diesel-range organics are guidance values provided by the Petroleum Brownfields Program
Shade	Result value is above the MPCA Tier I Residential SRV
Shade	Result value is above the MPCA Tier II Industrial SRV

Italics = Result is above the MPCA SLV
< = not detected above reporting detection limit

Acronyms and Abbreviatiosn:

ASB = Arcadis soil boring
HA = hand auger
J = estimated result
mg/kg = milligrams per kilogram
MPCA = Minnesota Pollution Control Agency
NA = not analyzed
ND = not detected
NS = no standard
PCB = polychlorinated biphenyl
SLV = soil leaching value
SRV = soil reference value
SVOC = semi-volatile organic compound
TPH = total petroleum hydrocarbon
VOC = volatile organic compound

Table 5
Summary of Historical Detected Constituents in Soil Samples
Ford Motor Company - Twin Cities Assembly Plant

Reactive sulfide	mg/kg	NA	ND	mg/kg	NA	NA	61
pH	SU	NA	7.6	SU	NA	NA	7.9

Acronyms and Abbreviations:
° F = degrees Fahrenheit
EP = extraction procedure
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
NA = not analyzed
ND = not detected at or above method detection limit
NS = no standard
SRV = Soil Reference Value
SU = standard units
TCLP = Toxicity Characteristics Leaching Procedure
VOCs = volatile organic compounds

Footnotes:
* Indicates the SRV value for Total Xylenes used. No individual criteria for m-xylenes or o&p-xylenes.
1. TP-3 sample analyzed using TCLP.
2. TP-8 sample was analyzed using EP Toxicity Leachate Procedure for metals and Method 8260 for Total VOCs.

Table 6
Summary of TCLP Soil Analytical Results
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

General Notes:

Shade Value is above the USEPA TCLP Guidance criteria

Acronyms and Abbreviatiosn:

< = not deteced above reporting detection limit
ASB = Arcadis soil boring
J = estimated result
mg/l = milligrams per liter
MPCA = Minnesota Pollution Control Agency
NA = not analyzed
NS = no standard
SVOCs = semi-volatile compounds
TCLP = toxicity characteristic leaching procedure
U = analyzed but not detected
USEPA = United States Environmental Protection Agency
VOCs = volatile organic compounds

Table 7
Summary of Groundwater Analytical Results
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

General Notes:
Results are reported in micrograms per liter (µg/l).
Results for St. Peter Sandstone and Area C overburden permanent wells are compared to MPCA Class 2B Surface Water criteria.
* = Criteria for Total Xylenes Used.
Footnotes:
1. See benzo(a)pyrene (BaP)-equivalents action levels.
2. Lead MDH health-based water guidance action level at tap.
Acronyms and Abbreviations:
Shade Value is above the MDH health-based water guidance or USEPA maximum contaminant level (MCL) (for arsenic)
Shade Value is above the MPCA Class 2B Surface Water criteria for St. Peter Sandstone and Area C overburden monitoring wells
< = not detected
AMW = Arcadis monitoring well
E = matrix interference
HBV = health-based value
HRL = health risk limit
J = estimated result
MDH = Minnesota Department of Health
MEK = methyl ethyl ketone
MPCA = Minnesota Pollution Control Agency
NA = not applicable/not analyzed
ND = not detected
NS = no standard
PCB = polychlorinated biphenyl
PBP = Petroleum Brownfields Program
R = rejected result
RAA = risk assessment advice
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon
USEPA = United States Environmental Protection Agency
VOC = volatile compound

Table 8
Summary of Detected Constituents in Surface Water Samples
Ford Motor Company - Twin Cities Assembly Plant
966 South Mississippi River Boulevard
St. Paul, Minnesota

Acronyms and Abbreviations:

* = Standards vary with Total Hardness (TH). A hardness value of 180 mg/l was used to be conservative in calculating these values using MPCA published equations.

< + not detected

Shade Value is above the MPCA Class 2B Surface Water criteria

CS = chronic standard

Downstream = no map or description of location provided in historical reports

FAV = final acute value

J = estimated result

mg/L = milligrams per liter

MS = maximum standard

NR = not reported

NA= not analyzed

ND = not detected

NS = no standard

Outfall-01 = south of railroad access on south side of property, along the inside curve of Mississippi River Boulevard in Hidden Falls Park

R1 = Mississippi River upstream of Ford Power Plant

R2 = Mississippi River near southern property boundary

R3 = Mississippi River in park approximately 200 yds South of Ford property

SVOCs = semi-volatile organic compounds

SW-01 = upgradient of lock and dam approximately 270 feet

SW-02 = location shown on Figure 2

SW-03 = location shown on Figure 2

SW-04 = downgradient of southern boundary with Hidden Falls Park approximately 1600 feet

µg/L = micrograms per liter

Upstream = no map or description of location provided in historical reports

VOCs = volatile organic compounds

- Mississippi River/Retention Pond
- Elevation Contours (Feet Mean Sea Level)

Location ID (Boring)	
Sample Date	
Boring Depth Interval (ft bgs)	
Constituent	Result

NOTES:
1) mg/kg = milligrams per kilogram
2) mg/l = milligrams per liter
3) ft bgs = feet below ground surface
4) < = not detected above reporting detection limit
5) J = estimated result
6) NA = not applicable/not analyzed
7) ND = not detected
8) NS = no standard
9) PCB = polychlorinated biphenyl
10) SRV = soil reference value
11) SVOC = semivolatile organic compound
12) TCLP = toxicity characteristic leaching procedure
13) TPH = total petroleum hydrocarbons
14) USEPA = United States Environmental Protection Agency
15) VOC = volatile organic compound
16) Sample intervals that are underlined and italicized indicate collected within the industrial waste fill
17) Topographic survey for Area C completed January 2012, Sunde Land Surveying

Historical Documentation and Reports

AL JOHNSON CONSTRUCTION CO.
General Contractors
1700 NORTHWESTERN FINANCIAL CENTER
MINNEAPOLIS, MINNESOTA 55431
Telephone : 612/831-8151

October 26, 1979

Mr. Dan Greenwald
Manufacturing Engineering Manager
Ford Motor Company Twin Cities Assembly Plant
966 South Mississippi River Blvd.
St. Paul, Minnesota 55116

Dear Mr. Greenwald:

Thank you for meeting with me on, 22 October 1979, to discuss the possibility of our disposing of waste material in the area south of your steam plant. The material would consist of broken concrete, sandstone, and possibly some clean sand which would be obtained from the Ford Lock site where we have the contract for the rehabilitation of the lock.

The total quantity of concrete and sandstone that we are proposing to dispose of on your property is 29,000 cu. yd. with the possibility of an additional 18,000 cu. yd. of sand if we cannot find another use for the sand. The estimated quantities and periods of disposal are as follows:

1,000 c.y. of Concrete	November 1979
9,000 c.y. of Concrete	December 1979
9,000 c.y. of Concrete	December 1980
10,000 c.y. of Sandstone	December 1980
18,000 c.y. of Sand	April - May 1981

Attached is a drawing of the proposed fill area. The area shown to be filled is what we thought would be the best use of the waste material in developing the area as a possible storage site for your trucks. We would be willing to fill the area in any other way you wished. We would propose to bury the existing trees in the fill. Sand would be placed on top of the fill to give a smooth surface on which you could build your parking area. In addition, we would offer to pay the Ford Motor Company $.25 for every cubic yard of material actually wasted in the proposed area.

With the time being very short on our need for a disposal site in 1979, we would appreciate your early consideration in this matter. Again, thank you for your time and effort.

Very truly yours,

AL JOHNSON CONSTRUCTION CO.

I. INTRODUCTION

As part of an investigation into potential groundwater contamination resulting from an old inactive disposal site at the Twin Cities Assembly Plant, the Minnesota Pollution Control Agency (MPCA) requested Ford Motor Company to install four (4) groundwater monitoring wells in the vicinity of the inactive site. Prior to installing the wells a hydrogeologic survey was conducted by Soil Testing Services of Minnesota, Inc. Based on the information contained in the survey, the well locations were selected and submitted to the MPCA. Following their approval Soil Testing Services installed the wells.

On March 3, 1982 representatives from Ford's Stationary Source Environmental Control Office (SSECO) conducted a sampling program of the groundwater in the wells. Mr. Douglas Day of the MPCA was present during the sampling to review the procedures used and to obtain split samples. The parameters selected for analysis were based on a joint agreement between Ford and the MPCA and included:

- USEPA volatile priority pollutants
- Xylenes
- Methylethylketone
- Methylisobutylketone
- pH
- Specific conductivity
- Dissolved heavy metals (Cd,Cr,Pb,Cu,Ni,Zn)

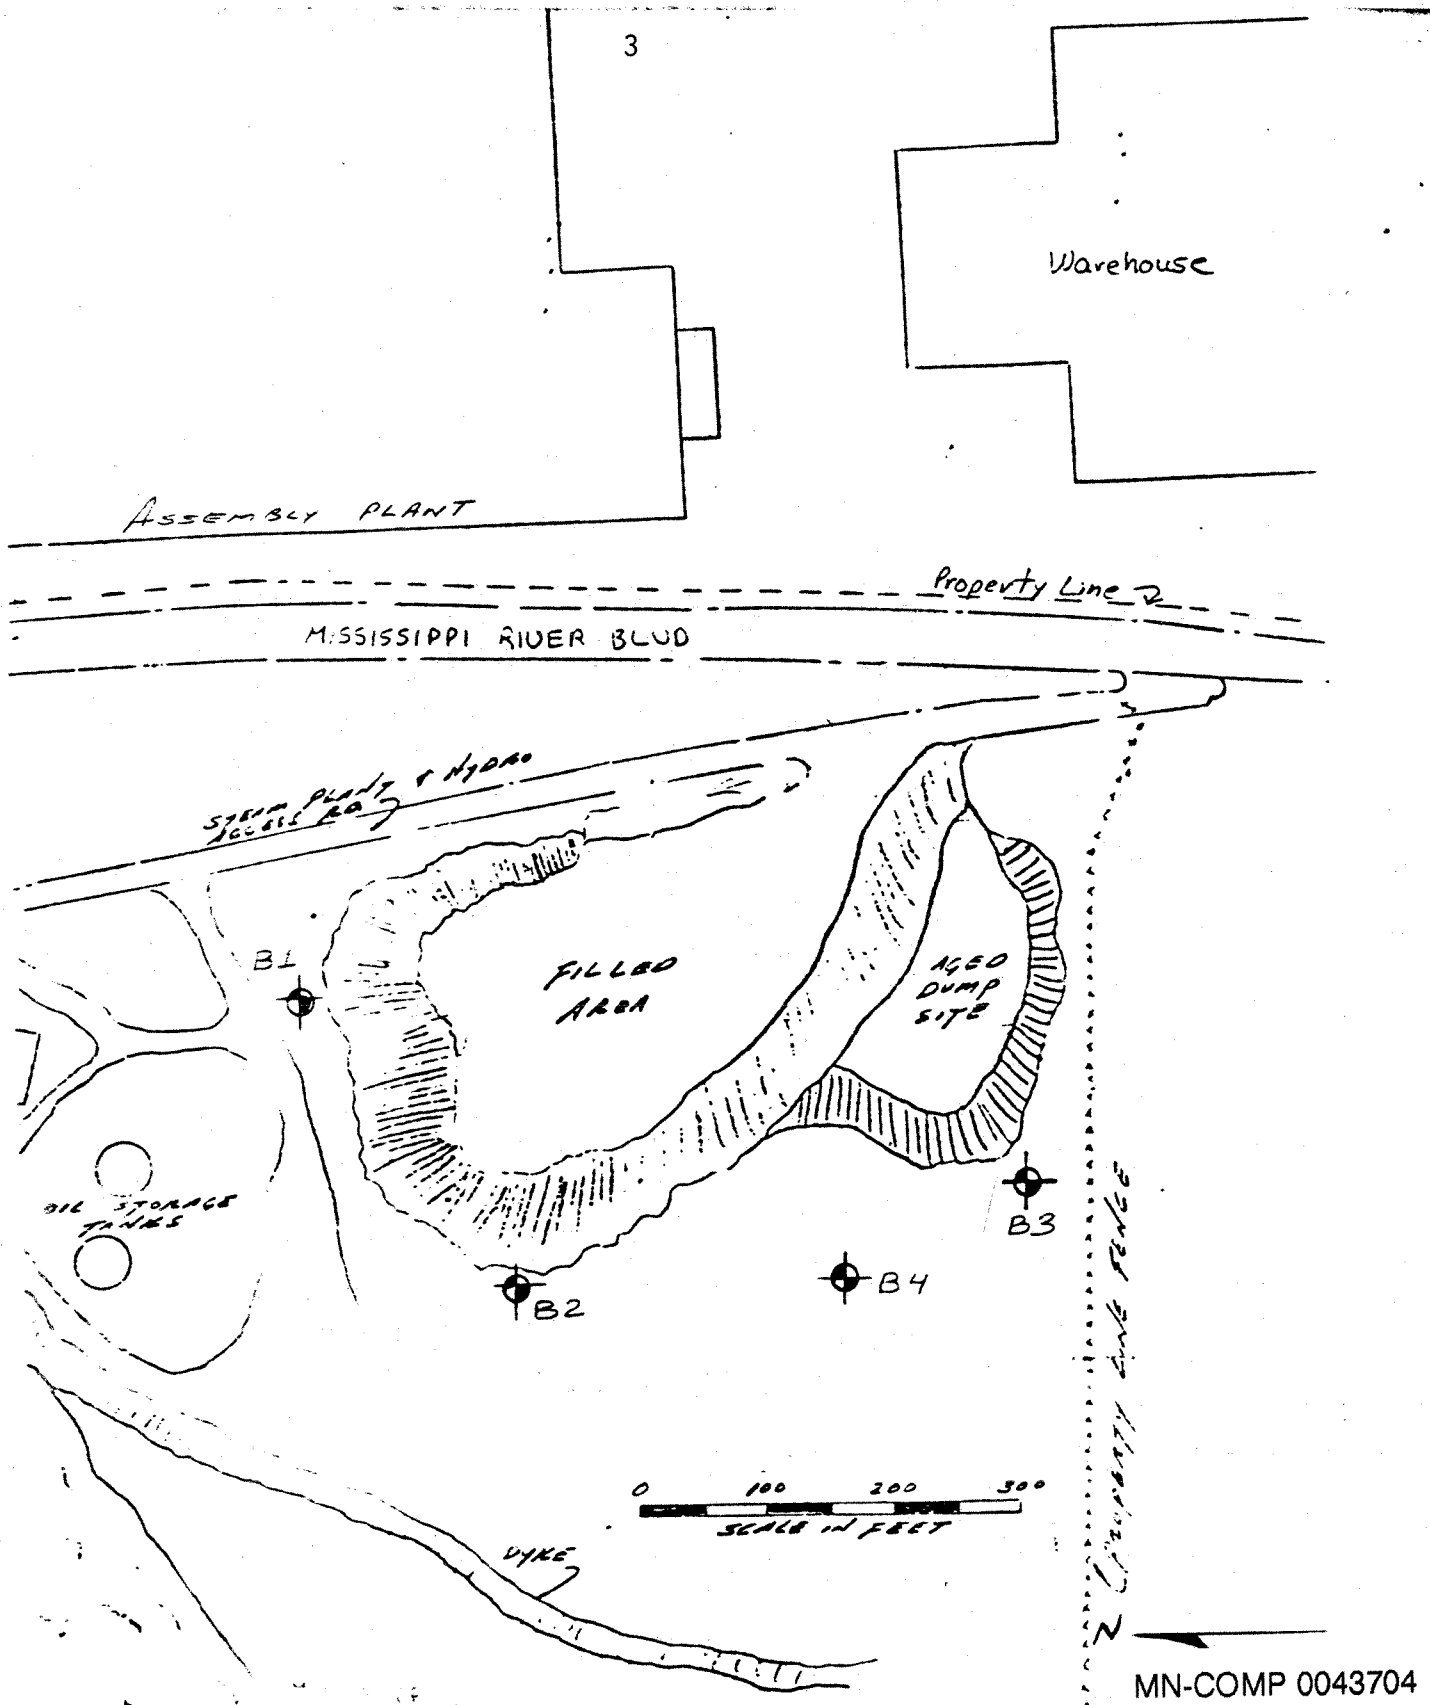
MN-COMP 0043702

II. SITE DESCRIPTION AND WELL LOCATIONS

The inactive disposal site is approximately 4 acres in size and is located west of the main assembly plant building between Mississippi River Boulevard and the Mississippi River. The site was used by the plant to dispose of construction rubble, paint sludges and old paints and solvents. It has not been used since 1965. The attached Figure 1 shows the location of the site and the approximate location of the 4 groundwater monitoring wells installed. The final locations of the wells were dictated somewhat by access to the rather rugged terrain found in the disposal site area, and the presence of underlying bedrock in certain locations which prohibited sampling the uppermost groundwater, directly connecting the Mississippi River.

Installation of the wells was completed in December of 1981. The well casings are 2" schedule 80 PVC pipe with the lower 10' of casing slotted and wrapped with Miarafi 140S fabric. The Miarafi acts as a filter to limit the amount of sediment entering the wells. Detailed information on the procedures used for installing the wells and the well boring logs can be obtained from the final report of Soil Testing Services of Minnesota dated February 26, 1982. The specifics of each are listed below:

MN-COMP 0043703



MN-COMP 0043704

FIGURE 1
TWIN CITIES ASSEMBLY
SITE AND WELL LOCATION

Well No.	Bottom of Casing Elevation (Ft.)	Casing Length from Grade (Ft.)
B-1	678.52	51.0
B-2	671.27	44.5
B-3	672.49	24.5
B-4	675.97	29.5

On the basis of the preliminary measurements obtained by Soil Testing Services following completion of the wells, the groundwater movement in the area is to the west northwest, toward the Mississippi River. On this basis, Well No. B-1 is anticipated to be an upgradient well, or at least unaffected by the disposal site, while Wells B-2, B-3, and B-4 are downgradient of the site.

III. SUMMARY

A summary of the results from the well samplings appears in Table 1. On the basis of static water level measurements, Well B-1 can be considered the upgradient or unaffected by the disposal site and Wells B-2, B-3 and B-4 downgradient of the disposal site.

As indicated by the data, metal concentrations in the groundwater from the downgradient wells are consistently low. Only trace levels of three organic compounds were detected in three of the wells; two of which were present in the upgradient well. These findings indicate no apparent contamination due to the inactive disposal site.

MN-COMP 0043706

Table 1

Twin Cities Assembly Plant
Groundwater Analysis Summary

		Well No.			
Dissolved Metals	Units	B1	B2	B3	B4
Copper	mg/l	0.03	0.02	0.01	0.01
Cadmium	mg/l	0.02	<0.01	<0.01	0.02
Zinc	mg/l	0.06	0.04	<0.02	0.09
Nickel	mg/l	0.07	0.04	0.02	0.05
Chromium	mg/l	<0.05	<0.05	<0.05	<0.05
Lead	mg/l	0.12	<0.05	<0.05	0.06
pH	Units	7.08	7.01	7.07	6.84
Specific Conductivity	Umhos/cm	985	1064	1666	1482
Temperature	^{o}F.	47	45	45	46
Organics

Trichloroethylene	µg/l	4	5	<2	<2
Toluene	µg/l	1	1	<1	1

MN-COMP 0043707

IV. RESULTS

Static water level measurements obtained prior to well clearing and sampling are tabulated below, together with measurements made by Soil Testing Services on January 5, 1982 following the well installations and developments:

Table 2

Groundwater Level Data

Well No.	Static Water Levels 1/5/82	3/3/82
B-1	688.62	688.35
B-2	688.11	687.71
B-3	688.65	688.27
B-4	688.53	688.05

The March data agrees fairly well with the previous data and tends to confirm the west to northwest groundwater movement. On this basis, Well B-1 is upgradient of the disposal site and the remaining three wells are downgradient.

The results of the dissolved metals analyses appear in Table 3. The final value represents the average of 7 consecutive readings made on each sample.

Table 4 contains the results of analyses for the volatile organic materials. Duplicate analysis showed excellent agreement; both field and well casing material blanks were satisfactory.

Specifications regarding the exact method of analysis with respect to metals and organics can be found in Appendix C together with the detection levels associated with each procedure.

MN-COMP 0043708

Table 3
Twin Cities Assembly Plant
Groundwater Monitoring Results
Dissolved Metals
March 3, 1982

	B1	B2	B3	B4
Lead	0.12	<.05	<.05	0.06
Chromium	<.05	<.05	<.05	<.05
Nickel	0.07	0.04	0.03	0.05
Zinc	0.06	0.04	<.02	0.09
Cadmium	0.02	<.01	<.01	0.02
Copper	0.03	0.02	0.01	0.01

All values are the average of seven measurements of the same sample. Units are mg/l.

TABLE 4
Twin Cities Assembly Plant
Groundwater Monitoring Results
Volatile Organics
March 3, 1982

	B1	B1 (Dup)	B2	B2 (Dup)	B3	B3 (Dup)	B4	B4 (Dup)
1,2 Dichloroethylene	-	-	13	17	-	-	-	-
Trichloroethylene	4	3	5	5	-	-	-	-
Toluene	1	2	1	1	-	-	1	1

Duplicate field blanks showed no detectable levels of volatile organics.

Well casing blanks showed 4 PPB Toluene and 6 PPB methylene chloride, however these are attributed to the laboratory atmosphere.

Only detectable quantities are reported.

MN-COMP 0043710

APPENDIX A

SAMPLING PROCEDURES

MN-COMP 0043711

APPENDIX A

SAMPLING PROCEDURES

Prior to sampling, static water level determinations were made. Based on the static and the measured depth of each well, the volumes of water in each well casing calculated. Each well was then cleared to remove three times the calculated water volume. Wells B-1 and B-2 were cleared by manual methods utilizing a stainless steel bailer. Wells B-3 and B-4 were not as deep and therefore could be cleared with a peristalic pump and tygon tubing suction line. Once clearing was completed, the static water level was again determined and the samples were withdrawn from the wells with a stainless steel bailer. Table 5 represents some of the pertinent well data as it relates to the monitoring survey.

In order to avoid either cross contamination or contamination from extraneous sources, the stainless steel bailer and attached stainless cable were subjected to a thorough cleaning before being immersed in a well. The bailer and cable were first rinsed with organic free water followed by a methanol rinse and finally a second rinse with organic free water.

The wells were sampled in the following order: Wells B-1, B-2, B-4, and B-3. Well B-1 was sampled first since it was considered the upgradient well. Water level recovery was rapid, therefore samples were collected immediately after well evacuation. Samples for volatile priority pollutants plus xylenes, methylethyl ketone, and methylisobutyl ketone were

MN-COMP 0043713

collected by transferring some of the sample from the bailer to a cleaned glass beaker, and subsequently filling individual volatile organic sampling vials. Care was taken to avoid both unnecessary agitation of the sample and air bubbles trapped in the sealed vial. Volatile samples were maintained at 4^{o} C until analysis. A second portion of the sample was filtered through a 0.45 micron filter on site and the filtrate acidified to pH 2. This sample was analyzed for dissolved metals. pH, conductivity and temperature determinations which were performed on site.

APPENDIX B

Analytical Procedures

MN-COMP 0043715

APPENDIX B

Analytical Procedures

Temperature and specific conductivity were determined on site using a Horiba Model U-7 water analyzer. pH was measured on site using an Extech Model 631 digital meter.

Metal determinations were made using an Instrument Laboratory IL 151 atomic absorption spectrometer and EPA methodology. The detection limits listed below were calculated by determining the standard deviation from a series of seven measurements of the lowest standard for each metal analyzed. The standard deviations were then multiplied by two which results in confidence limits of approximately 95%.

Metals Detection Limits (mg/l)	
Copper	0.01
Cadmium	0.01
Zinc	0.02
Nickel	0.03
Chromium	0.05
Lead	0.05

MN-COMP 0043716

Volatile organic concentrations were measured utilizing a Hewlett Packard HP 5992 GC/MS, incorporating a thirty meter, fused Silica, thick coat, DB-5 capillary column. The GC/MS was used in conjunction with an Envirochem Unicon purge and trap device and a Hewlett Packard dual floppy disc data storage system. The detection limits listed below were determined by the lower peak area threshold limit, which is set by the analytical program used.

Priority Pollutant VOA Compound	Detection Limit(ppb)	Priority Pollutant VOA Compound	Detection Limit(ppb)

Subject: Twin Cities Assembly Plant
Waste Disposal Site--Groundwater Investigation

Dear Mr. Day:

Attached for your review is our final report covering the groundwater and Mississippi River samplings performed December 1, 1982 in the vicinity of the inactive waste disposal site at the Twin Cities Assembly Plant.

The results of groundwater elevation measurements confirm our earlier contention of a westerly groundwater flow to the Mississippi River. Accordingly, both Wells B1 and B5 can be considered upgradient wells, unaffected by the disposal site. The similarity of groundwater elevation with the Mississippi River also confirms a hydraulic connection between the two. Thus any contribution of the disposal site would undoubtedly flow into the River.

Dissolved metals in both the groundwaters and River were well below U.S. EPA Interim Drinking Water Standards. Only trace levels of five organics were detected in the groundwaters, three of which were also detected in the River upstream of the disposal site. 1,2 Dichloroethylene was detected in downgradient wells B2 and B4 at concentrations of 21 ugm/l and 8 ugm/l respectively, however none was detected in any River water samples.

In their February 26, 1982 Hydrogeologic Engineering Evaluation, Soils Testing Services estimated the groundwater flow past the disposal site to be approximately 15,000 gallons per day. Recent groundwater elevational data supports the hydraulic gradient used in their estimate. On this basis, and an estimated River flow of 6.5×10^9 gallons per day at this location, a groundwater dilution factor of 4.3×10^5 would be achieved. Thus the trace levels of 1,2 dichloroethylene detected could not present a problem to any potential user.

These findings, establish that the disposal site is not adversely affecting any water supplies and no further investigations of this site is warranted.

Very truly yours,

J.M. Reinke, Manager

I. Introduction

As part of a continuing investigation into potential groundwater contamination resulting from an old inactive disposal site at the Twin Cities Plant, the Minnesota Pollution Control Agency (MPCA) requested Ford Motor Company to install an additional groundwater well (B5) to be monitored in conjunction with the four wells currently in place. The additional well location was approved by the MPCA prior to installation. In addition, samples and elevation data of the Mississippi River were also obtained for informational purposes.

On December 1, 1982 representatives from Ford's Stationary Source Environmental Control Office (SSECO) conducted a sampling program of the groundwater in the wells. Mr. Douglas Day of the MPCA was present during the sampling to review the procedures used and to obtain split samples. As in the first survey on March 3, 1982, the parameters selected for analysis were based on a joint agreement between Ford and the MPCA and included:

- USEPA volatile priority pollutants
- Xylenes
- Methylethylketone
- Methylisobutylketone
- pH
- Specific conductivity
- Dissolved heavy metals (Cd,Cr,Pb,Cn,Ni,Zn)

MN-COMP 0043741

II. Site Description and Well Locations

The disposal site was used by the plant to dispose of construction rubble, paint sludges and old paints and solvents. It has not been used since 1965. For a thorough description of the plant site, refer to the report dated March 3, 1982.

Figure 1 shows the location of the original 4 monitoring wells and the location of the recently installed 5th well. Well B5 was installed on November 30, 1982. The well casing is 2" schedule 80 PVC pipe with the lower 10' of casing slotted and wrapped with Miarafi 140S fabric. Detailed information on the procedures used for installing the well and the well boring log can be obtained from the report of Soil Testing Services of Minnesota dated December 14, 1982 contained in Appendix D.

FIGURE 1
TWIN CITIES ASSEMBLY PLANT
SITE AND WELL LOCATION

III. Summary

A summary of the results from the well and river sampling appears in Table I. On the basis of static water level measurements, Wells B1 and B5 should be considered upgradient wells. These wells appear to be unaffected by the disposal site while Wells B2, B3 and B4 are downgradient of the disposal site.

As indicated by the data, metals concentrations in the groundwater from the wells and the samples from the river are consistently low, significantly below USEPA Interim Drinking Water Standards. Only trace levels of five volatile organic compounds were detected in the wells, three of which were also detected in the river both upstream and downstream of the site.

IV. Results

At the time of Well B5 installation, the PVC casings of all wells were resurveyed by Soil Testing Services. This information was used to determine if any settling of well casings had occurred. The survey was completed on December 1, 1982. Static head measurements taken on December 1, in conjunction with updated well elevations, now provide a clearer picture of groundwater flow direction. Listed below are both the new and original casing elevations.

Table 2

Well Casing Elevations

	January 1982	December 1982
Well B1	730.52	730.49
B2	718.96	718.75
B3	704.85	704.67
B4	708.63	708.48
B5		703.81
*BM-1		691.75
*BM-2		691.81
*Lath		698.57

*BM-1 In river approximately 20' from southern fence line.
*BM-2 In river approximately 50' north of BM-1.
*Lath On river bank near BM-2.

Additionally, three locations were established in and along the river to monitor river elevations. STS installed a lath on the river bank and two metal benchmark stakes in the river. The site plan in the attached STS report illustrates the location of the new benchmarks.

MN-COMP 0043745

IV. Results (Cont.)

Listed below are the static water levels as measured on December 1, 1982.

Table 3

Groundwater Level Data

Well No.	Static Water Levels 12/1/82
B1	691.85
B2	691.13
B3	691.42
B4	691.58
B5	691.96
River	
BM-1	691.42

Based on the groundwater elevations, the flow appears to be moving westerly toward the river as illustrated in Figure 2. This direction supports our original contention that Well B1 is an upgradient well and, in addition, confirms that Well B5 is likewise an upgradient well.

The river elevation was determined at 9:00 am on December 1, (691.21) and at 2:15 pm (691.42). Although the elevation increased by .21 the water level in Well B4 showed no appreciable change. There may be a delay, however, associated with correlating river and well elevations which could not be determined during this survey.

On December 1, 1982 SSECO collected samples of Mississippi River water in order to analytically compare river water to well water. Samples were collected upstream of the Ford powerplant and downstream near the southern boundary of Ford property and approximately 200 yards

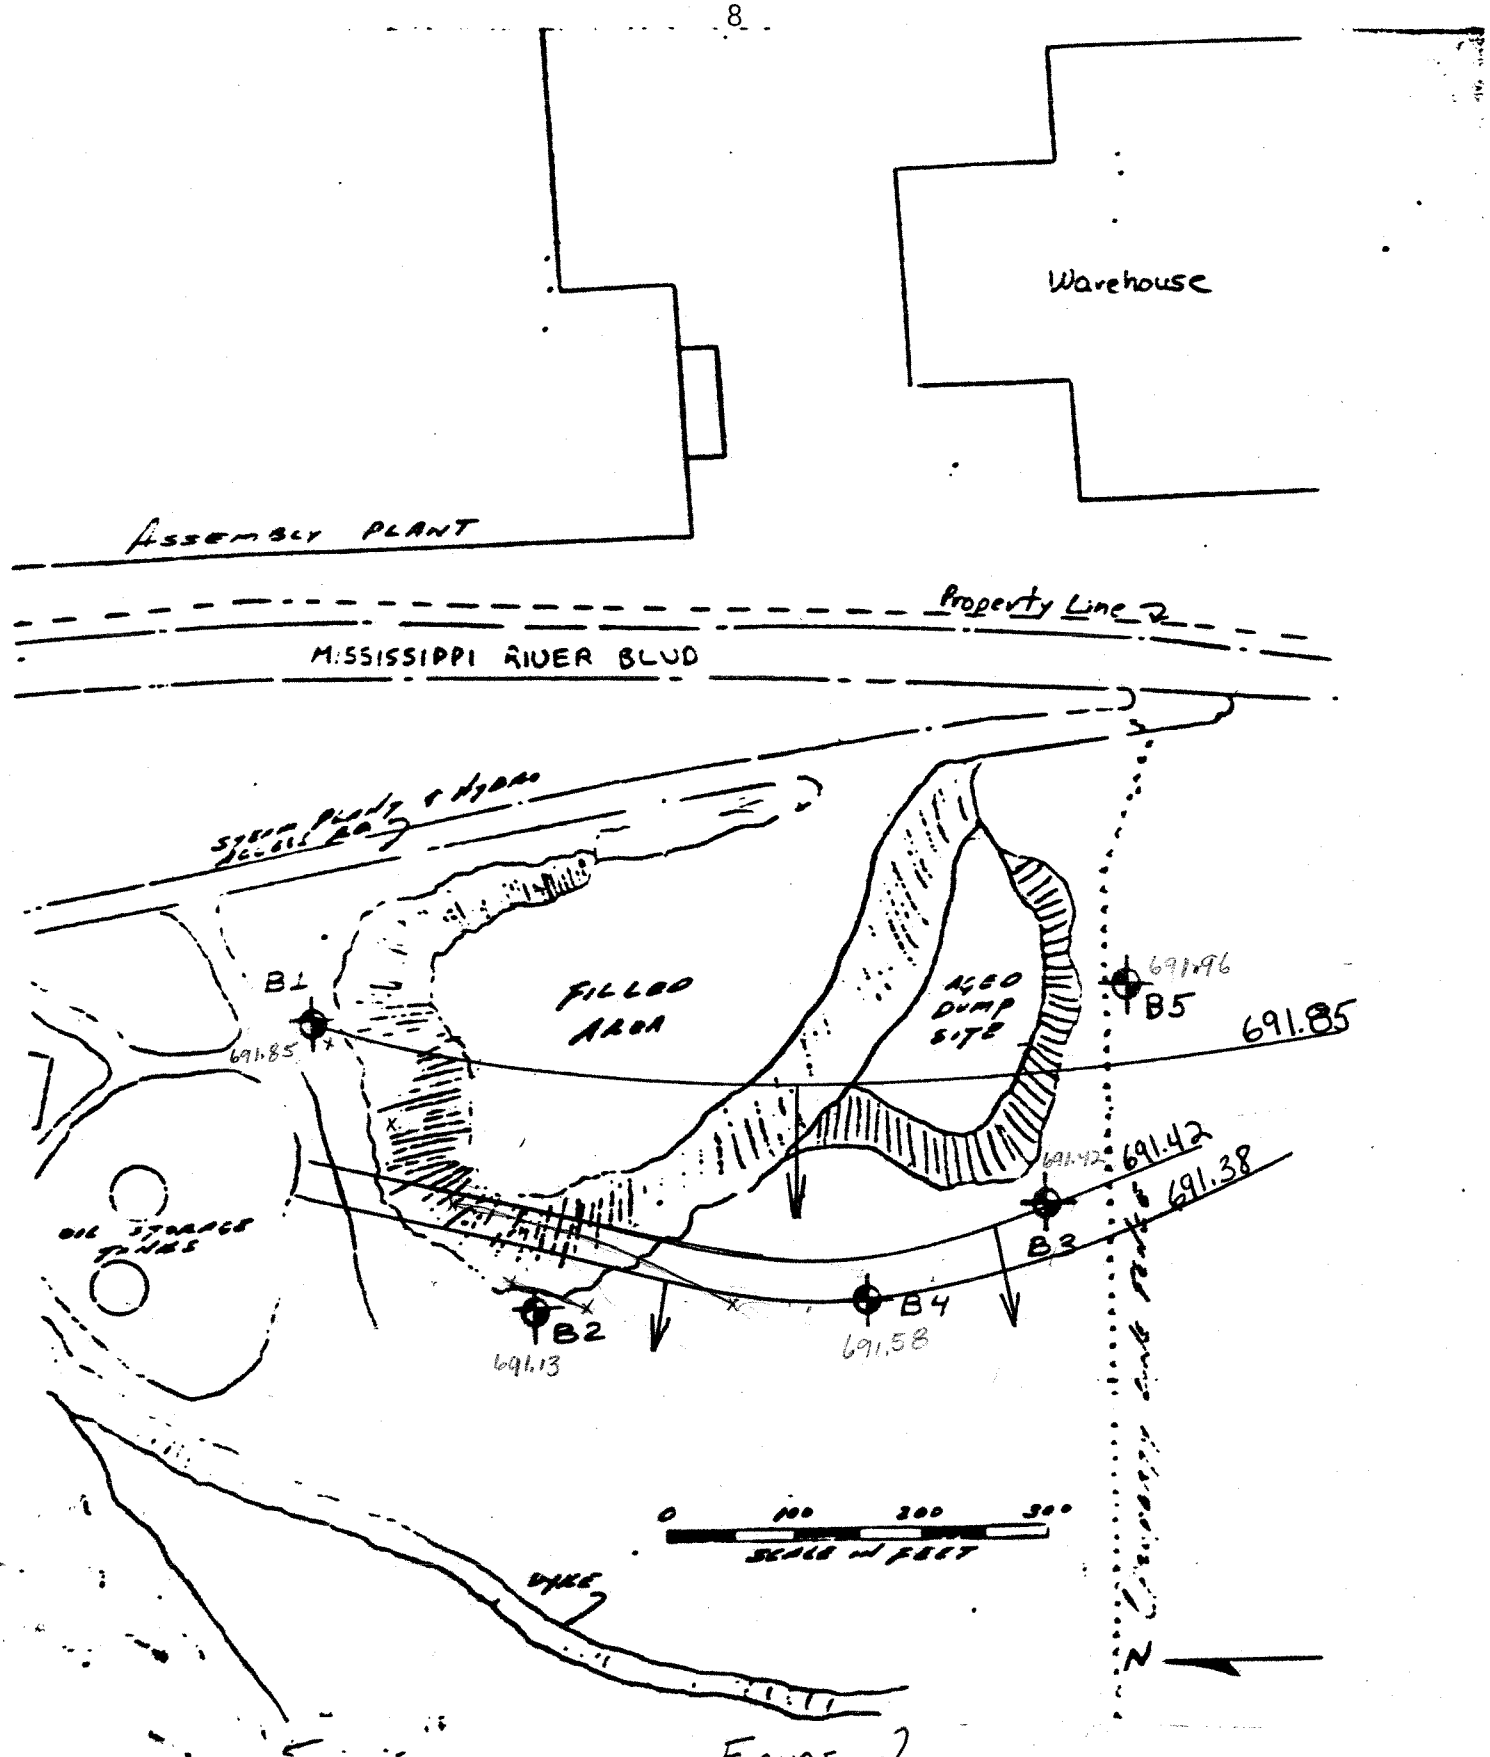

FIGURE 2

IV. Results (Cont.)

south of the property, in the park. The results are shown in Table 4. Only trace levels of these organics were detected. Dissolved metals were all below detectable levels.

Specifications regarding the exact method of analysis with respect to metals and organics can be found in Appendix B together with the detection levels associated with each procedure.

The results of the dissolved metals analyses appear in Table 5 .

Table 6 contains the results of analyses for the volatile organic compounds. As indicated, the samples were run in duplicate and the results show acceptable agreement.

Sampling Procedures

MN-COMP 0043752

Appendix A

Sampling Procedures

Prior to sampling, static water level determinations were made. Based on the static and the depth of each well, the volumes of water in each well casing was calculated. Each well was then cleared to remove three times the calculated water volume. Wells B1, B2 and B5 were cleared by manual methods utilizing a stainless steel bailer. Wells B3 and B4 were not as deep and therefore could be cleared with a peristalic pump and Tygon tubing suction line. Once clearing was completed, the static water level was again determined and the samples were withdrawn from the wells with a stainless steel bailer. Table 7 represents some of the pertinent well data as it relates to the monitoring survey.

In order to avoid either cross contamination or contamination from extraneous sources, the stainless steel bailer was subjected to a thorough cleaning before being immersed in a well. The bailer was first rinsed with organic free water followed by a methanol rinse and finally a second rinse with organic free water. Also, at each well a new section of braided nylon line was attached to the bailer for sampling purposes.

The wells were sampled in the following order: Wells B3, B4, B2, B1, and B5. Well B3 was sampled first since the first sampling indicated no detectable levels of trace organics. Samples for volatile priority pollutants plus xylenes, methylethyl ketone, and methylisobutyl ketone were collected by transferring some of the sample from the bailer to the individual volatile organic sampling vials. Care was taken to avoid

both unnecessary agitation of the sample and air bubbles trapped in the sealed vial. Volatile samples were maintained at $4^{o}C$. until analysis. A second portion of the sample was filtered through a 0.45 micron filter on site and the filtrate acidified to pH2. This sample was analyzed for dissolved metals. PH, conductivity and temperature determinations were performed on site.

MN-COMP 0043755

Appendix B

Analytical Procedures

Temperature, pH and specific conductivity were determined on site using a Horiba Model U-7 water analyzer. Metals determinations were made using an Instrument Laboratory (IL) 151 atomic absorption spectrometer. Additionally, a Model 453 IL graphite furnace was employed for the determination of lead. Listed below are the detection limits:

Metals Detection Limits (mg/l)

Copper	0.05
Lead	0.002
Cadmium	0.001
Zinc	0.05
Nickel	0.02
Chromium	0.05

The low detection limits for nickel and cadmium were achieved on the flame unit by concentrating the sample by a factor of 10.

MN-COMP 0043757

Appendix B (Cont.)

Volatile organic concentrations were measured utilizing a Hewlett Packard HP 5992 GC/MS, incorporating a thirty meter, fused Silica, thick coat, DB-5 capillary column. The GC/MS was used in conjunction with an Envirochem Unicon purge and trap device and a Hewlett Packard dual floppy disc data storage system. The detection limits listed below were determined by the lower peak area threshold limit, which is set by the analytical program used.

STS Job No. 92776-B

RE: Installation of Monitoring Well B-5A at the Twin Cities Assembly Plant's Steam Plant.

Dear Mr. Cloutier:

In accordance with your Purchase Order No. 763889 dated October 25, 1982, we have completed the soil boring and monitoring well installation at location B-5A. We have also resurveyed the top of the 2 inch ID Schedule 80 PVC monitoring wells at locations B-1, B-2, B-3 and B-4. In addition, we have established three vertical control points near the bank of the Mississippi River west of the disposal site.

Three copies of this letter have been sent to the above address and carbon copies have been sent to the personnel designated below. The letter is accompanied by the Log of Boring No. B-5A, the Monitoring Well Construction Diagram for location B-5A, a site plan showing the new well location and new vertical control points along the bank of the Mississippi River, and a summary of the elevation survey completed November 30, 1982.

If we can be of further assistance to you, please do not hesitate to contact us.

Yours very truly,

STS CONSULTANTS, LTD.

GENERAL NOTES

DRILLING & SAMPLING SYMBOLS:

SS	:	Split Spoon - 1 3/8" I.D., 2" O.D. Unless otherwise noted	OS	:	Osterberg Sampler - 3" Shelby Tube
ST	:	Shelby Tube - 2: O.D., Unless otherwise noted	HS	:	Hollow Stem Auger
PA	:	Power Auger	WS	:	Wash Sample
DB	:	Diamond Bit - NX, BX, AX	FT	:	Fish Tail
AS	:	Auger Sample	RB	:	Rock Bit
JS	:	Jar Sample	BS	:	Bulk Sample
VS	:	Vane Shear	PM	:	Pressuremeter Test, In-Situ
			GS	:	Giddings Sampler

Standard "N" Penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2 inch O.D. split spoon sampler, except where otherwise noted.

WATER LEVEL MEASUREMENT SYMBOLS:

WL	:	Water Level	WCI	:	Wet Cave In
WS	:	While Sampling	DCI	:	Dry Cave In
WD	:	While Drilling	BCR	:	Before Casing Removal
AB	:	After Boring	ACR	:	After Casing Removal

Water levels indicated on the boring logs are the levels measured in the boring at the times indicated. In pervious soils, the indicated elevations are considered reliable groundwater levels. In impervious soils, the accurate determination of ground water elevations may not be possible, even after several days of observations; additional evidence of ground water elevations must be sought.

GRADATION DESCRIPTION & TERMINOLOGY:

Coarse Grained or Granular Soils have more than 50% of their dry weight retained on a #200 sieve; they are described as: boulders, cobbles, gravel or sand. Fine Grained soils have less than 50% of their dry weight retained on a #200 sieve; they are described as: clays or clayey silts if they are cohesive and silts if they are non-cohesive. In addition to gradation, granular soils are defined on the basis of their relative in-place density and fine grained soils on the basis of their strength or consistency and their plasticity.

Major Component Of Sample	Size Range	Descriptive Term Of Components Also Present in Sample	Percent Of Dry Weight
Boulders	Over 8 in. (200 mm)	Trace	1 - 9
Cobbles	8 inches to 3 inches (200 mm to 75 mm)	Little	10 - 19
Gravel	3 inches to #4 sieve (75 mm to 4.76 mm)	Some	20 - 34
Sand	#4 to #200 sieve (4.76 mm to 0.074 mm)	And	35 - 50
Silt	Passing #200 sieve (0.074 mm to 0.005 mm)		
Clay	Smaller than 0.005 mm		

CONSISTENCY OF COHESIVE SOILS:

Unconfined Compressive Strength, Qu, tsf	Consistency
< 0.25	Very Soft
0.25 - 0.49	Soft
0.50 - 0.99	Medium (Firm)
1.00 - 1.99	Stiff
2.00 - 3.99	Very Stiff
4.00 - 8.00	Hard
> 8.00	Very Hard

RELATIVE DENSITY OF GRANULAR SOILS:

N - Blows per ft.	Relative Density
0 - 3	Very Loose
4 - 9	Loose
10 - 29	Medium Dense
30 - 49	Dense
50 - 80	Very Dense
80+	Extremely Dense

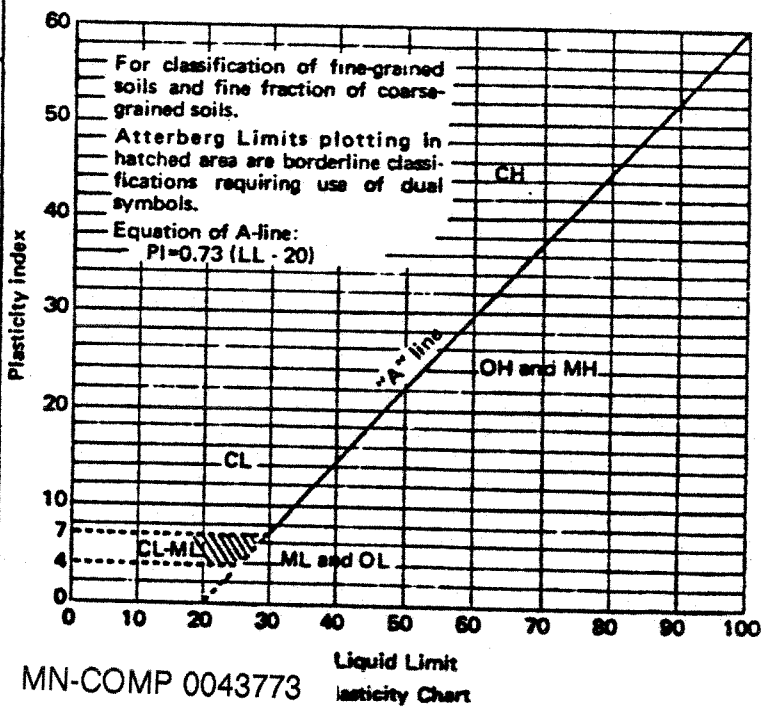
MN-COMP 0043772

UNIFIED SOIL CLASSIFICATION SYSTEM

Major divisions			Group symbols	Typical names	Laboratory classification criteria
Coarse-grained soils (More than half of material is *larger* than No. 200 sieve size)	Gravels (More than half of coarse fraction larger than No. 4 sieve size)	Clean gravels (Little or no fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3
			GP	Poorly graded gravels, gravel-sand mixtures, little or no fines	Not meeting all gradation requirements for GW
		Gravels with fines (Appreciable amount of fines)	GM d / u	Silty gravels, gravel-sand-silt mixtures	Atterberg limits below "A" line or P.I. less than 4 / Atterberg limits above "A" line with P.I. greater than 7 — Above "A" line with P.I. between 4 and 7 are *borderline* cases requiring use of dual symbols
			GC	Clayey gravels, gravel-sand-clay mixtures	
	Sands (More than half of coarse fraction is smaller than No. 4 sieve size)	Clean sands (Little or no fines)	SW	Well-graded sands, gravelly sands, little or no fines	$C_u = \frac{D_{60}}{D_{10}}$ greater than 6; $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3
			SP	Poorly graded sands, gravelly sands, little or no fines	Not meeting all gradation requirements for SW
		Sands with fines (Appreciable amount of fines)	SM d / u	Silty sands, sand-silt mixtures	Atterberg limits below "A" line or P.I. less than 4 / Atterberg limits above "A" line with P.I. greater than 7 — Limits plotting in hatched zone with P.I. between 4 and 7 are *borderline* cases requiring use of dual symbols.
			SC	Clayey sands, sand-clay mixtures	
Fine-grained soils (More than half of material is *smaller* than No. 200 sieve)	Silts and clays (Liquid limit less than 50)		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity	
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays	
			OL	Organic silts and organic silty clays of low plasticity	
	Silts and clays (Liquid limit greater than 50)		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts	
			CH	Inorganic clays of high plasticity, fat clays	
			OH	Organic clays of medium to high plasticity, organic silts	
Highly organic soils			Pt	Peat and other highly organic soils	

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

Less than 5 per cent	GW, GP, SW, SP
More than 12 per cent	GM, GC, SM, SC
5 to 12 per cent	*Borderline* cases requiring dual symbols



MN-COMP 0043773

AMERICAN SOCIETY FOR TESTING AND MATERIALS

1916 Race St., Philadelphia, Pa. 19103

Reprinted from Copyrighted 1968 Book of ASTM Standards, Part 11

Standard Method for

PENETRATION TEST AND SPLIT-BARREL SAMPLING OF SOILS[1]

ASTM Designation: D 1586 – 67

This Standard of the American Society for Testing and Materials is issued under the fixed designation D 1586; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval.

1. Scope

1.1 This method describes a procedure for using a split-barrel sampler to obtain representative samples of soil for identification purposes and other laboratory tests, and to obtain a measure of the resistance of the soil to penetration of the sampler.

2. Apparatus

2.1 *Drilling Equipment*—Any drilling equipment shall be acceptable that provides a reasonably clean hole before insertion of the sampler to ensure that the penetration test is performed on undisturbed soil, and that will permit the driving of the sampler to obtain the sample and penetration record in accordance with the procedure described in 3. Procedure. To avoid "whips" under the blows of the hammer, it is recommended that the drill rod have a stiffness equal to or greater than the A-rod. An "A" rod is a hollow drill rod or "steel" having an outside diameter of 1⅝ in. or 41.2 mm and an inside diameter of 1⅛ in. or 28.5 mm, through which the rotary motion of drilling is transferred from the drilling motor to the cutting bit. A stiffer drill rod is suggested for holes deeper than 50 ft (15 m). The hole shall be limited in diameter to between 2¼ and 6 in. (57.2 and 152 mm).[2]

2.2 *Split-Barrel Sampler*—The sampler shall be constructed with the dimensions indicated in Fig. 1. The drive shoe shall be of hardened steel and shall be replaced or repaired when it becomes dented or distorted. The coupling head shall have four ½-in. (12.7-mm) (minimum diameter) vent ports and shall contain a ball check valve. If sizes other than the 2-in. (50.8-mm) sampler are permitted, the size shall be conspicuously noted on all penetration records.

2.3 *Drive Weight Assembly*—The assembly shall consist of a 140-lb (63.5-kg) weight, a driving head, and a guide permitting a free fall of 30 in. (0.76 m). Special precautions shall be taken to ensure that the energy of the falling weight is not reduced by friction between the drive weight and the guides.

2.4 *Accessory Equipment* — Labels, data sheets, sample jars, paraffin, and other necessary supplies should accompany the sampling equipment.

3. Procedure

3.1 Clear out the hole to sampling elevation using equipment that will ensure that the material to be sampled is not disturbed by the operation. In saturated sands and silts withdraw the drill bit slowly to prevent loosening of the soil around the hole. Maintain the water level in the hole at or above ground water level.

3.2 In no case shall a bottom-discharge bit be permitted. (Side-discharge bits are permissible.) The process of jetting through an open-tube sampler and then sampling when the desired depth is reached shall not be permitted. Where casing is used, it may not be driven below sampling elevation. Record any loss of circulation or excess pressure in drilling fluid during advancing of holes.

3.3 With the sampler resting on the bottom of the hole, drive the sampler with blows from the 140-lb (63.5-kg) hammer falling 30 in. (0.76 m) until either 18 in. (0.45 m) have been penetrated or 100 blows have been applied.

3.4 Repeat this operation at intervals not longer than 5 ft (1.5 m) in homogeneous strata and at every change of strata.

3.5 Record the number of blows required to effect each 6 in. (0.15 m) of penetration or fractions thereof. The first 6 in. (0.15 m) is considered to be a seating drive. The number of blows required for the second and third 6 in. (0.15 m) of penetration added is termed the penetration resistance, *N*. If the sampler is driven less than 18 in. (0.45 m), the penetration resistance is that for the last 1 ft (0.30 m) of penetration (if less than 1 ft (0.30 m) is penetrated, the logs shall state the number of blows and the fraction of 1 ft (0.30 m) penetrated).

3.6 Bring the sampler to the surface and open. Describe carefully typical

[1] Under the standardization procedure of the Society, this method is under the jurisdiction of the ASTM Committee D-18 on Soil and Rock for Engineering Purposes. A list of members may be found in the ASTM Year Book.

Current edition accepted Oct. 20, 1967. Originally issued 1958. Replaces D 1586 – 64 T.

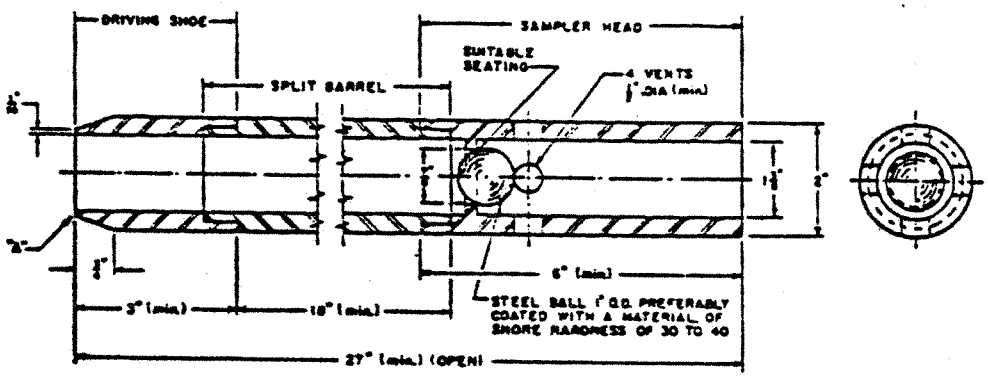
MN-COMP 0043774



NOTE 1—Split barrel may be 1½ in. inside diameter provided it contains a liner of 16-gage wall thickness.

NOTE 2—Core retainers in the driving shoe to prevent loss of sample are permitted.

NOTE 3—The corners at *A* may be slightly rounded.

samples of soils recovered as to composition, structure, consistency, color, and condition; then put into jars without ramming. Seal them with wax or hermetically seal to prevent evaporation of the soil moisture. Affix labels to the jar or make notations on the covers (or both) bearing job designation, boring number, sample number, depth penetration record, and length of recovery. Protect samples against extreme temperature changes.

4. Report

4.1 Data obtained in borings shall be recorded in the field and shall include the following:

4.1.1 Name and location of job,

4.1.2 Date of boring—start, finish,

4.1.3 Boring number and coordinate, if available,

4.1.4 Surface elevation, if available,

4.1.5 Sample number and depth,

4.1.6 Method of advancing sampler, penetration and recovery lengths,

4.1.7 Type and size of sampler,

4.1.8 Description of soil,

4.1.9 Thickness of layer,

4.1.10 Depth to water surface; to loss of water; to artesian head; time at which reading was made,

4.1.11 Type and make of machine,

4.1.12 Size of casing, depth of cased hole,

4.1.13 Number of blows per 6 in. (0.15 m),

4.1.14 Names of crewmen, and

4.1.15 Weather, remarks.

1.0 INTRODUCTION

The Ford Motor Company, Twin Cities Assembly Plant (Plant) is located in St. Paul, Minnesota, at 966 South Mississippi River Boulevard. The Plant complex includes buildings on both sides of Mississippi River Boulevard. Buildings west of Mississippi River Boulevard are located below the river bluff on the river valley floor. Buildings east of Mississippi River Boulevard are located above the river bluff on the adjacent sand plains. The Plant location is presented on Figure 1.1.

The Plant was originally used to manufacture glass over 50 years ago. Since then the Plant has been expanded several times and is used to assemble motor vehicles. Presently the Plant is used to assemble pick-up trucks.

At different times during the Plant's history prior to 1970, paint sludges/wastes were deposited in a relatively small area on Plant property, west of Mississippi River Boulevard (Site C). This waste deposit was identified to U.S. EPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since that investigation was completed,

additional earth fill has been placed over part of the waste fill. The area is now used as a parking lot for tractor trailer truck units. Excavated materials from two other sites (Sites A and B) were subsequently moved to Site C. The locations of the fill Sites are also presented on Figure 1.1 and presented in more detail on Figure 1.2.

In an effort to address environmental issues that may be associated with past waste handling and disposal practices, Ford Motor Company (Ford) hired Conestoga-Rovers & Associates (CRA) to conduct an assessment of the wastes deposited at these sites. This assessment consisted of a file review, hydrogeologic evaluation, test hole excavation (test pits), stadia survey and waste characterization sampling. From these tasks an assessment and evaluation of site conditions was conducted. The results of these efforts are provided in the following sections of this report.

MN-COMP 0044284

2.0 BACKGROUND

At different times during the Plant's history, construction rubble and paint sludges/wastes were deposited in a relatively small area (Site C - approximately four acres in size) on Plant property west of Mississippi River Boulevard between the Boulevard and the Mississippi River. The majority of this material was deposited during the years 1950 through 1965. This practice was discontinued in 1965. During the years 1965 and 1966, construction debris was deposited in large quantities on top of this fill at Site C. The United States Corps of Engineers also deposited additional rubble between the Ford disposal Site and the river during reconstruction of the Lock and Dam No. 1 near the "Ford Bridge".

This Site C waste deposit was identified to the USEPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since the investigation was completed, additional fill has been placed over part of the Site C waste fill. Earth fill and construction rubble continue to be being brought to Site C including broken concrete and road excavation rubble from the construction of Mississippi River Boulevard. A major portion of the top of the fill has been paved with 8 inches of concrete and is now being used as a parking lot for

MN-COMP 0044287

CONESTOGA-ROVERS & ASSOCIATES

tractor-trailer truck units. The remaining top area of Site C is being used as a snow dump during winter months for snow removed from area streets and parking lots.

Excavated materials from Site A and Site B areas were subsequently moved to Site C. Information regarding this process was noted during CRA's file review and is discussed in the section that follows.

MN-COMP 0044288

3.0 FILE REVIEW

A file review was conducted to compile information related to the Plant's pre-1965 waste generation, disposal practices, investigations and activities on or near the Plant facilities. Plant files were reviewed on November 17, 1987. The Minnesota Pollution Control Agency (MPCA) files were reviewed on December 4, 1987. The majority of the information and correspondence in the Plant files is dated between and including the years 1980 and 1984. The information in the MPCA files is for the most part duplication of the Ford files with the addition of internal MPCA memos and reports.

It was noted that MPCA's files contain a separate file of all the groundwater monitoring data to date that has been submitted by Ford.

The file review indicates for Site C that cardboard, wood and scrap metal may also be present in the waste deposit. Batteries, used light ballasts and capacitors were specifically excluded from the fill material and were sent to alternate off-site disposal. Undated copies of photographs show exposed drums and what appears to be paint sludge at various locations.

MN-COMP 0044290

Two additional waste deposits are identified in the file. The first area (noted in a October 6, 1982 letter from Ford to MPCA in the files as Site A) was located at the south end of a former test track east of the assembly plant. Paint sludges/wastes were deposited in this area from around 1943 until 1960. Quantities were not reported. This area was excavated in 1966 during a railroad car loading "tri-level" expansion. Sludge and "eastern materials"* were deposited in the Site C area.

The second area (noted in a October 6, 1982 letter from Ford to MPCA in the file as Site B) was located approximately 800 feet south and east of the main assembly building. It was reported that the area was used for burning waste and burial of factory waste during early plant operations up until 1945. Exact operational dates and quantities were not reported. The area was excavated as part of a paved parking lot expansion in 1962. Excavated materials were placed in the fill area "at the steam plant" now called Site C.

The October 6, 1982 letter from Ford to MPCA, noted above, is provided as Appendix A.

MN-COMP 0044291

---

* A typographical error is suspected and "earthen materials" probably describes the excavated material.

In addition to the fill areas presently under review by CRA, a smaller waste deposit below the river bluff north of the steam plant was exavated and removed to a hazardous waste landfill (Wayne Disposal Inc., Bellville, Michigan) in July 1983 during construction of the wastewater treatment plant. Approximately 77 cubic yards was excavated and shipped. All waste observed as well as visibaly contaminated soils were removed. Analytical results of testing conducted by Ford confirmed that the waste did not exhibit hazardous waste characteristics. This effort was the subject of Ford's Amended Superfund Notification to USEPA dated August 16, 1983.

Aerial photographs from both files were used to prepare a plan illustrating the progression of fill at Site C from the access road westward. The limit of fill in 1945, 1956, 1958 and 1962 is illustrated on the Site Plan (enclosed). Filling with paint sludges/waste ceased in 1965. The limit of the paint sludges/wastes is expected to be close to the 1962 limit. Substantial filling with demolition rubble and excavation soil has occurred since 1965. The present limit of fill is also presented on the Site Plan. The paint sludges/wastes are buried beneath approximately 30 feet of rubble including large blocks of reinforced concrete. Total fill thickness throughout the area is approximately 60 feet. The fill thickness was estimated by constructing a cross section from topographic survey data and borehole logs. This information will be presented in Section 4.0.

MN-COMP 0044293

CONESTOGA-ROVERS & ASSOCIATES

Due to the relocation of the materials from Site A and B to Site C, the discussions dealing with hydrogeologic conditions and field activities in Sections 4.0 and 5.0 respectively, deal primarily with Site C.

MN-COMP 0044294

4.0 PRELIMINARY HYDROGEOLOGIC EVALUATION

4.1 GEOLOGY

Site C is located on a point bar adjacent to the Mississippi River (see Site Plan). A point bar is a fluvial deposit, usually sand and gravel, located on the inward bend of a river channel. Behind Site C is a river bluff which consists of bedrock overlain by unconsolidated sediments.

Geologic description of Site C is based on soil borings performed by Soil Testing Services (STS) in 1981*. Soil boring logs are presented in Appendix B. Their locations are illustrated on the Site Plan.

At Site C, the first bedrock unit encountered is the St. Peter Sandstone. The St. Peter Sandstone is encountered at soil boring B5 at an approximate elevation of 683 feet AMSL. The St. Peter Sandstone is a white fine to medium grained quartz arenite. The sandstone has a maximum

---

* Final Report, Hydrogeologic Engineering Evaluation, Ford Assembly Plant, St. Paul, Minnesota, Soil Testing Services of Minnesota, Inc. February 26, 1982.

MN-COMP 0044295

thickness of 150 feet. At the base of the St. Peter is a shale and siltstone unit that ranges in thickness from 5 to 50 feet (Guswa and others, 1982)*.

The Platteville Limestone, which overlies the St. Peter Sandstone, is present in the river bluffs. At the Site C, the Platteville Limestone is eroded away.

Overlying the St. Peter sandstone are consolidated sediments. At Site C, the sediment is described as an interbedded mixture of sand, silt and gravel with little clay. The sediment ranges in thickness from 25 feet to greater than 50 feet.

The sand and gravel deposit at Site C is overlain by artificial fill. The fill is composed of construction refuse, fire brick, slag and railroad ties intermixed with sand and gravel. Clean fill including construction rubble, broken concrete and soil continues to be placed west of Site C. In 1981, the Site C fill, as reported in the February 1982 STS report, ranged in thickness from 14 to 25 feet.

MN-COMP 0044296

---

* Preliminary Evaluation of the Groundwater Flow Systems in the Twin Cities Metropolitan Area, Minnesota, U.S. Geological Survey Water Resources Investigation Report 82-44.

Based on the soil borings, a geologic cross section of the Site C area has been constructed. The location of the cross section is presented in Figure 4.1 and the cross section is presented in Figure 4.2. The cross section indicates a maximum fill thickness in excess of 60 feet.

4.2 HYDROGEOLOGY

Groundwater is encountered in the unconsolidated sand and gravel at an approximate elevation of 690 feet AMSL. Well construction details and groundwater elevations are summarized in Table 4.1. Well locations are presented on Figure 4.1 and the Site Plan.

Groundwater elevations measured by CRA are presented on Figure 4.1 and indicate that groundwater flows towards the Mississippi River in a northwesterly direction.

The groundwater elevation at well B4 is considered anomalous. The well casing has been broken at depth permitting infiltration through the casing. The broken parts will not fit back-together indicating possible horizontal displacement. Well B2 nas an obstruction in the well. The obstruction prohibits access to the water level by water measuring instruments.

CONESTOGA-ROVERS & ASSOCIATES

MN-COMP 0044301

Groundwater is also encountered in the St. Peter Sandstone. The St. Peter aquifer is hydraulically connected to the overburden. The St. Peter aquifer has an average hydraulic conductivity of 2.3×10^{-3} ft/s and a transmissivity ranging from 18,000 to 45,000 gallons/day/foot (Walton and others, 1981)*. In the vicinity of the Site, the St. Peter is expected to discharge to the river and upward vertical gradients are expected to exist. Aqueous transport of any constituents in groundwater will be towards the river.

4.2.1 Site Hydraulic Conductivity

Grain size distribution curves are presented in the 1982 STS report. The grain size distribution can be used to estimate the permeability of the unconsolidated sand and gravel using Hazen's equation. Hazen's equation is an empirical formula that estimates permeability based on grain size distribution. Where:

$K = Ad_{10}^2$

K is the permeability in cm/s,

A is an empirical coefficient equal to 1.0 and

d_{10} is the grain size (in mm) of the 10 percent retained.

MN-COMP 0044302

* Engineering Geology of the St. Paul Energy Park and Vicinity, Minnesota Geology Survey, Reprint Series 44.

Estimated hydraulic conductivity values are presented in Table 4.2. The geometric mean hydraulic conductivity is 2×10^{-2} cm/sec. This is a relatively high hydraulic conductivity consistent with the sand and gravel soils.

Groundwater velocity can be estimated using the equation:

$$\bar{v} = \frac{Ki}{n}$$

where: $\bar{v}$ is the average groundwater linear velocity,

K is the hydraulic conductivity, (2×10^{-2} cm/sec)

i is the hydraulic gradient (0.002) and

n is the porosity (0.3).

The assumed porosity is 0.3, which is common for this type of sediment. The average hydraulic gradient is 0.002, based on groundwater elevations measured by CRA and presented on Figure 4.1.

By use of the above parameters, the average linear groundwater velocity is estimated to be 1.3×10^{-4} cm/sec, or 0.4 ft/day. In the approximately 40 years since materials have been deposited here, groundwater would have moved approximately one mile. The Mississippi River is within 200 feet of the present limit of fill, but was approixmately 800 feet away in 1945. In either case, groundwater from beneath Site C is entering the Mississippi River.

MN-COMP 0044303

TABLE 4.2

HAZEN'S PERMEABILITY

Borehole	Depth (ft. bgs)	d_{10} (mm)	K (cm/sec)
BH1	39.5 - 41	0.08	6×10^{-3}
BH2	19.5 - 21	0.25	6×10^{-2}
BH2	29.5 - 31	0.30	9×10^{-2}
BH2	34.5 - 36	0.075	5×10^{-3}

BH5	10 - 11.5	0.08	6×10^{-3}
		Average =	2×10^{-2}

MN-COMP 0044304

4.2.2 Hydrology

Another factor in groundwater flow is the influence of the Mississippi River, which fluctuates seasonally. Upstream from the Site is Lock and Dam No. 1. Lock and Dam No. 1 is used for waterway traffic and not for flood control.

According to the U.S. Army Corps of Engineers, which operates the dam, the tail stream elevation ranges from 691 to 687 feet AMSL.

The tail stream flooding frequency at Lock and Dam No. 1 was investigated, since the Site is located on a flood plain. The frequency and tail stream elevation provided by the Corps of Engineers are:

Frequency	Elevations (ft. AMSL)
10 years	707
50 years	714
100 years	717
500 years	724

Based on ground level elevations, it should be expected that wells B3 and B5 would be submerged on an average frequency of once every ten years. Submergence could have a very significant effect on groundwater quality measured in these wells.

MN-COMP 0044305

The tail stream elevation during the flood that occurred during April of 1965 was 719.02.

4.3 GROUNDWATER QUALITY

Groundwater samples were collected from the on-site monitoring wells on March 3, 1982, and December 1, 1982 by representatives from Ford's Stationary Source Environmental Control Office (SSECO). The results of this monitoring conducted by Ford are presented in the reports titled "Twin Cities Assembly Facility Groundwater Monitoring Wells Survey" and dated March 3, 1982 and December 1, 1982. The tables from these reports that summarize the monitoring data are provided for reference in Appendix C (for March 1982) and Appendix D (for December 1982). The samples were analyzed for USEPA Volatile Priority Pollutants, xylenes, methyl ethyl ketone, methyl isobutyl ketone, pH, specific conductivity and dissolved heavy metals (Cd, Cr, Pb, Cu, Ni, Zn).

Dissolved metals concentrations were low and within the range of typical groundwater concentrations*. Three VOC parameters, 1,2-Dichloroethylene, Trichloroethylene

---

* Handbook on the Toxicology of Metals Vol.2 Friberg, Nordberg and Vouk, Elseview Science Publishers, 1986.

MN-COMP 0044306

CONESTOGA-ROVERS & ASSOCIATES

and Toluene, were reported at low concentrations at three of the monitoring wells in place in March 1982. Total VOC at any individual location was less than 25 ug/L.

The same parameter list was monitored in December 1982. Dissolved metals were again typical of natural groundwater concentrations*. The concentration of 1,2-Dichloroethylene increased slightly in monitoring well B2, but the total VOC remained below 25 ug/L. Two additional VOC parameters, chlorobenzene and xylene, were reported at trace concentrations.

As expected, no measurable impact was defined upstream and downstream in the Mississippi River monitoring conducted by SSECO on December 1, 1982. Three VOC reported downstream of the Ford plant at trace concentrations were also reported at equal or higher concentrations upstream from the property.

---

* Handbook on the Toxicology of Metals Vo.1.2 Friberg, Nordberg and Vouk, Elseview Science Publishers, 1986.

5.0 FIELD ACTIVITIES

5.1 TEST PITS

On December 4, 1987, CRA and its subcontractor mobilized a rubber tired backhoe at Site C along the river. An attempt was made to gain access to the low land areas south of the trailer storage pad. Several attempts were made to reach the bluff, but on each attempt the backhoe got stuck. One test pit (TP1), shown on the Site Plan, was successfully completed. No evidence of past disposal (i.e. visual or odor) was noted at this test pit location.

On January 19, 1988, a second attempt was made to access this area. A track mounted backhoe was used this time and mobility was not as difficult due to frozen conditions. A total of 10 test pits were excavated to an approximate depth of nine feet below ground surface.

The individual test pit logs are presented in Appendix E. The test pit locations are presented on the Site Plan.

Physical evidence of waste presence (i.e. odor or visual) was noted only at test pits TP3 and TP8. Test pit TP3 exibited soil with a gray/black color having a

MN-COMP 0044307

CONESTOGA-ROVERS & ASSOCIATES

paint like odor and test pit TP8 showed visual evidence of the same gray/black color as TP3, but without the odor. No evidence of waste presence was noted at the other test pits. The steep side slopes and 30 foot thickness of rubble fill over the pre-1965 materials prevented collection of a samples.

Table 5.1 provides a summary of the analytical results of detected parameters for leachate analysis from test pits TP3 and TP8. A copy of the laboratory report of analysis is presented in Appendix F. Leachate analysis of the sample from test pit TP3 was conducted by Toxicity Characteristic Leachate Procedure (TCLP). The leachate for sample TP8 was obtained by the Extraction Procedure (EP) Toxicity Leachate Method.

The sample from TP3 was collected from a sand seam that exhibited a strong paint waste like odor. The strong paint waste like odor suggests migration from the adjacent fill material. The flash point of a soil sample collected from TP3 was reported to be 140°F. The flash point for determining ignitability defined by RCRA regulations of less than 140°F does not apply since the waste is not a liquid.

MN-COMP 0044308

TABLE 5.1

SUMMARY OF DETECTED INORGANIC PARAMETERS
AND SAMPLE CHARACTERISTICS

	EPA/Minnesota EP Toxicity Leachate Criteria	Test Pit 3 (TP3)**	Test Pit 8 (TP8)**
Arsenic (ug/L)	5,000	10	ND
Barium (mg/L)	100	1.5	0.2
Cadmium (mg/L)	1.0	ND	ND
Copper (mg/L)	100*	0.02	ND
Lead (mg/L)	5.0	0.3	ND
Zinc (mg/L)	500*	0.92	0.03
Flash Point (^{o}F)	NA	140	>200
Sulfide, Reactive (mg/kg)	NA	ND	61
pH	NA	7.6	7.9

Notes:

NA - Not Applicable
ND - Not Detected
* - State of Michigan Leachate Criteria Only
** - TP-3 sample analyzed using TCLP whereas the TP-8 sample was analyzed using EP Toxicity Leachate Procedure

CONESTOGA-ROVERS & ASSOCIATES

A sample from TP8 was leached and analyzed for the EP Toxicity metals. All results were well within criteria values as indicated on Table 5.1. Thus, the material would not be considered a hazardous waste under USEPA or MPCA hazardous waste regulations.

Organic results reported above detection methods in the sample leachate for TP3 are presented on Table 5.2. The sample from Test Pit 3 was extracted by the TCLP method. The sample from Test Pit 8 was analyzed for total VOC and all results were reported as below method detection limits. Therefore, no results are tabulated.

5.2 SITE SURVEY

On February 16, 1988, a stadia survey was completed of the Site C area to reelevaluate three wells which were extended vertically during the expansion of the trailer storage area. Table 4.1 shows the new elevations for these three wells (B1, B2 and B4) as well as the old elevations for wells B3 and B5 which were not extended and, for the purpose of the survey, assumed to be correct.

A base line was surveyed from existing buildings along Mississippi River Boulevard through the trailer storage area. Measurements were taken both north and

MN-COMP 0044310

CONESTOGA-ROVERS & ASSOCIATES

TABLE 5.2

SUMMARY OF DETECTED ORGANIC PARAMETERS (ug/L)

	Test Pit 3 (TP3)*
Toluene	180
Ethyl Benzene	85
M-Xylene	2,600
O & P Xylene	3,700

Notes:

* - TP3 sample was analyzed using TCLP

MN-COMP 0044311

south of this line to plot the present edge of the fill area. The surveyed edge of fill is presented on the Site Plan (enclosed) and Figure 4.1.

Due to the large amount of snow that had been piled along the top of the fill and the high seasonal snowfall, it was not possible to survey the low land areas and the test pit locations, or to accurately locate the top of the fill area.

Top fill area/pavement elevation should be added to site plan

MN-COMP 0044312

6.0 SUMMARY

File review indicates that two small waste deposits identified as Sites A and B were excavated during plant expansions in 1966 and 1962 respectively and moved to the river bluff fill area (Site C). Appendix A presents a 1982 Ford letter to MPCA found during the file review, that includes a figure that indicates the approximate locations of these sites. This report has dealt primarily with Site C due to the relocation of the material from Sites A and B to Site C.

As indicated on the Site Plan (enclosed), original base grade elevations under the fill pile were on the order of 710 to 720 ft. AMSL. Presently, the maximum elevation of the fill area is over 770 feet AMSL indicating that there is up to 60 feet of fill material present. Near the steam plant access road, paint sludges/waste are present in the lower half of the fill area. Small areas of exposed paint sludges/wastes on the steep bank suggest that the paint sludges/wastes are on the order of 25 feet thick.

A foot print of the area containing paint sludges/wastes can be composited from the 1958 and 1962 limits of fill. Assuming that there is 25 feet of waste and related fill over this area, there is a volume of

MN-COMP 0044313

approximately 30,000 cubic yards of waste material believed to be non-hazardous industrial waste based on the analyses conducted.

The paint sludges/wastes are buried beneath approximately 30 feet of rubble fill including large blocks of reinforced concrete. Exposing the paint sludges/wastes and related material would require removal of a concrete parking lot and excavation of approximately 50,000 cubic yards of fill. Any such excavation would be difficult and costly due to the limited access to the Site, the need to use remote temporary fill storage, the numerous oversize pieces of concrete in the material and disruption to plant operations.

Existing 8 inch concrete pavment covers most of the waste fill and limits infiltration through this material. The low concentration of VOC in groundwater under the Site is not expected to produce a measurable effect in the Mississippi River.

MN-COMP 0044314

Subject: [redacted] Cities Assembly Plant
[redacted] Waste Disposal Sites

Dear Mr. Day:

This letter is in response to your letter of August 19, 1982 and confirms our agreements reached during our meeting of September 23, 1982.

The two old disposal sites located near the main assembly building are shown on the attached map and are labeled "A" and "B" for clarification and subsequent reference. Site "A" was located at the southern end of an old test track located east of the assembly building. This site was excavated in 1966 and our inspection of the site during our meeting confirmed that approximately 15-20 feet of earth has been removed to bring the parking lot level (now covering the area) down to the assembly plant grade. This was visibly apparent due to the remaining section of higher level test track area. In view of this, you agreed that no further soil boring in this area would be required.

To the best of our knowledge Site "B" was located approximately 800 feet south and east of the old main assembly plant building. This location was noted on an old photograph, however, plant personnel have difficulty believing the site was so distant from the assembly operations. The area is presently used as a railroad yard. In an attempt to better define the exact location of the site, old aerial photographs have been obtained and will be examined to try and pinpoint the site. Following our review we will meet with you to discuss our findings and the need for soil borings in this area.

With respect to the disposal site located near the steam plant (Site "C"), we agreed to postpone any decision regarding the installation of an upgradient well until the additional work described below is

completed. This was based on the questionable value of a well at Location B6 (Former attempted boring location) and difficulty in boring into the St. Peter formation.

Ford agreed to install an additional monitoring well near old Boring B5, off plant property and within the City Park confines. The approximate location of the well is shown on the attached sketch of the disposal site. The well will be placed 10 feet into the water table and screened over the entire 10 feet. The well will be constructed of 2" PVC pipe as was used for the previously installed wells. Soil samples will be obtained during the boring.

Following the new well installation and development, all of the wells at the site will be re-surveyed to re-establish the casing top elevations. The wells will be measured for static water elevations and Mississippi River water elevations also obtained to determine its influence on the water table elevations. The wells, as well as the river, will be resampled and analyzed for dissolved heavy metals and volatile priority pollutants to obtain additional data on water quality.

Following this resampling and analyses we will meet with you to discuss further the need for additional investigation of this site and the necessity to install an upgradient well.

Our present schedule for this additional work is dependent upon obtaining your approval of the proposed location of the new well. Funding is being approved and we anticipate installing the well within two weeks of obtaining your concurrence with the well location. Samplings will be performed within two weeks of well completion and surveying and a report of our findings will be transmitted within four weeks of the sampling.

In addition, during the meeting, you agreed that Ford could remove some of the visible debris from the disposal site "C" in order to improve the appearance of the area. Any materials removed would be handled and disposed of in accordance with applicable regulations.

Kindly let me know as soon as possible of your decision regarding the well location. We would like to complete the sampling prior to the anticipated inclement weather your area is well noted for. If you have any questions please call me at 313/322-8852.

Very truly yours,

D. M. Reinke, Manager
Survey and Evaluation

Dissolved Metals
March 3, 1982

	B1	B2	B3	B4
Lead	0.12	<.05	<.05	0.06
Chromium	<.05	<.05	<.05	<.05
Nickel	0.07	0.04	0.03	0.05
Zinc	0.06	0.04	<.02	0.09
Cadmium	0.02	<.01	<.01	0.02
Copper	0.03	0.02	0.01	0.01

All values are the average of seven measurements of the same sample. Units are mg/l.

→ on previous page cancer is 0.02 mg/l

TABLE 4
Twin Cities Assembly Plant
Groundwater Monitoring Results
Volatile Organics
March 3, 1982

	B1	B1 (Dup)	B2	B2 (Dup)	B3	B3 (Dup)	B4	B4 (Dup)
1,2 Dichloroethylene	-	-	13	17	-	-	-	-
Trichloroethylene	4	3	5	5	-	-	-	-
Toluene	1	2	1	1	-	-	1	1

Duplicate field blanks showed no detectable levels of volatile organics.

Well casing blanks showed 4 PPB Toluene and 6 PPB methylene chloride, however these are attributed to the laboratory atmosphere.

Only detectable quantities are reported.

Rec'd CRA

MAR 23 88

Mr. Steven Mockenhaupt
Conestoga Rovers & Associates, Inc.
382 West County Road D
St. Paul, MN 55112

Dear Mr. Mockenhaupt:

Enclosed is the report of laboratory analyses for samples received 01/22/88.

If you have any questions concerning this report, please feel free to contact Tom Halverson, Bill Scruton or me.

Sincerely,

Roger C. Splinter, Ph.D.
Director, Laboratory Services

Mr. Jerome Amber
FORD MOTOR COMPANY
15201 Century Drive, Suite 608
Dearborn, Michigan 48120

Dear Mr. Amber:

RE: Groundwater Monitoring Report and Evaluation - Site C

Please find enclosed the subject draft report. The groundwater data contained in this report is currently undergoing QA/QC review. This review is expected to be completed within 10 days pending receipt of all necessary data for the analytical laboratory.

If additional monitoring is undertaken during 1990 at Site C, consideration should be given to installation of a well west of abandoned well B2 to essentially replace well B2. This well would need to be installed at the west toe of the fill rather than through the rubble of the fill to accomplish installation. This well is necessary, given the information generated by this investigation, to provide meaningful data to any future monitoring. A proposed well location is presented on the attached figure.

If you should have any questions, please do not hesitate to contact us.

Yours Very Truly,

CONESTOGA-ROVERS AND ASSOCIATES

1.0 INTRODUCTION

The Ford Motor Company, Twin Cities Assembly Plant (Plant) is located in St. Paul, Minnesota, at 966 South Mississippi River Boulevard. The Plant complex includes buildings on both sides of Mississippi River Boulevard. Buildings west of Mississippi River Boulevard are located above the river bluff on the adjacent sand plains. The Plant location is presented on Figure 1.1.

The Plant was originally used to manufacture glass over 50 years ago. Since then the Plant has been expanded several times and is used to assemble pick-up trucks.

At different times during the Plant's history prior to 1970, paint sludges/wastes were deposited in a relatively small area on Plant property, west of Mississippi River Boulevard (Site C). This waste deposit was identified to U.S. EPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since that investigation was completed, additional earth fill has been placed over part of the waste fill. The area is now used as a parking lot for tractor trailer truck units. Excavated materials from two other sites (Sites A and B) were subsequently moved to Site C. The locations of the fill Sites are also presented on Figure 1.1 and presented in more detail on Figure 1.2.

In an effort to address environmental issues that may be associated with past waste handling and disposal practices, Ford Motor Company (Ford) hired Conestoga-Rovers and Associates (CRA) to conduct an

CRA

assessment of the wastes deposited at these sites. This assessment consisted of a file review, hydrogeologic evaluation, test hole excavation (test pits), stadia survey and waste characterization sampling. From these tasks an assessment and evaluation of the site conditions was conducted. The results of these efforts are presented in a report titled "Assessment of Fill Areas, Ford Motor Company, Twin Cities Assembly Plant", dated October 25, 1988 by CRA.

The October 1988 report was reviewed and commented on by the MPCA in a letter dated February 7, 1989. The MPCA accepted the report and requested additional work. A work plan was submitted to MPCA to address their comments and requests on March 10, 1989, and was subsequently approved by MPCA on April 25, 1989. The scope of this additional investigation consisted primarily of three rounds of groundwater monitoring conducted over 1989. In addition, site wells were inspected, repaired and, if necessary, abandoned. Site area land features were also updated by survey.

This report represents a summary of the work completed as part of the Site C monitoring and environmental investigation.

2.0 BACKGROUND

At different times during the Plant's history, construction rubble and paint sludges/wastes were deposited in a relatively small area (Site C - approximately four acres in size) on Plant property west of Mississippi River Boulevard between the Boulevard and the Mississippi River. The majority of this material was deposited during the years 1950 through 1965. This practice was discontinued in 1965. During the years 1965 and 1966, construction debris was deposited in large quantities on top of this fill at Site C. The United States Corps of Engineers also deposited additional rubble between the Ford disposal Site and the river during reconstruction of the Lock and Dam No. 1 near the "Ford Bridge".

This Site C waste deposit was identified to the USEPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since the investigation was completed, additional clean fill has been placed over part of the Site C waste fill. Earth fill and construction rubble including broken concrete and road excavation rubble from the construction of Mississippi River Boulevard continue to be brought to Site C. A major potion of the top of the fill has been paved with 8 inches of concrete and is now used as a parking lot for tractor-trailer truck units. The remaining top area of Site C is used as a snow dump during winter months for snow removed from local public streets and parking lots.

3.0 FIELD ACTIVITIES

3.1 WELL REPAIR AND ABANDONMENT

On April 25, 1989, a well inspection was conducted of the existing monitoring wells at Site C. Upon completion of this inspection it was determined by CRA that wells B1, B3 and B5 could be made functional again. Wells B2 and B4 were damaged beyond repair by the continual dumping and regrading of rubble and fill in these areas.

In June of 1989, GME Consultants Inc., repaired wells B1, B3 and B5 by installing locking protective casings, bumper posts and additional riser pipes where necessary. Wells B2 and B4 were abandoned in accordance with the Minnesota Department of Health (MDH) water well code. The wells were grouted with a neat cement grout and all retrievable material was removed. Well abandonment records and logs are presented in Appendix A.

3.2 SITE C SURVEY

Following the repairs to wells B1, B3 and B5, a Site survey was completed to establish new top of casing elevations on these wells and to further define the top of fill area.

Table 3.1 presents the new well elevation data. Plan 1 (enclosed) shows the new top of fill area. It should be noted that filling and earth moving activities are still going on in this area and this plan represents the top of fill area as surveyed in September 1989.

3.3 GROUNDWATER SAMPLING

Three (3) rounds of groundwater and surface water sampling were completed according to the approved work plan. The samples were submitted to Pace Laboratories Inc. for chemical analysis under chain-of-custody procedures. The monitoring wells were purged and sampled using a precleaned* bottom filling stainless steel bailer. A minimum of three well volumes were purged prior to sampling. In the event that a well bailed dry prior to the removal of three well volumes, the well was allowed to recharge prior to sampling. The surface water samples were taken by the "Grab Sampling" method. The locations are close to, but may not be exactly the same as those previous sampled by Ford during earlier monitoring.

3.4 GROUNDWATER FLOW DIRECTION

Groundwater elevation data was obtained on June 2, 1989 and September 13, 1989. Groundwater elevations and groundwater flow directions are presented on Figures 3.1 and 3.2.

*Cleaning sequence consisted of: methanol-hexane-methanol rinse, air drying and distilled water rinse.

TABLE 3.1

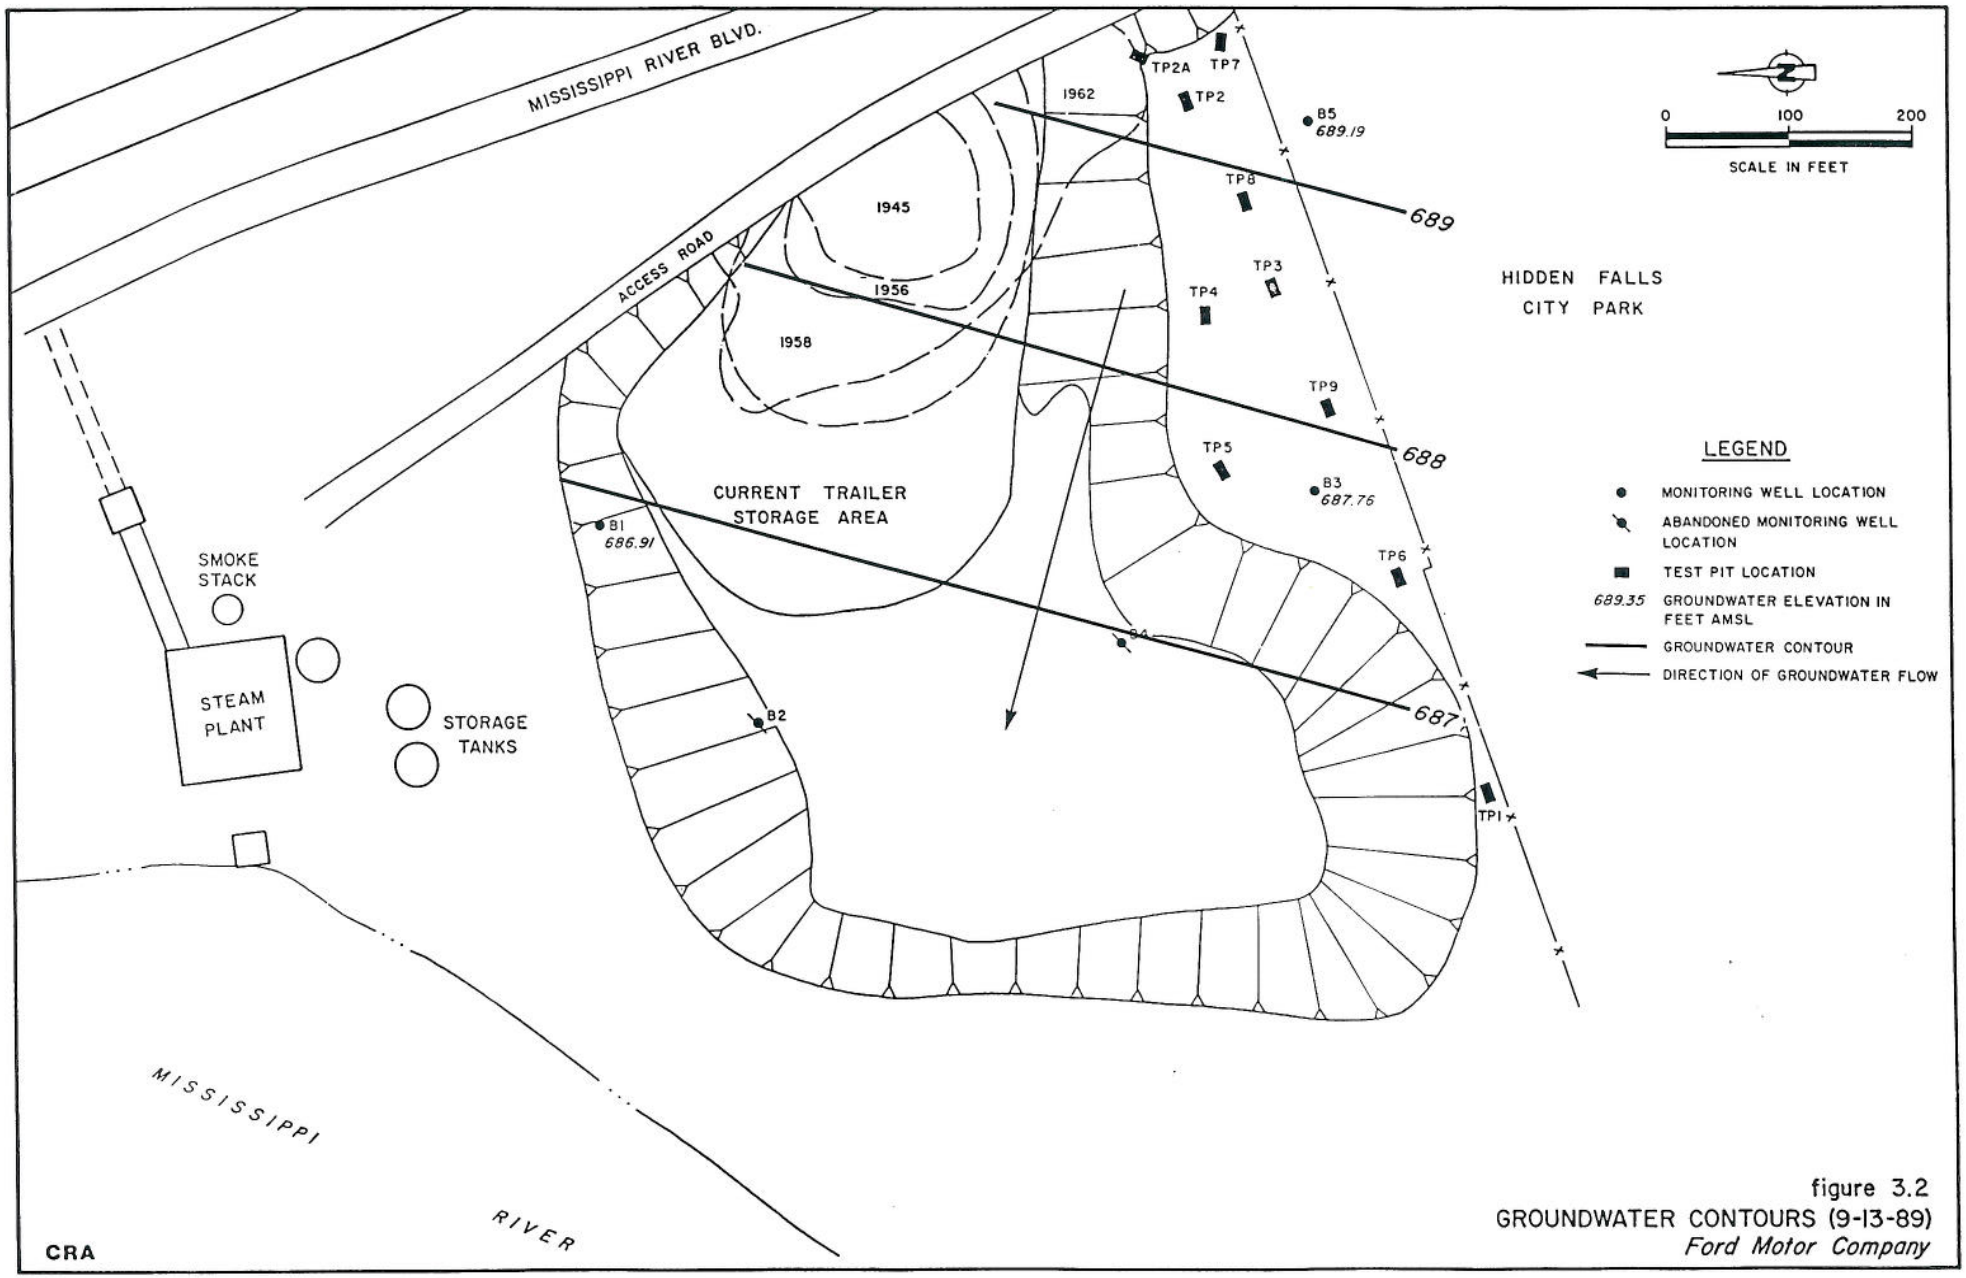

figure 3.2
GROUNDWATER CONTOURS (9-13-89)
Ford Motor Company

2853-11/27/89-M

Groundwater flow is predominantly to the west towards the Mississippi River. The river elevation may affect this flow direction to a minor degree. Water levels measured by CRA during 1988 had indicated a more northwesterly component of flow direction. Seasonal fluctuations in the river elevation also appear to change the gradients slightly as shown on Figures 3.1 and 3.2.

Groundwater elevations are measured in the existing monitoring wells which are screened in the fill and/or river deposits of sand and gravel. Thus, the groundwater flow directions represent a localized condition under the Site.

4.0 ANALYTICAL RESULTS

Results of the chemical analysis of groundwater and surface water are presented in Table 4.1. The analytical lab reports are presented in Appendix B. All water samples were analyzed for halocarbon and aromatic volatile organic compounds (VOC) by EPA methods 601 and 602. In addition to the 601/602 VOC parameters, the MPCA requested that cis-1,2-dichloroethylene and ethylacetate also be analyzed. This request was presented in their letter dated April 25, 1989. The following metals were also analyzed: Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Selenium, Silver and Zinc.

5.0 EVALUATION

Site C is comprised of fill and rubble material deposited over naturally occurring sands and gravels which were deposited by the Mississippi River. Groundwater under Site C flows towards the river and is influenced to some extent by the river. The data gathered from the existing monitoring wells represents site conditions in the immediate area under Site C. It is not known at this time whether or not the "perched" water under Site C is hydraulically connected to the underlying St. Peter Sandstone aquifer. On a regional scale, the St. Peter Sandstone and the Mississippi River are hydraulically connected.

The monitoring well network (wells B1, B3 and B5) at Site C is sufficient to determine general groundwater flow direction under Site C. However, given the groundwater flow directions calculated on June 6, 1989, and September 13, 1989, there is a gap in the monitoring network due to the loss of B2 and B4.

Evaluation of the groundwater quality data for 1989 (as presented on Table 4.1) indicates the following:

- measured concentrations for all metals tested (cadmium, lead, zinc, copper, nickel, chromium and barium) were all relatively low and typically acceptable for groundwater;

- low concentrations of four VOC were measured during the monitoring. The results are inconsistent from location to location and are not repeated in successive monitoring events at any one location. These inconsistent results indicate that VOC release from the Site is relatively small.

GME Project No. 2014

Re: Report for monitoring well abandonment and monitoring well surface protection at the Ford Plant in South St. Paul, Minnesota

Dear Mr. Mockenhaupt:

On March 3, 1989, we received authorization for the abandonment of existing monitoring wells, and the installation of surface protection at this site in Minneapolis, Minnesota. In accordance with your acceptance of our proposal, we have completed our services. This project was completed in compliance with our understanding of Minnesota Department of Health (MDH) regulations. Enclosed is our report including the MDH well abandonment logs, and a description of our services.

MONITORING WELL ABANDONMENT

Two existing monitoring wells (B-2 and B-4) were abandoned. Our drill crew retrieved as much down-hole 2 inch PVC riser pipe as possible by hand and with the Mobile B-24 rig. The wells were then grouted with neat cement to within two feet of the surface. Native soil was used to fill the remaining space in the boreholes.

You also requested that we upgrade the above ground protection for three existing monitoring wells at the site. Our drill crew installed three, 4 inch diameter by 8 foot long protective steel posts and one, 4 inch diameter by 5 foot long locking protective steel cap at B-1, B-3, and B-5. At B-5, the existing 2 inch PVC riser pipe was cut-off below grade and replaced with a new section. All the protective posts were cemented into place.

The monitoring well abandonment procedures and above ground protection installation were supervised by our Minnesota Licensed Water Well Driller in accordance with MDH regulations.

GENERAL QUALIFICATIONS

This report is a summary of the services performed at the Ford Plant site in South St. Paul, Minnesota. No warranty, either expressed or implied, is presented in this report with respect to the soil and groundwater conditions at this site.

We appreciate the opportunity to be of service to you for this project. If you have any questions regarding this report or if we may be of further assistance to you, please do not hesitate to contact us.

Sincerely,

GME CONSULTANTS, INC.

RE: PACE Project No. 890914.537
2853

Dear Mr. Michaels:

Enclosed is the report of laboratory analyses for samples received September 14, 1989.

If you have any questions concerning this report, please feel free to contact us.

Sincerely,

Susan D Max TS

1.0 INTRODUCTION

The Ford Motor Company, Twin Cities Assembly Plant (Plant) is located in St. Paul, Minnesota, at 966 South Mississippi River Boulevard. The Plant complex includes buildings on both sides of Mississippi River Boulevard. The Plant location is presented on Figure 1.1.

A more detailed chronology of the Plant's history is outlined in a report entitled "Groundwater Monitoring Report and Evaluation - Site C" dated January 24, 1990.

2.0 BACKGROUND

The Site C waste disposal area was reported to the USEPA by Ford during the Superfund notification process. The location of Site C is provided on Figure 1.1. Several hydrogeologic investigations were completed. The most recent investigation was presented in the report titled "Groundwater Monitoring Report and Evaluation - Site C". This report was submitted to the Minnesota Pollution Control Agency (MPCA) on January 24, 1990.

On January 31, 1990, a meeting was held with the MPCA to discuss the results of this report. The MPCA requested additional field work to be completed at Site C. On March 2, 1990, a work plan for supplemental groundwater monitoring was submitted to the MPCA. This work plan included the installation of an additional monitoring well and two rounds of groundwater and surface water sampling.

This monitoring report summarizes the data and evaluation results from these field activities.

MN-COMP 0044008

3.0 FIELD ACTIVITIES

3.1 MONITORING WELL INSTALLATION

CRA contracted GME Consultants Inc. to install the new monitoring well (MW-6). Work commenced on April 9, 1990, and was completed on April 10, 1990. The location of the new monitoring well (MW6) is shown on Figures 3.1, 3.2 and 3.3.

A CME 55 drill rig, using 4-1/4-inch inside diameter, hollow stem augers advanced the well boring. Split spoon samples were collected continuously to the bottom of the boring.

The monitoring well was completed using the following materials:

- 10-foot, 2.0-inch diameter, .10 slot stainless steel screen;
- 40-foot, 2.0-inch, low carbon steel riser;
- #10 silica sand pack;
- Bentonite slurry seal;
- Bentonite (approximately 3 percent) cement grout;
- 4.0-inch diameter locking protective casing;
- three 4.0-inch steel protective posts.

MN-COMP 0044009

The monitoring well was installed inside the auger annulus by backing the augers form the boring while simultaneously installing the sand pack. The sand pack was installed from the bottom to approximately 8 feet

above the top of the screen. Natural sand and gravel filled the annulus to approximately 26 feet BGS. A bentonite slurry seal approximately 3 feet thick was emplaced above the sand pack. The remaining auger annulus was backfilled by the tremie grout method using a mixture of bentonite and cement. Surface protection consisted of a 4.0-inch diameter locking protective casing and three steel bumper posts. The well completion log is presented in Appendix A.

The drill rig, augers, well materials and additional associated equipment were decontaminated using a high temperature, hot water steam rinse.

Well MW-6 was developed and stabilized following installation using a 2-inch stainless steel and teflon, bottom filling bailer. A minimum of five standing well volumes was purged. Field parameters of pH, conductivity and temperature were noted after each well volume. The well was considered stabilized after three consecutive volumes with readings of less than 5 percent variability were purged. In total, 44 well volumes were removed during development.

Table 3.1 presents the new well elevation data.

3.2 GROUNDWATER AND SURFACE WATER SAMPLING

Two (2) rounds of groundwater and surface water sampling were completed according to the approved work plan and the MPCA guidance manual "Procedures for Groundwater Monitoring; MPCA Guidelines"

MN-COMP 0044013

CONESTOGA-ROVERS & ASSOCIATES

December 1986. The samples were submitted to Pace Laboratories Inc. for chemical analysis under chain-of-custody procedures. The monitoring wells were purged and sampled using a precleaned* bottom filling stainless steel bailer. A minimum of three well volumes were purged prior to each sampling.

The surface water samples were taken by the "Grab Sampling" method. On the two sampling events, samples were obtained from both an upstream and downstream locations. These surface water locations are the same as the 1989 surface water sampling locations.

3.3 GROUNDWATER FLOW DIRECTION

Groundwater elevation data was obtained on April 19, 1990, June 6, 1990, and August 3, 1990. Groundwater elevations and groundwater flow directions are presented on Figures 3.1, 3.2 and 3.3.

Groundwater flow is predominantly to the west towards the Mississippi River. Seasonal control of the river elevation may affect this flow direction to some degree. Water levels measured by CRA during 1988, also presented on Table 3.1, had indicated a more northwesterly component of flow direction. A similar westerly flow pattern was also provided by data presented by Ford in December 1982 as also indicated on Table 3.1. Early groundwater elevations by Ford do not include well B5, as it was not installed until later in

*Cleaning sequence consisted of: methanol-hexane-methanol rinse, air drying and distilled water rinse.

CONEST MN-COMP 0044015

1982. Only the 1990 data includes the new well B6. Seasonal fluctuations in the river elevation also appear to change the gradients as shown on Figures 3.1, 3.2 and 3.3.

Figures 3.2 and 3.3 show a flow direction to the south for the western edge of Site C. These flow directions indicated that the river was recharging this portion of Site C. The Army Corp of Engineers maintain a staff gauge in the lower pool of Lock and Dam #1. The elevations of the river were approximately 3 feet higher during the June and August water level rounds when compared to the river elevation in April. The change in river elevation explains why groundwater flow for June and August are different than the flow direction for April.

Groundwater elevations are measured in the existing monitoring wells which are screened in the fill and/or river deposits of sand and gravel. Thus, the groundwater flow directions represent a localized condition under Site C.

MN-COMP 0044016

4.0 ANALYTICAL RESULTS

Results of the chemical analysis of groundwater and surface water are presented in Table 4.1. The analytical lab reports and the data validation memorandums are presented in Appendix B. All water samples were analyzed for halocarbon and aromatic volatile organic compounds (VOC) by EPA methods 601 and 602. In addition to the 601/602 VOC parameters, the MPCA requested that *cis*-1,2-dichloroethylene and ethylacetate also be analyzed. This request was presented in MPCA's letter dated April 25, 1989. The following metals were also analyzed: arsenic, selenium and mercury by Atomic Absorption Method and barium, cadmium, chromium, copper, lead, silver, zinc and nickel by inductively coupled plasma analysis (EPA Method 6010).

5.0 EVALUATION

The data gathered for the report on the existing monitoring well network at Site C indicate the following:

- A data quality assessment was conducted of the samples collected during the two sampling rounds. With minor exceptions, the data was found to be acceptable to assess analyte concentrations within groundwater and surface water at the Site (see footnotes to Table 4.1 and lab report validation, Appendix B).

- Groundwater flow direction under Site C flows predominantly west towards the Mississippi River.

- Groundwater chemical data gathered from this monitoring represents Site conditions in the immediate area under Site C.

- Chemical data from samples taken at the river indicate that Site C has had no impact on the river.

- Barium was the only analyte found above method detection limits in the river samples taken and was found at equal concentrations upstream and downstream of the Site.

- Results for June sampling for zinc and April sampling for copper were qualified as non-detect due to the presence of the analyte in the method blank.

MN-COMP 0044020

- Chemical data from the two rounds of sampling on wells B1, B3 and B6 indicate that wells B1 and B3 had no VOCs present during either sampling event.

- Well B6 had methylene chloride detected at 1.4 µg/*l* during the April sampling. This value was qualified as non-detect due to the presence of this analyte in the method blank.

- Chloroform was detected at well B6 during the April sampling event at a concentration of 3.9 µg/*l* but was not detected during the June event. Well B6 was downgradient of the Site during the April sampling event. Well B6 was not downgradient during the June sampling event, however, well B3 was. No VOCs were present in well B3 in either sampling event.

- During the June sampling, two analytes, *cis*-1,2-dichloroethylene and trichloroethylene, were detected at well B6 at concentrations of 5.5 and 0.5 µg/*l*, respectively. However, neither compound was detected during the earlier April event when B6 was more downgradient of the Site.

- The metals concentrations at all sampling locations are either not detected or at levels well below any concentrations of concern.

- The groundwater results from both 1989 and 1990 are inconsistent from location to location and are not repeated in successive monitoring events at any one location. These inconsistent results indicate that any VOC release

associated with the Site is insignificant. These results are similar in terms of their low levels to those found by Ford during 1982 monitoring at these wells.

- Review of all 1990 sampling data from both rounds indicates no analyte concentration at or near any applicable standards often used for comparison of water quality and purity (e.g. MCLs and RALs). All results for this supplemental 1990 monitoring were found well below RALs and MCLs.

- Based on site history and the prior results obtained, no further Site C monitoring is warranted.

REPORT OF LABORATORY ANALYSIS

MN. FILE COPY

May 14, 1990

MAY 17. 90

Mr. Jon Michaels
Conestoga Rovers & Associates, Inc.
382 West County Road D
St. Paul, MN 55112

RE: PACE Project No. 900419.524
2853 Ford Site C

Dear Mr. Michaels:

Enclosed is the report of laboratory analyses for samples received April 19, 1990.

If you have any questions concerning this report, please feel free to contact us.

Sincerely,

Helen L.S. Addie
Project Manager

MEMORANDUM

TO: Jon Christofferson

REFERENCE NO.: 2853

FROM: David Dempsey

DATE: June 7, 1990

RE: Data Quality Assessment and Validation for Seven Groundwater Samples Collected During the April 1990 Sampling Event at the Ford Site C Project Site

---

The following details a data quality assessment and validation for seven groundwater samples collected on April 19, 1990 at the Ford Site C Project Site. The samples were analyzed for site-specific parameters, namely, volatile organic compounds (VOC) and metals by Pace Laboratories, Inc. (Pace).[1] Quality assurance criteria were established by the analytical methods.[2]

Holding Time Periods

Holding time periods were established by the analytical methods and are summarized below:

VOC	-14 days from sample collection to completion of analysis
Metals	-6 months from sample collection to completion of analysis, except for mercury -28 days from sample collection to completion of analysis for mercury

As all samples met the above criteria, the data were found to be acceptable based upon the holding time periods.

Method Blank Samples

The potential for sample contamination through laboratory protocols was measured by means of method blank samples. The VOC method blank sample contained methylene chloride at a concentration of 1.42 µg/*l*. Methylene chloride data for samples

---

[1]Analytical methods were taken from 40 CFR Part 136 Appendix A and "Methods for Chemical Analysis of Water and Wastes", EPA-600/4-79-020, revised March 1983 and are summarized below:

VOC	-601/602
Metals	-200 Series

[2]Application of quality assurance criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses", February 1, 1988 and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses, July 1, 1988.

W-041990-JM-01, W-041990-JM-02 and W-041990-JM-03 were qualified as non-detect (U), as a result. Similarly, the metals method blank sample was found to contain analytes copper and zinc at concentrations of 0.023 mg/*l* and 0.05 mg/*l*, respectively. Sample W-041990-JM-06 had its copper datum qualified as non-detect (U), while no action upon the zinc data was required. Of interest was the fact that no method blank sample was reported for selenium. However, as all samples were reported to be free of selenium, no action upon the selenium data was necessary.

Surrogate Compounds Percent Recoveries (Surrogate Recoveries)

Individual sample performance for VOC analyses was to be monitored via surrogate recoveries. To date, no surrogate data have been received from Pace. Therefore, matrix spike/matrix spike duplicate data were solely used to judge the VOC data.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries

Matrix efficacy was monitored by MS/MSD analyses. An in-house sample at Pace underwent MS/MSD analyses for VOC. Therefore, direct application of these data was not possible. The method was shown to have been precise as the percent recoveries were within control limits established by Pace.

Sample W-041990-JM-04 underwent a matrix spike analysis for the metal analyte selenium, while sample W-041990-JM-06 had matrix spike analyses performed for metal analytes arsenic and zinc. All remaining metal analytes had matrix spike analyses performed upon in-house samples. Arsenic and selenium percent recoveries fell below the control limits set by Pace; therefore, the results for all samples for these analytes were qualified as estimated (UJ). As the percent recoveries for the remaining metals were within limits, the methods were shown to be accurate.

Laboratory Duplicate Analyses

The level of analytical precision for metals analyses was measured through laboratory duplicate analyses. The duplicate analysis for barium was performed upon sample W-041990-JM-02, while in-house samples at Pace were used for the remaining analytes duplicate analyses. Only lead analyses were shown to have an unacceptable level of precision. Therefore, all lead data were qualified as estimated (UJ).

Rinsate Sample

Cleanliness of sampling equipment was checked by collection of rinsate sample W-041990-JM-03. The only analyte detected within the sample was methylene chloride. However, this methylene chloride datum was qualified as non-detect (U) based upon the method blank sample. Therefore, the sampling equipment was properly cleaned prior to collection of samples.

Field Duplicate Samples

Overall precision of this sampling event was monitored by collection of field duplicate samples W-041990-JM-04 and W-041990-JM-05. Both samples were found to be free of all target analytes, indicating that an acceptable level of precision was achieved.

Overall Assessment

Methylene chloride data for sample W-041990-JM-01, W-041990-JM-02 and W-041990-JM-03 were qualified as non-detect (U) based upon method blank sample data. Metals analytes arsenic, lead and selenium had all results qualified as estimated (UJ). The remaining data were found to be acceptable for the quanitative assessment of analytes within the groundwater at the project site.

MEMORANDUM

TO: Steve Mockenhaupt REFERENCE NO.: 2853

FROM: Dave Dempsey DD DATE: August 1, 1990

RE: Data Quality Assessment and Validation for Seven Groundwater Samples Collected during the June 1990 Sampling Event at the Ford Site C Site

---

The following details a data quality assessment and validation for seven groundwater samples collected on June 6, 1990, at the Ford Site C site. Samples were analyzed for volatile organic compounds (VOC) and metals by Pace Laboratories Inc. (Pace).[1] Quality assurance criteria were established by analytical methods.[2]

Holding Time Periods

Holding time periods are established in analytical methods and are summarized below:

VOC - 14 days from sample collection to completion of analysis

Metals- 6 months from sample collection to completion of analysis, except for mercury
- 28 days from sample collection to completion of mercury analysis

Reviewing analysis dates showed that all holding time periods were met.

Method Blank Sample

Laboratory contamination of samples was checked for with method blank samples. The VOC method blank sample contained no target analytes. However, zinc was detected at a concentration of 0.066 mg/l within metals method blank sample. Zinc data for samples W-060690-RF-01, W-060690-RF-02, W-060690-RF-04 through W-060690-RF-06 were qualified as non-detect (U).

Surrogate Compound Percent Recoveries

Individual sample results for VOC analyses were assessed using surrogate compound fluorobenzene recoveries. Examining the recoveries revealed that VOC Method 602 was in control. No surrogate compound was used to check the accuracy of Method 601. Hence, MS/MSD recoveries were used to assess Method 601 results.

---

[1]Analytical methods are taken from 40 CFR Part 136, Appendix A, and "Chemical Methods for Analysis of Water and Wastes", USEPA-600/4-79-020, Revised March 1983 and are summarized below:

VOC - 40 CFR 601/602
Metals - USEPA 200 Series

[2]Application of quality assurance criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses", February 1, 1988, and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses", July 1, 1988.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries

Effects upon the data due to matrix interference were checked via MS/MSD analyses. Pace sample 21699 underwent VOC MS/MSD analyses. As all percent recoveries fell within limits, the level of precision was acceptable.

Sample W-060690-RF-07 underwent matrix spike analysis for target metals. The silver percent recovery was low. Therefore, silver data were qualified as estimated (UJ) for all samples.

Laboratory Duplicate Analyses

Precision for metals analyses was measured by means of duplicate analyses. Samples W-060690-RF-03 and W-060690-RF-06 had duplicate analyses for analytes mercury and selenium, respectively. Precision for both were acceptable. No other duplicate analyses were performed by Pace, therefore, field duplicate samples were used to assess precision.

Rinsate Sample

Cleanliness of sampling equipment was checked with rinsate sample W-060690-RF-01. Target VOC detected were 1,1,1-trichloroethane, tetrachloroethene and 1,1-dichloroethene. As all investigative samples were free of these analytes, no action upon the data was necessary.

Zinc was also detected within this sample. However, the zinc datum was qualified as non-detect (U) based upon the method blank sample.

Field Duplicate Samples

Precision was measured by collecting field duplicate samples W-060690-RF-04 and W-060690-RF-05. As both sets of data were within limits of agreement, the precision was acceptable.

Overall Assessment

Silver data were qualified as estimated (UJ) for all samples, while five samples had zinc data qualified as non-detect (U). Remaining data are acceptable to quantitatively assess target analyte concentrations.

1.0 INTRODUCTION

The Ford Motor Company (Ford), Twin Cities Assembly Plant (Plant) is located in St. Paul, Minnesota, at 966 South Mississippi River Boulevard (Site). The Site complex includes buildings on both sides of Mississippi River Boulevard. Buildings east of Mississippi River Boulevard are located above the river bluff on the adjacent sand plains. The Site location is presented on Figure 1.1.

The Plant was originally used to manufacture glass over 50 years ago. Since then the Plant has been expanded several times and is used to assemble pick-up trucks.

At different times during the Plant's history prior to 1970, paint sludges/wastes were deposited in a relatively small area on Site property, west of Mississippi River Boulevard (Site C). This waste deposit was reported to U.S. EPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since that investigation was completed, additional earth fill has been placed over part of the waste fill. The area is now used as a parking lot for tractor trailer truck units. Excavated materials from two other sites (Sites A and B) were subsequently moved to Site C. The locations of the fill Sites are presented on Figure 1.2. The three fill sites (A, B and C) were subsequently consolidated by MPCA and listed (Class C) as the Ford Twin Cities Assembly Plant during 1983 - 1984 on the Minnesota Pollution Control Agency (MPCA) Permanent List of Priorities.

LOCATION OF INVESTIGATION AREAS
Ford Motor Company

2853-17/08/90-M

To address environmental issues that may be associated with past waste handling and disposal practices, and to consolidate information related to past investigations, Ford hired Conestoga-Rovers and Associates (CRA) in 1987 to conduct an assessment of the wastes deposited at the Site. This assessment consisted of a file review, hydrogeologic evaluation, test hole excavation (test pits), stadia survey and waste characterization sampling. From these tasks an assessment and evaluation of the Site conditions was conducted and the results reported to MPCA during the fall of 1988.

Supplemental groundwater and surface water monitoring at Site C occurred during 1989 and 1990 at the request of MPCA.

During 1989, at the request of MPCA, a separate investigation was also conducted at the area designated Site B and subsequently reported to MPCA.

In order to formalize the investigation process, document the extensive work conducted to date and allow for a final decision regarding possible remedial action and/or delisting of the Site from the State's priority list, the MPCA notified Ford during April 1990 of its intention to issue a Request for Response Action (RFRA) for the Site. The RFRA requires Ford to plan and implement a Remedial Investigation and Feasibility Study (RI/FS) at the Site and report the results and recommendations to MPCA. The RFRA was issued on June 26, 1990.

MN-COMP 0044576

Since the issuance of the RFRA, MPCA requested Ford on August 13, 1990, to incorporate the scope of work of a separate underground storage tank (UST) investigation being conducted at the Site, under the direction of MPCA's Hazardous Waste Division, into the scope of work for the RI/FS.

The UST Site is an underground storage tank facility used for storage of waste (spent) solvents pending shipment off-site for recycling. The USTs received waste regulated by the Resource Conversation and Recovery Act (RCRA). Figure 1.2 presents the location of the UST Site. A work plan outlining a proposed investigation to determine the nature, extent and magnitude of the possible solvent release from the UST Site was presented to MPCA on April 6, 1990. MPCA now requests the UST Site investigation to be made part of the RI/FS scope of work.

This report provides the Work Plan for the RI/FS and is submitted in accordance with the RFRA Section IV B and C of Exhibit A (RI/FS Work Plan Submittal and Contents). The purpose of this report is to:

1. Collect and assemble all existing information and data from work conducted to date at the Site.

2. Provide a list of remedial technologies and treatment alternatives to be evaluated by the RI/FS.

MN-COMP 0044577

3. Provide a scope of field investigation work for the proposed RI/FS program.

4. Present a plan for project organization.

5. Provide a quality assurance and control plan in the RI/FS.

6. Present a plan for data management and retention of data and records.

7. Provide a summary of tasks to be conducted for a baseline risk assessment.

8. Provide a Site Security and Safety Plan.

9. Provide a plan to organize the flow of public information about the project.

10. Present a schedule for the RI/FS Work Plan tasks.

MN-COMP 0044578

2.0 BACKGROUND AND SITE HISTORY

2.1 GEOGRAPHIC SETTING

The Site covers an area of approximately 130 acres in the City of St. Paul. It is bordered by the Mississippi River and its gorge to the west, Ford Parkway to the north, Cleveland Avenue to the east and Hampshire Avenue/Mississippi River Boulevard to the south. The Site and plant location are presented on Figure 1.1.

Elevations at the Site range from 690 feet AMSL at the river to 850 feet AMSL on the east side of the property. The main assembly building is at an elevation of 830 feet. The existing topography was developed by a sequence of erosional and depositional events related to the post glacial drainage development of the Mississippi River.

2.2 GENERAL GEOLOGY

Flanking the present river gorge are "terrace features" which consist of level "shoulders" of alluvial sediment which are perched above the present gorge. The Site area exhibits two of these features, one at approximately 830 feet AMSL and one at approximately 850 feet AMSL. These terraces represent alluvial deposits formed during the earliest stages of the Mississippi River's development. Separating this area of alluvial terrace deposits from the

MN-COMP 0044579

river gorge bottom is a vertical bedrock bluff. More recent alluvial deposits fill the gorge. The terrace and gorge alluvial deposits consist of primarily medium to coarse grained sand and gravel.

The bedrock underlying the site, and lining the bluff consists of relatively flat lying limestone, shale and sandstone. Bedrock formations which outcrop on the Site are listed in descending order of age as follows: the Decorah Shale, Platteville Formation (mostly limestone and minor shale), Glenwood Shale and St. Peter Sandstone. The Decorah Shale is described as greenish gray, thin bedded and clay rich. Geologic maps of the Site area, supported by past work performed by CRA, indicate that the shale is partially to mostly eroded away towards the river bluff. Underlying the Decorah Shale is the Platteville Formation which is composed of thin to medium bedded limestone containing minor interbeds of shale. The Platteville is underlain by the Glenwood Shale, a greenish gray, clay rich formation. The St. Peter Formation is a well sorted, medium grained sandstone.

2.3 SITE DISPOSAL HISTORY

The Plant began operation over 50 years ago and was originally used to manufacture glass. Since then the Plant has been expanded several times and is presently used to assemble pick-up trucks.

A file review was conducted by CRA to compile information related to the Plant's pre-1965 waste generation, disposal practices, investigations

and activities on or near the Plant facilities. A summary of the file review information was presented in the report "Assessment of Fill Areas", October 1988, CRA. Plant files were reviewed on November 17, 1987. The MPCA files were reviewed on December 4, 1987. The majority of the information and correspondence in the Plant files is dated between and including the years 1980 and 1984. The information in the MPCA files is for the most part duplication of the Ford files with the addition of internal MPCA memos and reports.

Based on previous investigations and the RFRA, three areas at the plant have been identified as former fill sites. The sites have been designated as Site A, Site B and Site C and are shown on Figure 1.2.

During preparation of this work plan, aerial photographs were obtained and studied for the years 1945, 1956, 1958, 1962, 1983 and 1985. These photographs are enclosed under separate cover.

The aerial photograph for 1985 was utilized to summarize the extent of the past disposal at Sites A, B and C as could be determined from the study of the earlier aerial photographs. The areas delineated on the 1985 aerial photographs are based on observation of disturbed soil and vegetation on these earlier photographs and are, therefore, likely to be larger than the area used for actual disposal.

MN-COMP 0044581

Following are subsections which describe the waste disposal history at Sites A, B and C.

2.3.1 Site A Disposal History

Site A was located at the south end of a former test track east of the assembly plant. Figure 2.1 illustrates the location of Site A. Paint sludges/wastes were deposited in the area from 1943 to 1960. This area was excavated in 1966 during a railroad car loading "tri-level" expansion. Sludge and earthen materials were deposited in the fill area known as Site C.

2.3.2 Site B Disposal History

The Site B is located west of Site A and was used for burning and burial of plant waste during the early Plant operations until 1945. The area was excavated as part of a paved parking lot expansion in 1962. Figure 2.1 illustrates the location of Site B. The excavated materials were placed in the Site C fill area. Based on evaluation of the 1985 aerial photo, from which the maximum area of Site B ground disturbance has been delineated, a portion of the Site B area may now be Soo Line Railroad (Soo Line) property.

MN-COMP 0044583

figure 2.1
SITE PLAN
FILL SITES A & B AND UST SITE
Ford Motor Company

CRA

2853-17/08/90-M

2.3.3 Site C Disposal History

Site C is approximately 4 acres in size and is located on Ford property west of Mississippi River Boulevard between the Boulevard and the Mississippi River. Figure 2.2 illustrates the Site C fill area. At different times during the Plant's history, construction rubble and paint sludges/wastes were deposited in a relatively small area in Site C. The majority of this material was deposited during the years 1950 through 1965. This practice was discontinued in 1965. During the years 1965 and 1966, construction debris was deposited in large quantities on top of this fill at Site C. The United States Corps of Engineers also deposited additional rubble between Site C and the river during reconstruction of the Lock and Dam No. 1 near the "Ford Bridge" beginning in 1975.

The Site C waste deposit was identified to USEPA by Ford during the Superfund notification process. A hydrogeologic investigation was commissioned by Ford in 1981. Since that investigation was completed, additional clean fill was placed over part of the Site C waste fill. Earth fill and construction rubble, including broken concrete and road excavation rubble from the construction of Mississippi River Boulevard continue to be brought to Site C. A major portion of the top of the fill has been paved with 8 inches of concrete and is now used as a parking lot for tractor-trailer truck units. The remaining top area of Site C is used as a snow dump during winter months for snow removed from local public streets and parking lots.

The file review for Site C indicates that cardboard, wood and scrap metal may also be present in the waste deposit. Batteries, used light

ballasts and capacitors were specifically excluded from the fill material and were sent to alternate off-site disposal. Undated copies of photographs show, at that time, exposed drums and what appears to be paint sludge at various locations. This area was the subject of a beautification/landscaping program conducted during the spring of 1990 (see Section 2.7, page 27 of 41).

Aerial photographs from the file search were used to prepare a plan illustrating the progression of fill at Site C from the access road westward. The limit of fill in 1945, 1956, 1958 and 1962 is illustrated in Figure 2.2. Filling with paint sludges/waste ceased in 1965. The limit of the paint sludges/wastes is expected to be close to the 1962 limit. Substantial filling with demolition rubble and excavation soil has occurred since 1965. The present limit of fill is also presented on Figure 2.2. The paint/sludges/wastes are buried beneath approximately 30 feet of rubble including large blocks of reinforced concrete. Total fill thickness throughout the area is approximately 60 feet. The fill thickness was estimated by constructing a cross section from topographic survey data and borehole logs.

In addition to the fill areas that are under review by CRA, a smaller waste deposit below the river bluff north of Site C and the steam plant was excavated and removed to a hazardous waste landfill (Wayne Disposal Inc., Bellville, Michigan) in July 1983 during construction of the wastewater treatment plant. Approximately 77 cubic yards were excavated and shipped. All waste observed, as well as visibly contaminated soils, were removed. Analytical results of testing conducted by Ford confirmed that the waste did not exhibit hazardous waste characteristics. This effort was the subject of Ford's Amended Superfund

Notification to USEPA dated August 16, 1983. Further information regarding the waste characterization was also provided to MPCA in a letter dated March 2, 1990, which is provided as Appendix A.

2.4 INVESTIGATIVE WORK COMPLETED TO DATE

Several investigations have been completed since identification of the disposal sites by Ford. These studies include hydrogeological investigations, disposal area assessments, status reports and groundwater monitoring reports. The major studies completed to date are:

1) Final Report, Hydrogeologic Engineering Evaluation, February 1982, STS;
2) Twin Cities Assembly Facility, Groundwater Monitoring Wells Survey, March 1982, Ford;
3) Twin Cities Assembly Facility, Groundwater Monitoring Wells Survey, December 1982, Ford;
4) Assessment of Fill Areas, October 1988, CRA;
5) Project Status, Ford New Site B, November 1989, CRA;
6) Groundwater Monitoring Report and Evaluation, Site C, January 1990, CRA;
7) Supplemental Groundwater Monitoring Report and Evaluation for 1990, Site C, August 1990, CRA.

MN-COMP 0044587

2.5 SITE A EVALUATION

Site A has been included in previous reports evaluating the Site history and past disposal practices. No environmental field assessment work has been performed at Site A.

2.6 SITE B EVALUATION

The MPCA's interest in Site B was prompted by a citizen's "complaint" dated July 25, 1984 (subject of an MPCA letter dated April 25, 1989). The "complaint" described a location that was related to excavation for construction of a water line during July 1984. Representatives of Ford, CRA and MPCA defined an area of investigation in May 1989. The location of the Site B area is shown on Figure 2.1.

Field work completed by CRA at Site B includes:

6/89	Drilled two boreholes. Screened soil with HNu or OVA
6/89	Four soil samples analyzed for VOCs and metals
8/89	Drilled three boreholes. Screened soil with HNu or OVA
8/89	Installed three monitoring wells (MW1, MW2, MW3)
8/89	Groundwater elevations
8/89	Three soil samples analyzed for VOCs and metals
8/89	Sampled three wells for VOCs and metals

MN-COMP 0044588

9/89 Groundwater elevations

8/90 Groundwater elevations

All field work was conducted in accordance with the MPCA approved investigation scope of work as described in a June 6, 1989, letter to the MPCA. This letter is contained in Appendix A.

Site B Field Procedures

Initially, two soil borings were proposed. Analytical results of the two initial borings confirmed the presence of VOC. Due to visual appearance and odor in these borings, three additional borings/wells were completed. Locations are presented on Figure 2.3.

All boreholes were advanced using a truck mounted drilling rig advancing 3-1/4 ID hollow stem augers. The augers were steam cleaned between each boring. Soil samples were collected at 2-1/2 foot intervals using a 2 foot long by 2 inch diameter split spoon sampling apparatus. Sampling was conducted in accordance with ASTM methods. Between each sample collection, the split spoons were cleaned using a sequential rinse of methanol, hexane and methanol, followed by a distilled water rinse.

Soil samples were described and classified according to the Unified Soil Classification System. Soil samples were stored in laboratory prepared, 40 ml glass vials and 500 ml glass bottles.

During sampling, both the containerized soils and auger openings were scanned with either an HNu photoionization meter or an OVA flame ionization meter.

From four of the borings, one sample from above the water table was prepared and submitted for chemical analysis. At boring A (BH A) one sample from above and one sample from below the water table was submitted. Samples were sent to Pace Laboratories of Minneapolis, Minnesota (Pace) using chain of custody procedures. Table 2.1 presents a summary of soil samples obtained and indicates those selected and submitted for analysis. A summary of the soil analytical results is presented as Table 2.2.

Monitoring Well Installations

Three monitoring wells were installed to approximately 12 feet below ground surface (BGS). Wells were constructed with:

- 2 foot long by 2 inch diameter stainless steel continuous (#10) slot screens.
- 2 inch diameter low carbon steel riser.
- A sand pack (#30) placed around and 2 feet above the screen.
- A 2 foot bentonite seal.
- Bentonite - cement backfill to the surface.
- Locking protective casing and bumper posts.

CONESTOGA-ROVERS & ASSOCIATES

Borehole and monitoring well logs are contained in Appendix B.

Well Development and Sampling

Wells were developed using a bottom filling stainless steel bailer to surge and evacuate groundwater. A minimum of five well volumes were removed. Conductivity, pH and temperature were periodically noted.

Immediately following development, water samples were collected and submitted for chemical analysis to Pace.

The groundwater analytical results are presented as Table 2.3. Table 2.4 presents groundwater elevations and Figures 2.3 and 2.4 show the water table elevation contours for Site B.

Summary of Current Site B Evaluation

Geology

Site B is located approximately 1/4 mile east of the Mississippi River at an elevation of 830 feet AMSL. The river elevation is approximately 690 feet.

GROUNDWATER CONTOURS (9-13-89)
SITE "B"
Ford Motor Company

CRA

2853-17/10/89-M

The Site is situated on a level "terrace" feature, a remnant feature of a large post glacial Mississippi River.

Surficial geologic materials on the terrace consist of natural sand, silt and gravel deposited by the post glacial Mississippi river and, where altered by cultural activity, nonnative, assorted fill material is found.

Bedrock exists at or near the ground surface and is exposed in a bluff along the river valley. The bedrock consists of interlayered sandstones, shales and limestones of Ordovician age. The upper four formations are of primary importance with respect to groundwater hydrology and are listed in descending order of age as follows: Decorah Shale, Platteville Formation, Glenwood Shale and the St. Peter Formation.

Five borings were advanced at Site B, four of which intercepted bedrock at approximately 12 feet BGS. The fifth boring was terminated at 7-1/2 feet where auger refusal occurred.

Surficial materials in all boreholes consisted of intermixed poorly sorted sand, silt, clay and non-native fill material.

Bedrock was interpreted to be the upper member of the Platteville formation. The upper Platteville is described as a tan and gray, medium bedded dolomitic limestone containing interbedded grayish green shale.

MN-COMP 0044597

Hydrogeology

Groundwater was intercepted in all borings at approximately 10 feet BGS. Monitoring wells were installed to a depth of 12 feet BGS, penetrating a zone of saturation approximately 2 feet thick.

Wells were not advanced past 12 feet, the depth at which bedrock was encountered.

The uppermost saturated zone occurs in the unconsolidated fill material lying above the bedrock. Saturation may or may not extend continuously into the underlying Platteville formation.

Groundwater flow is generally towards the north. The average hydraulic gradient is calculated at 0.01. This is considered a shallow gradient. Figures 2.3 and 2.4 show the groundwater flow direction.

Groundwater flow direction in a shallow water table is subject to frequent change primarily attributable to fluctuations during recharge from rain fall events. Flow direction may also be influenced by cultural features (i.e., storm sewers, extensive pavement, drainage tiles, etc.).

Based on these observations, groundwater flow direction at Site B may be subject to frequent change, for there is extensive pavement to the north of the wells and borings. Located to the south is an area that is unpaved, allowing rainfall to infiltrate and recharge the water table. In theory,

groundwater would "mound" in the unpaved area and flow towards the north, paved area. After a certain period, flow direction could change as the groundwater system stabilizes, reaching steady state conditions.

Although no boreholes and wells penetrate the Platteville Formation, some conclusions can be reached regarding hydrogeologic characteristics. Regionally, the Platteville, in conjunction with the underlying Glenwood shale, is considered a hydrogeologic confining unit.

CRA's geologist examined bedrock outcroppings of the Decorah shale, Platteville limestone, Glenwood shale and the St. Peter sandstone in the vicinity of the Site for the purpose of examining hydrogeologic characteristics of these formations. Of particular interest was the presence of groundwater seepage emanating from the Platteville formation along the river bluff face. This was observed in several locations and, most notably, several hundred feet south of Site B at Hidden Falls Park. The presence of seeps indicates that groundwater, which may be perched, exists in the Platteville above the Glenwood Shale confining unit. Underlying the Platteville-Glenwood confining unit is the St. Peter sandstone.

HNu/OVA Results

An HNu photoionization device and/or an OVA flame ionization device was used to scan soils for organic vapors in the five boreholes. The results are shown on Table 2.1.

Summarizing the above results, HNu/OVA readings were detected above background levels and below the water table in BH A, BH B and MW1. Readings above background were observed at and below the water table in MW2. No above background readings were detected at MW3.

Soil Chemical Analysis Results

Soil samples were analyzed for halocarbon and aromatic organic compounds (by SW846 Methods 8010/8020) and the inorganic compounds listed on Table 2.2. Table 2.2 presents all inorganic analytical results, however, only detected compounds have been summarized for organics. Based on these inorganic data, cadmium, lead and zinc levels appeared to be present above typical background soils.

Ethylbenzene and total xylene were found above method detection limits (MDLs) in soil taken from boring MW-1. Ethylbenzene was also found above MDLs at BH B.

Groundwater Chemical Analysis Results

Groundwater samples were analyzed for halocarbon and aromatic organic compounds (by EPA Method 601 and 602) and the inorganic compounds listed on Table 2.3. Table 2.3 presents all inorganic analytical results, however, only detected compounds have been summarized for organics. These

MN-COMP 0044600

groundwater results indicate that inorganics were found at levels near MDLs. Results reported for zinc showed poor reproducibility between the sample and duplicate taken for well MW-2.

Levels of VOCs in well MW-3 were not detected above MDL or were found below levels noted in the field rinsate blank (i.e. for 1,1,1-trichloroethene). Detected levels were primarily found in well MW-2 (methylene chloride, 1,1-dichloroethylene, benzene and ethyl benzene) and varied from the sample to the duplicate for this well. Due to the poor reproducibility of VOC results, these data should be qualified as non-quantitative data. However, these data were acceptable for qualitative purposes. Two VOCs (methylene chloride and 1,1-dichloroethylene) were found in well MW-1. Based on the flow direction indicated for the August and September 1989 water levels, well MW-2 is currently the most upgradient of the wells installed.

2.7 SITE C EVALUATION

The majority of the environmental assessment work completed to date at the Plant has related to the investigation of Site C due to the relocation of the materials from Sites A and B. The Site C waste deposit was identified to the USEPA by Ford during the Superfund notification process. The first investigation was commissioned by Ford in 1981. A chronological list of the field work performed at Site C follows:

MN-COMP 0044601

5/81	Drilled six boreholes, installed four monitoring wells (B1, B2, B3, B4)	STS
1/82	Groundwater elevations	STS

6/90	Groundwater elevations	CRA
8/90	Groundwater elevations	CRA

In June of 1989, GME Consultants Inc. upgraded surface protection on wells B1, B3 and B5 by installing locking protective casings, bumper posts and additional riser pipes where necessary. Wells B2 and B4 had been damaged beyond repair by the continual dumping and regrading of rubble. Therefore, wells B2 and B4 were abandoned in accordance with the Minnesota Department of Health (MDH) water well code. The wells were grouted with a neat cement grout and all retrievable material was removed. Well abandonment records and logs are presented in Appendix C.

Following the repairs to wells B1, B3 and B5, a Site survey was completed to establish new top of casing elevations on these wells and to further define the top of fill area.

In April 1990, CRA contracted GME Consultants Inc. to install monitoring well MW-6.

A CME 55 drill rig, using 4-1/4 inch inside diameter, hollow stem augers advanced the well boring. Split spoon samples were collected continuously to the bottom of the boring.

The monitoring well was completed using the following materials:

MN-COMP 0044603

- 10-foot, 2.0-inch diameter, .10 slot stainless steel screen;
- 40-foot, 2.0-inch, low carbon steel riser;
- #10 silica sand pack;
- bentonite slurry seal;
- bentonite (approximately 3 percent) cement grout;
- 4.0-inch diameter locking protective casing;
- three 4.0-inch steel protective posts.

The monitoring well was installed inside the auger annulus by backing the augers from the boring while simultaneously installing the sand pack. The sand pack was installed from the bottom to approximately 8 feet above the top of the screen. Natural sand and gravel filled the annulus to approximately 26 feet BGS. A bentonite slurry seal approximately 3 feet thick was placed above the sand pack. The remaining auger annulus was backfilled by the tremie grout method using a mixture of bentonite and cement. Surface protection consists of a 4-inch diameter locking protective casing and three steel bumper posts.

The drill rig, augers, well materials and additional associated equipment were decontaminated using a high temperature, hot water steam rinse.

Well MW-6 was developed and stabilized following installation using a 2-inch stainless steel and teflon, bottom filling bailer. A minimum of five standing well volumes was purged. The well was considered

MN-COMP 0044604

stabilized after three consecutive volumes with readings of less than 5 percent variability were purged. In total, 44 well volumes were removed during development.

Monitoring well logs for B1, B3, B5 and MW-6 are contained in Appendix B.

Site C monitoring wells have been sampled on seven occasions. Table 2.5 presents a summary of the detected compounds for all seven sampling rounds. Table 2.6 presents water level elevation data. Water table contours are shown on Figures 2.5 and 2.6.

Groundwater and surface water sampling conducted by CRA was completed according to the approved work plan (provided in Appendix A) and the MPCA guidance manual "Procedures for Groundwater Monitoring; MPCA Guidelines" December 1986. The samples were submitted to Pace Laboratories Inc. for chemical analysis under chain-of-custody procedures.

The surface water samples were taken by the "grab sampling" method. On all five sampling events conducted by CRA, samples were obtained from both upstream and downstream locations. The surface water locations are close to, but may not be exactly the same as those previously sampled by Ford during earlier, 1981 and 1982, monitoring.

At the time of the June 1989 sampling event, the Site C area was inspected upstream and downstream for the presence of surface "seeps or springs", as suggested by MPCA's letter of April 25, 1989, to Ford. This inspection located no potential sampling locations of this type.

Groundwater Flow Direction

Groundwater flow is predominantly to the west towards the Mississippi River. Seasonal control of the river elevation may affect this flow direction to some degree. Water levels measured by CRA during 1988, also presented on Table 2.6, had indicated a more northwesterly component of flow direction. A similar westerly flow pattern was also provided by data presented by Ford in December 1982 as also indicated on Table 2.6. Early groundwater elevations by Ford do not include well B5, as it was not installed until later in 1982. Only the 1990 data includes the new well B6. Seasonal fluctuations in the river elevation also appear to change the gradients as shown on Figures 2.5 and 2.6.

Figure 2.6 shows a flow direction to the south for the western edge of Site C. This flow direction indicated that the river was recharging this portion of Site C. The Army Corp of Engineers maintains a staff gauge in the lower pool of Lock and Dam #1. The elevations of the river were approximately 3 feet higher during the June 1990 water level round when compared to the river elevation in April. The change in river elevations explains why groundwater flow for June is different than the flow direction for April.

MN-COMP 0044611

Groundwater elevations are measured in the existing monitoring wells which are screened in the fill and/or river deposits of sand and gravel. Thus, the groundwater flow directions represent a localized condition under Site C.

Site Hydraulic Conductivity

Grain size distribution curves are presented in the 1982 STS report. The grain size distribution can be used to estimate the permeability of the unconsolidated sand and gravel using Hazen's equation. Hazen's equation is an empirical formula that estimates permeability based on grain size distribution. Where:

$K = Ad_{10}^2$

K is the permeability in cm/s,

A is an empirical coefficient equal to 1.0 and

d_{10} is the grain size (in mm) of the 10 percent retained.

Estimated hydraulic conductivity values are presented in Table 2.7. The geometric mean hydraulic conductivity is 2×10^{-2} cm/sec. This is a relatively high hydraulic conductivity consistent with the sand and gravel soils.

Groundwater velocity can be estimated using the equation:

MN:COMP 0044612

TABLE 2.7

HAZEN'S PERMEABILITY
SITE C

Borehole	Depth (ft. bgs)	d_{10} (mm)	K (cm/sec)
BH1	39.5 - 41	0.08	6×10^{-3}
BH2	19.5 - 21	0.25	6×10^{-2}
BH2	29.5 - 31	0.30	9×10^{-2}
BH2	34.5 - 36	0.075	5×10^{-3}
BH3	19.5 - 21	0.2	4×10^{-2}
BH5	10 - 11.5	0.08	6×10^{-3}
			Average = 2×10^{-2}

MN-COMP 0044613

$$\bar{v} = \frac{Ki}{n}$$

where: $\bar{v}$ is the average groundwater linear velocity,

K is the hydraulic conductivity (2×10^{-2} cm/sec),

i is the hydraulic gradient (0.002) and

n is the porosity (0.3).

The assumed porosity of 0.3, which is common for this type of sediment. The average hydraulic gradient is 0.002.

By solving the equation, the average linear groundwater velocity is estimated to be 1.3×10^{-4} cm/sec, or 0.4 ft/day.

Analytical Parameters

All water samples were analyzed for halocarbon and aromatic volatile organic compounds (VOC) by EPA methods 601 and 602. In addition to the 601/602 VOC parameters, the MPCA requested that *cis*-1,2-dichloroethylene and ethylacetate also be analyzed. This request was presented in their letter dated April 25, 1989. The following metals were also analyzed: arsenic, barium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver and zinc.

MN-COMP 0044614

The two sampling rounds conducted by Ford in 1982 were analyzed for USEPA volatile priority pollutants plus xylenes, methyl ethyl ketone, methyl isobutyl ketone, cadmium, chromium, lead, nickel, copper and zinc.

Test Pit Investigation

Test pits were excavated at Site C as an investigative tool to define the extent and nature of possible waste disposal.

On December 4, 1987, CRA and its subcontractor mobilized a rubber tired backhoe at Site C along the river. An attempt was made to gain access to the low land areas south of the trailer storage pad. Several attempts were made to reach the bluff, but on each attempt the backhoe got stuck. One test pit (TP1), shown on the Site C Plan, was successfully completed. No evidence of past disposal (i.e. visual or odor) was noted at this test pit location.

On January 19, 1988, a second attempt was made to access this area. A track mounted backhoe was used this time and mobility was not as difficult due to frozen conditions. A total of 10 test pits were excavated to an approximate depth of nine feet below ground surface.

The individual test pit logs are presented in Appendix D. The test pit locations are presented on Figure 2.2 and the Site C Fill Area Site Plan which is provided under separate cover.

MN-COMP 0044615

Grab samples were obtained from the backhoe bucket as the excavation proceeded. Physical evidence of waste presence (i.e. odor or visual) was noted only at test pits TP3 and TP8. Test pit TP3 exhibited soil with a gray/black color having a paint-like odor and test pit TP8 showed visual evidence of the same gray/black color as TP3, but without the odor. The samples obtained from test pits TP3 and TP8 were the only samples that exhibited odor or color indicating the possible presence of paint sludge/waste. No evidence of waste presence was noted at the other test pits. The steep side slopes and 30 foot thickness of rubble fill over the pre-1965 materials prevented collection of a sample.

The sample from test pit TP8 exhibited a color change at depth, but no odor was noted. Consequently, this sample was analyzed for target metals common to paint sludge/waste. This analysis was conducted using the standard EPA approved Extraction Procedure (EP) toxicity leachate methodology.

The sample from test pit TP3 exhibited a paint sludge/waste-like odor. As the EP toxicity test is not applicable to aromatic compounds, the Toxicity Characteristic Leaching Procedure (TCLP) was selected as the test method. At the time of the investigation this method was typically utilized to :

1. to aid in waste characterization for disposal, –
2. as an accepted EPA method for delisting wastes,

3. in evaluating adherence to applicable EPA land disposal restrictions and
4. in determining the mobility of organics in soil media.

The TCLP method was recently adopted by EPA to replace the EP method.

Table 2.8 provides a summary of the analytical results of detected parameters for leachate analysis from test pits TP3 and TP8.

The sample from TP3 was collected from a sand seam that exhibited a strong paint waste-like odor. The strong paint waste-like odor suggests migration from the adjacent fill material. The flash point of a sample collected from TP3 was reported to be 140°F. The flash point for determining ignitability defined by RCRA regulations of less than 140°F does not apply since the waste is not a liquid.

A sample from TP8 was leached and analyzed for the EP Toxicity metals. All results were well within criteria values as indicated on Table 2.8. Thus, the material would not be considered a hazardous waste under USEPA or MPCA hazardous waste regulations.

Organic results reported above detection methods in the sample leachate for TP3 are presented in Table 2.9. The sample from Test Pit 3

was extracted by the TCLP method. The sample from Test Pit 8 was analyzed for total VOC and all results were reported as below method detection limits. Therefore, no results are tabulated.

Cleanup and Landscaping of the Site C Area

During the spring of 1990, aesthetic beautification and landscaping was completed on a portion of the south face of the Site C fill area. The work was performed after the completion of the above investigation and material characterization and in accordance with the proposed scope of work letter of March 2, 1990. An area was delineated by the landscaping contractor with input from Ford and the MPCA. Brush, several trees, empty drums, drum parts and miscellaneous rubble were cleared from the defined area and used as fill. Approximately 2,000 cubic yards of clay soil plus 500 cubic yards of topsoil was placed over the sloped face and then seeded for aesthetic and erosion control purposes.

Site C Evaluation Summary

Site C is comprised of fill and rubble material deposited over naturally occurring sands and gravels which were deposited by the Mississippi River. Groundwater under Site C flows towards the river and is influenced by the river. The data gathered from the existing monitoring wells represents site conditions in the immediate area under Site C.

Original base grade elevations under the fill pile were on the order of 710 to 720 feet AMSL. Presently, the maximum elevation of the fill area is over 770 feet AMSL, indicating that there is up to 60 feet of fill material present. Near the steam plant access road, paint sludges/waste are present in the lower half of the fill area. Small areas of exposed paint sludges/wastes on the steep bank suggest that the paint sludges/wastes are on the order of 25 feet thick.

A footprint of the area containing paint sludges/wastes can be composited from the 1958 and 1962 limits of fill. Assuming that there is 25 feet of waste and related fill over this area, there is a volume of approximately 30,000 cubic yards of waste material believed to be non-hazardous industrial waste based on the analyses conducted.

The paint sludges/wastes are buried beneath approximately 30 feet of rubble fill including large blocks of reinforced concrete. Exposing the paint sludges/wastes and related material would require removal of a concrete parking lot and excavation of approximately 50,000 cubic yards of fill. Any such excavation would be difficult and costly due to the limited access to the Site, the need to use remote temporary fill storage, the numerous oversize pieces of concrete in the material and disruption to plant operations.

MN-COMP 0044621

Existing 8 inch concrete pavement covers most of the waste fill and limits infiltration through this material. The low concentration of VOC in groundwater under the Site is not expected to produce a measurable effect in the Mississippi River.

The following summarizes the groundwater and chemical data evaluation for Site C:

- The monitoring well network (wells B1, B3, B5 and B6) at Site C is sufficient to determine that the groundwater flow direction under Site C flows predominantly west towards the Mississippi River.

- Groundwater chemical data gathered from this monitoring represents Site conditions in the immediate area under Site C.

- Chemical data from samples taken at the river indicate that Site C has had no impact on the river.

- Data quality assessments were conducted of the samples collected during the five sampling rounds conducted by CRA (1989/1990). With minor exceptions, the data was found to be acceptable to assess analyte concentrations within groundwater and surface water at the Site.

- Concentrations for the dissolved metals (cadmium, zinc, copper, nickel, chromium and barium) were either below method detection limits or were low and typically acceptable for naturally occurring groundwater.

- The groundwater results from 1989 and 1990 are inconsistent from location to location and are not repeated in successive monitoring events at any one location. These inconsistent results indicate that any VOC release associated with the Site is insignificant. These results are similar in terms of their low levels to those found by Ford during 1982 monitoring at these wells.

- The metals concentrations at all sampling locations are either not detected or at levels well below any concentration of concern.

- Barium was the only analyte found above method detection limits in the river samples taken during 1990 sampling and was found at equal concentrations upstream and downstream of the Site.

- Results for June 1990 sampling for zinc and April 1990 sampling for copper were qualified as non-detect due to the presence of the analyte in the method blank.

- Chemical data from the two rounds of sampling during 1990 on wells B1, B3 and B6 indicate that wells B1 and B3 had no VOCs present during either sampling event.

- Well B6 had methylene chloride detected at 1.4 µg/*l* during the April 1990 sampling. This value was qualified as non-detect due to the presence of this analyte in the method blank.

- Chloroform was detected at well B6 during the April 1990 sampling event at a concentration of 3.9 µg/*l* but was not detected during the June 1990 event. Well B6 was downgradient of the Site during the April sampling event. Well B6 was not downgradient during the June sampling event, however, well B3 was. No VOCs were present in well B3 in either sampling event.

- During the June 1990 sampling, two analytes, *cis*-1,2-dichloroethylene and trichloroetheylnee, were detected at well B6 at concentrations of 5.5 and 0.5 µg/*l*, respectively. However, neither compound was detected during the earlier April 1990 event when B6 was more downgradient of the Site.

- Review of all 1990 sampling data from both rounds indicates no analyte concentration at or near any applicable standards often used for comparison of water quality and purity (e.g. MCLs and RALs). All results for this supplemental 1990 monitoring were found well below RALs and MCLs.

2.8 UST SITE - BACKGROUND

Chronology

Prior to the 1970s, the UST Site was an open area located to the southeast of the former test track. Before the tanks were installed the UST Site was not used for waste handling or activities related to disposal. The location of the waste solvent tanks is shown on Figure 2.1. The more detailed UST Site Plan is enclosed under separate cover.

During the fall of 1984, Ford constructed the UST Site as part of its "Ranger" paint facility expansion, initially to store paints, resin and new solvent brought to the Ford Plant in bulk transport trucks. The double walled, corrosion protected, steel tanks were installed on 24 inch thick concrete pads. However, the UST facility was never used for this purpose and in 1987, Ford decided to utilize the facility to store waste or spent solvent. At that time it was decided that only two (2) of the four (4) tanks (the south two tanks) would be utilized. These tanks are designated as tanks #1 and #2. The fill lines were modified by reversing the check valve system and the installation of quick disconnect fittings for transport truck hook up. Tank #1 was put into use in 1987. Tank #2 was put into use in 1988. Both tanks are operated in conformance with 40 CFR 264, Subpart J.

Geotechnical Information and Construction Plans

Information was located in Ford's files and compiled to review available data for the UST Site area regarding:

- Site geology,
- excavation and filling that has occurred in the Site area,
- the physical construction of the area facilities,
- the location maps and types of utilities present,
- geotechnical soil boring logs,
- topographical maps and Site grading,
- construction drawings for UST Site facility,
- construction drawings for adjacent hazardous waste storage area.

For this purpose the following information was located and utilized.

Drawings Title or Item Description	Drawing #	Date
Partial Site Grading Plan	CE-2	1983 (revised 1985)
Topographical Survey Partial	TS-3	1983
Topographical Survey Partial	TS-4	1983
Solvent Tank Farm Layout	M-50	1983 (revised 1985)

Solvent Tank Farm Cathodic Protection	M-51	1983 (revised 1985)
Solvent Tank Farm Cathodic Protection	M-52	1983 (revised 1985)
Key Plan Sections	M-53	1984 (revised 1985)

This information is enclosed under a separate cover.

A geotechnical investigation was performed for the hazardous waste storage area in 1984. The report and borehole logs for the investigation are provided in Appendix F.

It should be noted that no information was located regarding the propane storage tank area.

Description of System

An illustration of the UST Site facility is presented on the UST Site Plan which is provided under separate cover. Further detail is provided by Ford Plans M-50, M-51, M-52 and CE-2. The facility consists of the following elements:

1. four tanks of double wall construction type, 10,000 gallon capacity each. Tanks are 8' 0" x 26' 7";
2. related fill, vent, vapor recovery and pump out pipe lines, an access pipe/manhole hatch is also provided, as well as related valves and gauges;
3. each tank was also coated with an asphalt-based coating prior to installation;

4. corrosion prevention is provided by cathodic protection on all tanks, lines and associate fittings;
5. check valves on pump out lines;
6. catch basins located at the pump out line access;
7. the size of the drain tile line is 4-inch, perforated pipe, sloped in the direction of sump;
8. vacuum test fittings;
9. tanks sit on a concrete pad of 48 feet x 30 feet and are anchored to the pad;
10. the concrete manhole sump is located at the north end of the drain tile system.

UST Site Geology and Hydrogeology

Geology

The UST Site is located approximately five-eighths of a mile east of the Mississippi River and is situated at an approximate elevation of 850 feet AMSL on a terrace which flanks the present river gorge. The UST Site area exhibits two of these terrace features, one at approximately 850 feet AMSL and one at approximately 830 feet AMSL. The river elevation is approximately 690 feet AMSL. The UST Site's position on the terrace is near the slope (terrace scarp) which separates the 850 foot terrace from the 830 foot terrace.

Boring logs were reviewed that were obtained during the construction of the present hazardous waste storage area located adjacent to the

UST Site. These logs revealed that the terrace alluvium consists of primarily medium to coarse grained sand and gravel. Bedrock was encountered between 4 and 6 feet BGS.

The bedrock at the UST Site consists of weathered Decorah Shale. Geologic maps of the Site area, supported by past work performed by CRA, indicate that the shale is partially to mostly eroded away just to the west of the UST Site. Underlying the Decorah Shale is the Platteville Formation which is underlain by the Glenwood Shale.

Based on a review of the UST construction plans and previously noted boring logs, it appears that the excavation which houses the tank farm is completed several feet into the Decorah shale. The bottom of the excavation lies at approximately 12 feet BGS which in effect has created a "basin" up to 6 feet in depth in the top of the shale unit. Hereafter this excavation will be referred to as the UST tank basin.

Figures 2.7 and 2.8 present a location of cross section and a geologic cross section, respectively, which represent the interrelationships of: the UST Site and tank basin, terrace features, surficial alluvium, Decorah Shale, Platteville Formation and Glenwood Shale.

Hydrogeology

The previously completed borings reveal that groundwater exists below the UST Site within the alluvial sediment, perched above the

Decorah Shale. The alluvial sand and gravel, in general, will readily transmit groundwater. Hydrogeologic literature describes the Decorah Shale as a confining unit. Hydraulic conductivities within the Decorah are low. The underlying Platteville Formation contains groundwater within its fracture systems. This groundwater discharges at the bluff which lines the Mississippi River gorge.

Of particular importance is the relationship of the groundwater perched above the Decorah shale to the UST Site. Some basic assumptions can be made regarding groundwater flow. It is expected that the perched groundwater will flow horizontally along the Decorah Shale towards the lower terrace feature to the southwest. The volume of groundwater will fluctuate significantly in response to rainfall and recharge.

The UST Site could in itself impose an influence on perched groundwater occurrence. Surface runoff is presently draining into the UST tank basin. This will in effect recharge the aquifer on a very local level. There is presently a tile drainage system which directs the basin's water into a sump. It is hypothesized that groundwater could also flow horizontally, unimpeded, through the tank basin. Additionally, pumping in the sump could effect a drawdown in the shallow groundwater system.

Additional influences on UST Site groundwater characteristics may be affected by storm sewer lines and utility trenching.

MN-COMP 0044631

Waste Characterization

Solvent Waste Stored in Tanks

Since its initial use, the UST Site has been used only for waste solvent storage. The same types of solvents have always been stored in both the tanks. These spent solvents are primarily generated from auto body painting operations. The following provides a description of materials that when used become part of this waste stream.

Paint

Ford uses a variety of paints in the paint building operations including various colors of top coat paint and clear coat.

Solvent

Ford presently uses a variety of solvents in the painting/manufacturing operations. Some of these solvents are listed RCRA wastes when spent. The major solvent components are:

- xylene,
- toluene,
- methyl isobutyl ketone (MIBK),
- butanol,

MN-COMP 0044632

- Cellosolve 100 (Aromatic 100), a solvent blend,
- Cellosolve 150 (Aromatic 150), a solvent blend.

The waste solvent material stored at the UST Site has been tested periodically in order to characterize it for waste disposal and recycling. The waste solvent has been characterized as EPA waste number F005 under RCRA regulations. Appendix G provides a sample analysis for a first load of solvent shipped from the tanks. This analysis indicates the following characteristics:

- percent each solvent/organic
  45 percent xylene
  13.5 percent MIBK
  12.5 percent toluene
- waste density: 0.882

Metals analysis was not conducted on the sample.

The two waste streams stored in these tanks are recycled for reuse by Ford. A quantity of approximately 150,000 gallons is typically generated per year.

Soil Samples Taken During Investigative Excavation

On November 6, 1989, Ford excavated an area at the UST Site in an effort to determine whether a release may have occurred in the vicinity

MN-COMP 0044633

of these tanks. This followed an October 26, 1989, meeting with Minnesota Pollution Control Agency (MPCA) at which the possibility of a solvent release was discussed. Following this meeting, Ford hired a contractor to excavate the area near tanks #1 and #2. The MPCA was notified and was present for the work. The excavation proceeded to approximately 4 feet BGS at which point the very top west end of tank #1 was exposed, as was the access pump out and vapor vent piping. At this point, the odor level, apparently solvent vapors, was such that following consultation with the MPCA, Ford discontinued excavating. The hole was left open to the point that had been accomplished and the materials that had been excavated were placed on a plastic tarp and covered for storage until a determination was made as to whether further excavation would occur.

During excavation one sample was taken by Ford for laboratory analysis. This sample was obtained from the area near the top of tank #1. The sample was submitted by Ford to Pace Laboratories Inc. of Golden Valley, Minnesota (Pace), and analyzed for MDH List 465C of Volatile Organic Compounds (VOCs). No total metals analysis was conducted. Results were received by Ford and are provided as Appendix H. The results indicate concentrations above method detection limits for xylenes, ethylbenzene, toluene, methylene chloride and 1,1,2-trichlorotrifluoroethane (in order of concentration found from greatest to least).

Based on the observation of stained ground cover prior to excavation and the proximity to the pump stations used for transport truck tank unloading (see UST Site Plan), it is possible that the presence of solvent materials is likely due to transfer practices from the tank to the transport vehicle. The

tanks themselves are not believed to be a source of release as Ford has tested the intersitional zones of tanks #1 and #2 by volume and found no evidence of leakage. Daily recording of tank levels also indicates that no leakage has occurred.

MN-COMP 0044635

3.0 SUMMARY OF REMEDIATION TECHNOLOGIES

Table 3.1 summarizes technologies which will be considered and identifies the technologies which may be used in the development of remedial alternatives.

Based on information obtained during the RI, determination will be made as to the need for and type of treatability studies to be conducted. The studies will consider appropriate treatment technology for the Site from the list provided on Table 3.1.

MN-COMP 0044636

TABLE 3.1

SUMMARY OF REMEDIAL ACTION TECHNOLOGIES
FORD RI/FS WORK PLAN

Remedial Action Technology	Comments
A. *Soil Remediation*	
A.1 - Deed Restriction	Restricts future land use of area affected by contamination.
A.2 - Site Cap or Cover	Reduction of water infiltration, prevents direct contact and exposure of contaminants at the surface.
A.3 - Removal (excavation)	May be cost prohibitive but removes source of contamination.
A.4 - Consolidation	Permits consolidation of Site materials for other treatment options.
A.5 - Disposal in Industrial Waste/ Hazardous Waste (RCRA) Landfill (On-Site or Off-Site)	Secures waste and minimizes future migration of contaminants, may be restricted by Land Disposal Regulations.
A.6 - Soil Treatment	
- Incineration (On-Site or Off-Site)	Provides destruction of most organic wastes and can be conducted on or off Site. Would require additional handling of decontaminated soil/ash after incineration.
- Advanced Electric Reactor	Practical successes not demonstrated by the manufacturer.
- Bioremediation	Some compounds are not easily biodegradable. VOCs would be released to atmosphere.
- Fixation/Solidification	Limited to fixation of contaminated soil containing inorganics. Could be used to fix residual metals within incinerated soil.
- Soil Washing	Experimental technology. Difficult to maintain oxygen and nutrient levels in soil.
- Soil Vapor Extraction (low temperature soil desorption)	Removes volatile organic waste constituents and promotes biodegradation of non-volatiles.
- Vitrification	Cost prohibitive, not proven technology, will not immobilize VOCs.

MN-COMP 0044637

TABLE 3.1 (CONT'D)

SUMMARY OF REMEDIAL ACTION TECHNOLOGIES
FORD RI/FS WORK PLAN

Remedial Action Technology	Comments
B. *Groundwater Remediation*	
B.1 - Monitoring	Provides determination of ongoing nature, extent and trends.
B.2 - Deed Restriction	Restricts use of groundwater in area of contamination.
B.3 - Cap	Reduction of surface water infiltration potentially reduces long term mass loading to aquifer.
B.4 - Physical Containment	Provides physical barrier to prevent future migration of contaminants.
B.5 - Hydraulic Containment/Collection	
- Extraction Wells	Collects groundwater and mitigates future migration. Would reduce levels of contamination over time.
- Extraction Wells with Reinjection	Reinjection not normally allowed in Minnesota.
- Subsurface Drain	Collects groundwater and prevents future migration. Limited to depths of 40 feet or less.
B.6 Treatment	
- Biological	Difficult to implement and maintain on-Site. Off-Site treatment at Public Owned Treatment Works (POTW) suitable.
- Activated Carbon	Effective in treating large array of organic contaminants. Ineffective for some compounds such as acetone. May require pre or post treatment by other technology.
- Air Stripping	Effective in treating volatile compounds. May require additional polishing by other technology for surface water discharge.
- Aeration	Effective in removal of volatile compounds. Low maintenance where scaling a concern.

MN-COMP 0044638

TABLE 3.1 (CONT'D)

SUMMARY OF REMEDIAL ACTION TECHNOLOGIES
FORD RI/FS WORK PLAN

Remedial Action Technology		Comments
	- Oxidation	High cost of oxidizing agents when used alone. Not effective in treating VOCs without ultraviolet radiation.
	- Ion Exchange	Used to treat inorganic wastewater (i.e. metals).
	- Reverse Osmosis	Used to treat inorganic wastes (i.e. metals.).
	- Solar Evaporation	Would cause VOC releases to atmosphere. Ineffective when humid.
	- Spray Evaporation	Would cause VOC release to atmosphere. Ineffective when humid.
	- Discharge to POTW	Would be subject to POTW's operating permit. Site contaminants are readily treated by POTW.
	- Ultraviolet Oxidation	Capable of treating most organic compounds. Requires pretreatment for iron removal.
	- Biological/Activated Carbon	High cost. Normally applied when high level of organic contaminants present.
B.7	Treatment Groundwater Disposal	
	- Reinjection/Recharge	Not normally allowed in Minnesota.
	- Discharge to Surface Water	Would require NPDES permit and high efficiency treatment.
	- Discharge to POTW	Would be subject to POTW's operating permit.
	- Discharge to RCRA Facility	Logistics of transporting treated water not feasible.
B.8	Alternate Water Supply	Not expected to apply as area serviced by city water system.

MN-COMP 0044639

4.0 SITE INVESTIGATION PLAN

4.1 OBJECTIVES

The goal of this RI/FS is to gather the data necessary to characterize the nature and extent of potential residual contamination resulting from past activities at the Ford Site. The information compiled will be used to:

1) conduct a Baseline Risk Assessment to evaluate potential impact on public health and well being;

2) develop potential remedial alternatives for the Site, if needed;

3) determine what additional data is needed, if any, to fully characterize the site.

The specific tasks to achieve these objectives are:

1) to determine the nature and extent of potential residual soil contamination attributable to past Site activities;

2) to characterize Site geologic conditions;

MN-COMP 0044640

3) to characterize the Site hydrogeologic conditions including horizontal and vertical groundwater flow directions and velocities in both overburden and bedrock;

4) to determine the nature and extent of groundwater contamination in the Site overburden and bedrock, if any;

5) to determine if local surface water is impacted by past Site activities.

4.2 SITE AREA ORGANIZATION

As discussed previously in Section 2.0 (Site Background Information and Past History), four potential source areas have been identified at the Ford Site. Three of these areas, the UST Site, Site A and Site B are located in the main plant area and encompass the majority of the proposed field activities. The scope of field activities at Site C, located adjacent to the Mississippi River, involves the continued monitoring of chemical and hydrogeologic conditions using the existing monitoring well network. Figure 1.2 shows the locations of these potential source areas.

For organizational purposes, a discussion of the scope of work and field activities to be performed at each potential source area will be divided into three sections; the UST Site, Sites A and B (combined), and Site C. The segregation of these potential source areas into separate study units is based

MN-COMP 0044641

on differences in waste disposal history and hydrogeologic setting as outlined in Section 2 and the potential of differing remedial response actions at each source area site.

The following sections discuss the scope of work and field activities which will be performed at each study area.

4.3 UST SITE INVESTIGATION WORK PLAN

4.3.1 Overview of Scope of Work

Based on: the possible presence of waste solvent in the UST Site drain tile system as discussed in Section 2.8; the presence of solvent materials in the soil above tanks #1 and #2; the possible migration of solvent materials outside the UST tank basin, the following scope of work is proposed to investigate Site conditions involving soil and groundwater in the vicinity of the UST.

- Analysis of solvent waste stream in tanks #1 and #2 for metals and further VOC characterization;
- The use of soil gas sampling to investigate soil gas conditions;
- Sample soils for chemical analyses;
- Removal of the four USTs;
- The installation of three groundwater monitoring wells;

MN-COMP 0044642

- Water level monitoring;
- Groundwater sampling of the three new wells and the drain tile sump for metals and VOC.

This work is proposed to evaluate:

- groundwater flow direction,
- hydrogeologic properties,
- assess groundwater quality in the vicinity of the UST;
- assess soil conditions in the vicinity of the UST.

Ford will be removing the four USTs as part of a separate project to relocate the waste solvent storage facility and provide modifications prompted by new federal RCRA UST regulations. As part of this relocation project, Ford will be utilizing two of the four USTs at a new installation to be constructed at the location noted on Figure 4.1. To the extent possible, the sump and drain tile system will be left intact at the existing location to allow for their use in the UST site investigation. Table 4.1 summarizes the scope of field and related monitoring/analytical work proposed.

4.3.2 Soil Gas Survey

A soil gas survey will be conducted to determine soil gas organic vapor concentrations that may indicate the presence of VOC in the soil. Soil gas monitoring will be conducted at approximately 12 locations (i.e. final

CONESTOGA-ROVERS & ASSOCIATES

MN-COMP 0044645

quantity of samples will be determined in the field to obtain an adequate definition) within the unsaturated zone around the UST basin perimeter at a depth of approximately four feet using the following procedure:

1. an augered borehole will be drilled to a depth of approximately 3-1/2 feet into the ground at each test location;

2. a steel gas probe will be driven 1/2 foot through the bottom of the borehole such that the perforated portion of the probe is completely below the bottom of the borehole. A temporary bentonite seal will then be placed at the bottom of the borehole and around the probe;

3. a pump will then be used to draw a soil gas sample out of the probe and into a glass vessel. The flexible tubing leading to (i.e. out of) the glass vessel will than be clamped or valved off to trap the gas sample in the vessel;

4. the tygon tubing leading to the air pump will be removed from the pump and connected to the inlet of the HNu probe. The contents of the glass vessel will then be evaluated using an HNu-tpye photoionization detector with 11.7 EV probe calibrated to benzene to determine relative concentrations of gas present;

5. the borehole will then be backfilled with cuttings;

MN-COMP 0044646

6. as a quality assurance procedure, ambient air (background) readings will be taken prior to and after each sampling location.

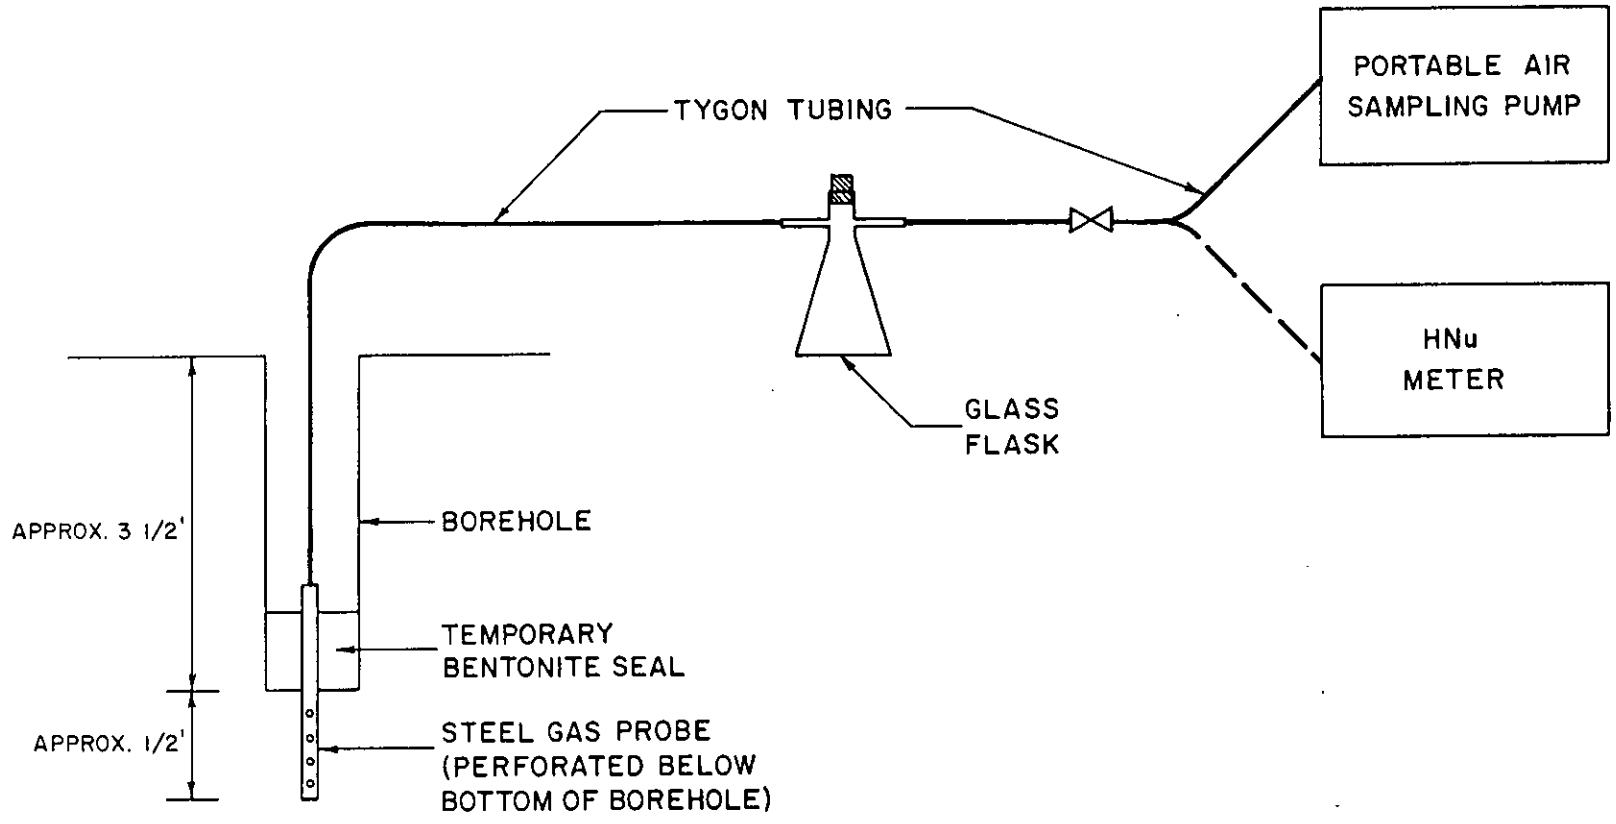
Figure 4.1a presents a schematic of the equipment/method to be used for soil gas evaluation. Where feasible, soil gas monitoring will be conducted within the utility line excavations which radiate from the UST area. The hazard of drilling near the utility lines may, however, prohibit this work at these locations.

The proposed monitoring well location for the UST Site (see Sections 4.3.3 through 4.3.4) will also serve as soil gas sampling locations in order to correlate soil gas field data to laboratory analytical data and evaluate the effectiveness of the soil gas sampling.

4.3.3 Soil Borings/Sampling

Three soil borings will be conducted using hollow stem auger methods. These soil borings will then be completed as monitoring wells. Locations are presented on UST Site Plan and Figure 4.1, and may be modified in the field due to accessibility and the presence of utilities. The borehole will be advanced using a minimum 4-1/4 inch I.D. hollow stem auger. Continuous undisturbed soil samples will be taken by split barrel sampling to define the

MN-COMP 0044647



NOT TO SCALE

MN-COMP 0044648

figure 4.1a
SCHEMATIC OF
SOIL GAS EVALUATION
Ford Motor Company

CRA

2853-7/02/91-M

subsurface soil stratigraphy. All boreholes are expected to be extended a minimum of 2 feet into the water table; the water table is expected to be approximately four to eight feet below grade.

At each monitoring well boring location, continuous undisturbed soil samples will be collected. Sampling will be conducted in accordance with ASTM split barrel sampling methods and EPA SW846 chemical sampling methods. Soil sampling procedures are detailed in Section 6.2.1.

Soil samples will be sent under chain-of-custody procedures and submitted for analysis of VOCs (EPA Method 8010/8020). One sample per boring will be submitted for chemical analysis.

4.3.4 Monitoring Well Installation

Based on Site geologic and hydrogeologic conditions, three monitoring well locations have been selected. The proposed well locations are shown on Figure 4.1 and the UST Site Plan, which is enclosed under separate cover. As described previously, it is expected that groundwater flow direction will be generally towards the southwest. Monitoring wells MWT1 and MWT2 will be placed to intercept groundwater flow downgradient from the UST tank basin. The proposed well MWT3 is located northeast of the UST tank basin for

MN-COMP 0044649

two purposes: to ascertain background groundwater quality and to provide adequate spacing of wells to maximize the evaluation of groundwater flow conditions. These well installations will require a permit from MDH.

The monitoring wells will be constructed according to the procedure provided in Section 6.2.2.

Following installation, the three new wells would be surveyed to the common on-site reference datum (Nation Geodetic Vertical Datum of 1929, NGVD) to establish groundwater elevations.

4.3.5 Groundwater Elevations

Groundwater elevations will be measured to better define the groundwater flow direction under the UST Site. In addition, water levels will be obtained for the drain tile sump and existing monitoring wells placed west of the UST Site as part of the Site B area work. Further information will also be correlated regarding storm water drains in the immediate area to better evaluate their possible influence. Attempt will be made to establish water elevations within these storm sewers should water be present during times of non-precipitation. Storm sewer lines in the area are indicated on Figure 4.1. A minimum of two complete rounds of water levels will be taken and groundwater flow directions will be calculated.

MN-COMP 0044650

4.3.6 Groundwater Sampling

Two rounds of groundwater samples will be collected from the three new groundwater monitoring wells and the drain tile sump. Prior to sampling, each monitoring well will be developed and stabilized as per Section 6.2 and allowed to set for one week prior to sampling.

The groundwater monitoring wells will be developed using a precleaned[1] stainless steel bailer until a silt-free condition exists, or until a maximum of 10 well volumes has been removed. During development pH, specific conductivity and temperature will be recorded as per Section 6.2.

Wells will be sampled one week after well development. Prior to sample collection, the well will be bailed to remove a minimum of three well volumes, or until the well bails dry. The sample from the sump will be obtained as representative as possible by the use of a "coliwasa" column sample method. Samples will be sent under chain-of-custody procedures and analyzed for the following parameters: VOCs and metals as provided in Section 6.0.

Each sampling round will include one duplicate and one field blank sample as a quality control check.

MN-COMP 0044651

[1]Methanol/hexane/methanol followed by distilled water rinse.

4.3.7 Interim Response Action (IRA) Inspection and Sump Sampling Plan

The UST facility will be relocated as earlier noted. This new facility will be operated, maintained and inspected in accordance with applicable UST regulations. Given the more immediate need to address the inspection of the UST Site drain tile and sump, the following IRA is proposed.

4.3.7.1 Pumping Operations

It is proposed that a pump and discharge line be used to pump down the drain tile system. The discharge would be routed to the two filtering basins used for process water recycling/setting with a total capacity of 1.5 million gallons located beneath the paint building. A fiberglass pipeline to the building exists and will be utilized.

Hook up of the line would include use of a pump within the manhole and back flow prevention on the discharge line. A schematic of the discharge/pump out system is presented on the UST Plan.

In addition, diversion of storm water runoff will be evaluated to prohibit runoff from areas adjacent to the UST tank basin from flowing to the basin area.

MN-COMP 0044652

It is proposed that regardless of removal of the USTs, the flow to the sump should be sampled and analyzed every two months during the

RI to evaluate the water quality. This material is likely to contain the same constituents as the wastewater from paint spray booths. As a result, it is not necessary to evaluate water quality each time pumping is conducted. The sample for analysis will be drained from the discharge line via a sampling port (to be installed). To provide the most representative sample, a composite will be made by taking a sample at the beginning, middle and end of the pumping cycle. This will be done by manually operating the pump and observing the operation during the entire cycle. The collected sample will be analyzed for VOCs and metals as provided in Section 6.0. These pumping operations will be implemented for the period of the RI field work, after which they will be reevaluated. A key factor in this will be whether the sump and drain tile system are still present after the tank removal.

4.3.7.2 Sump Inspection

Assuming the sump and drain tile will be left in place, they will be inspected on a monthly basis and after significant precipitation events. The pumping system will be started to lower the liquid level in the manhole and drain tile system for inspection. The manhole area will then be visually inspected from surface level (without confined space entry) using a strong light. The inspection will help identify:

- sump water levels,
- presence of potential solvent waste in sump water,

MN-COMP 0044653

- sediment buildup in sump,
- evidence of pipe blockage.

A reference elevation at the lip of the manhole will be established to allow measurement of the water elevation with the manhole sump and the elevation of any sediment build up which may be present.

Inspections of the facility will be conducted on at least a monthly basis during the RI field work. After the RI field work, the frequency of inspection will be reassessed. The results of each inspection will be recorded on an inspection log sheet. Information on the log sheets will include the inspector's name and title, date and time of inspection, item of inspection, observations, the date and whether pumping occurred during inspection.

An inspection log will be kept with the RI/FS project files. Records of inspections will be kept under the terms of the records retention policy provided in Section 7.2.

4.3.8 Reporting

The final UST Site report will be included in the final RI report and present the following information:

1. Background of the Site,
2 Tank contents and history,

MN-COMP 0044654

3. Results of all sampling and monitoring conducted, including inspection logs completed to date,
4. Site map showing all sampling locations (i.e. borings, monitoring wells, etc.),
5. Technical information on geology and hydrogeology of the Site area,
6. Technical information on surface waters runoff of the area, if any,
7. Building information on structures near the Site area,
8. Information and locations of utilities in the area,
9. Information on any free product or vapors,
10. Interim control measures proposed underway and/or completed,
11. Technical discussion, conclusions and recommendations, and
12. All associated sampling and analytical protocols.

Following completion of the report, the need for additional interim response action will be assessed.

4.4 SITES A AND B INVESTIGATION

Due to the proximity, similar waste disposal history and anticipated similar hydrogeologic setting, Sites A and B will be investigated under simultaneous programs of work.

MN-COMP 0044655

4.4.1 Overview of Scope of Work

Based on the history of potential waste disposal at Sites A and B and the detection of contaminated soil and groundwater at Site B as outlined in Section 2.0, the following scope of work is proposed to characterize soil and groundwater chemical conditions and hydrogeologic conditions at Sites A and B:

1. installation of boreholes to obtain soil samples for chemical and hydrogeologic analysis;
2. installation of overburden monitoring wells in selected soil boreholes;
3. installation of bedrock monitoring wells, collecting bedrock core;
4. collection of groundwater chemical data from monitoring wells;
5. collection of hydrogeologic data from monitoring wells;
6. collection of chemical data from surface water.

The following subsections detail the field activities associated with the above tasks. Table 4.1 summarizes the scope of field and related monitoring/analytical work proposed. Site A is considered to be entirely on Ford property. The scope of work for the investigation of Site B is separated into two sections, one for work to be performed on Ford property and one for work to be performed on Soo Line property.

MN-COMP 0044656

Performance of the work proposed for the Soo Line property is contingent on Ford receiving access authorization from Soo Line. Ford will request MPCA assistance if efforts to obtain access are unsuccessful.

4.4.2 Soil Sample Collection

Soil samples will be collected to determine the extent and chemical characteristics of potentially contaminated soils and to obtain data for hydrogeologic interpretation. Samples will be collected for chemical analysis and geological classification continuously from the surface to the top of bedrock, expected to be from 10 to 15 feet BGS. One sample per boring will be submitted for chemical analysis. Details pertaining to the QA, analytical parameters, field protocols and field methods that will be used are described in Section 6.0 (QAPP).

Ford Property

A minimum of 13 boreholes will be advanced at Sites A and B on Ford property. Borehole depths are expected to be from 10 to 15 feet BGS. Figure 4.1 shows the locations of these boreholes. Two of the borings will be completed as monitoring wells.

MN-COMP 0044657

The objective of this soil sampling program is to delineate the extent of potentially contaminated soils. Borehole locations were chosen based on our review of past work and historical aerial photographs which show areas of disturbance.

The objectives for soil sample locations chosen at Site B were to further delineate the extent of previously encountered contamination in BH A, BH B and MW-1. The proposed borings will be advanced to delineate the areal extent of potential contamination. Soil boring locations chosen at Site A are intended to provide adequate coverage of the disturbed area as shown in the 1985 aerial photograph. Site A is considered to be entirely on Ford property.

Soo Line Property

A minimum of 10 boreholes will be advanced at Site B on Soo Line property. Borehole depths are expected to be from 10 to 15 feet BGS. Figure 4.1 shows the locations of these boreholes. Two of the borings will be completed as monitoring wells

The objective of the Soo Line soil sampling program is to delineate the extent of potentially contaminated soils. Borehole locations were chosen based on our review of past work and historical aerial photographs which show areas of disturbance.

MN-COMP 0044658

4.4.3 Overburden Monitoring Well Installations

4.4.3.1 Site A Wells

Three overburden monitoring wells will be installed at Site A on Ford property if soil contamination is discovered at Site A. The locations of these potential wells will be based on soil chemistry and geologic data obtained during the soils investigation phase of the Site A area. These monitoring wells will be placed to provide a thorough coverage of the Site A area shallow groundwater to intercept potentially impacted groundwater, if any, associated with contaminated soils.

Overburden monitoring well construction methods and field protocols are detailed in Section 6.2.2.

4.4.3.2 Site B Wells

Overburden monitoring wells will be installed to characterize the chemical and hydrogeologic conditions of the shallow groundwater underlying Site B.

MN-COMP 0044659

Monitoring well placement will be based on both available data gathered from past studies and additional data gathered during the soils investigation. Figure 4.1 shows the approximate locations of the proposed monitoring wells.

Ford Property - Site B Wells

Based on the chemical and hydrogeologic data available from the existing Site B monitoring wells (MW-1, MW-2 and MW-3), two overburden monitoring well locations, on Ford property, were selected . The objectives of these new well locations is to further delineate the location of potential groundwater contamination which may extend laterally to the east of MW-1 and downgradient to the north of MW-1 and MW-2. Additionally, these wells will provide added data points for hydrogeologic interpretation. These wells will be installed in the soil borings previously noted.

Soo Line Property - Site B Wells

A minimum of two overburden monitoring wells will be installed at Site B on Soo Line property. These wells will be installed in the previously completed borings as earlier noted. These wells are intended to delineate the source of potential groundwater contamination upgradient of MW-1 and MW-2. The locations of these wells and the locations of possible additional wells are contingent on the results of the borehole sampling program.

MN-COMP 0044660

4.4.4 Bedrock Monitoring Wells

Three bedrock monitoring wells will be installed at Site B to ascertain if groundwater contamination detected at Site B has migrated vertically into the bedrock, determine if a hydraulic connection exists between the overburden and bedrock and determine horizontal and vertical groundwater flow characteristics of the bedrock aquifer. Bedrock monitoring wells will be located adjacent to selected overburden monitoring wells (nested) to provide determination of vertical hydraulic gradients. Two bedrock wells will be installed on Ford property and one bedrock well will be installed on Soo Line property. Figure 4.1 shows the proposed locations of the bedrock monitoring wells.

Bedrock monitoring well locations were chosen based on the observation of impact to the overburden units at Site B. Well placement will maximize interpretation of hydrogeologic characteristics.

The bedrock immediately underlying the Sites A and B area consists of limestone of the Platteville Formation. Based on past field observations and available literature, groundwater is known to occur in fractures of the Platteville Formation. The thickness of the Platteville is estimated at 20 to 25 feet in the Site area.

Underlying the Platteville Formation is the Glenwood Shale which is approximately 4 to 6 feet thick. Literature sources state that this

MN-COMP 0044661

Formation is composed of clay rich, thin bedded shales which functions as a hydrogeologic confining unit. Underlying the Glenwood Shale is the St. Peter Sandstone.

Based on the above information, the proposed bedrock monitoring wells will be installed with the well screens set in the Platteville Formation. Drill holes will not extend beyond the contact with the Glenwood Shale. It is expected that the Glenwood Shale will provide an effective confining layer preventing vertical groundwater flow into the St. Peter Formation.

Bedrock monitoring wells will be installed to minimize potential cross contamination from the overburden aquifer to the bedrock aquifer. The following outline details the procedures and materials which will be used to install the bedrock monitoring wells:

1. A 10 inch diameter borehole will be advanced through the overburden, two feet into the top of the Platteville Formation;

2. A 6.0 inch diameter steel casing will be installed, sealed and grouted in the 10 inch boring. The casing will be allowed to set an adequate period of time, and then will be checked to ensure an adequate seal has been achieved. This check will be done by placing drilling water in the casing and observing that the water level is maintained;

MN-COMP 0044662

3. Using wet rotary methods, a core hole will be advanced using an nx sized barrel (approximately 2.0 inch inside diameter) to the top of the Glenwood Shale. All wet rotary methods will be conducted using potable city water.

4. The core hole will be reamed to a diameter of 6.0 inches using a tri-cone rotary bit and wet rotary methods.

5. The drill hole will be flushed clean using potable water.

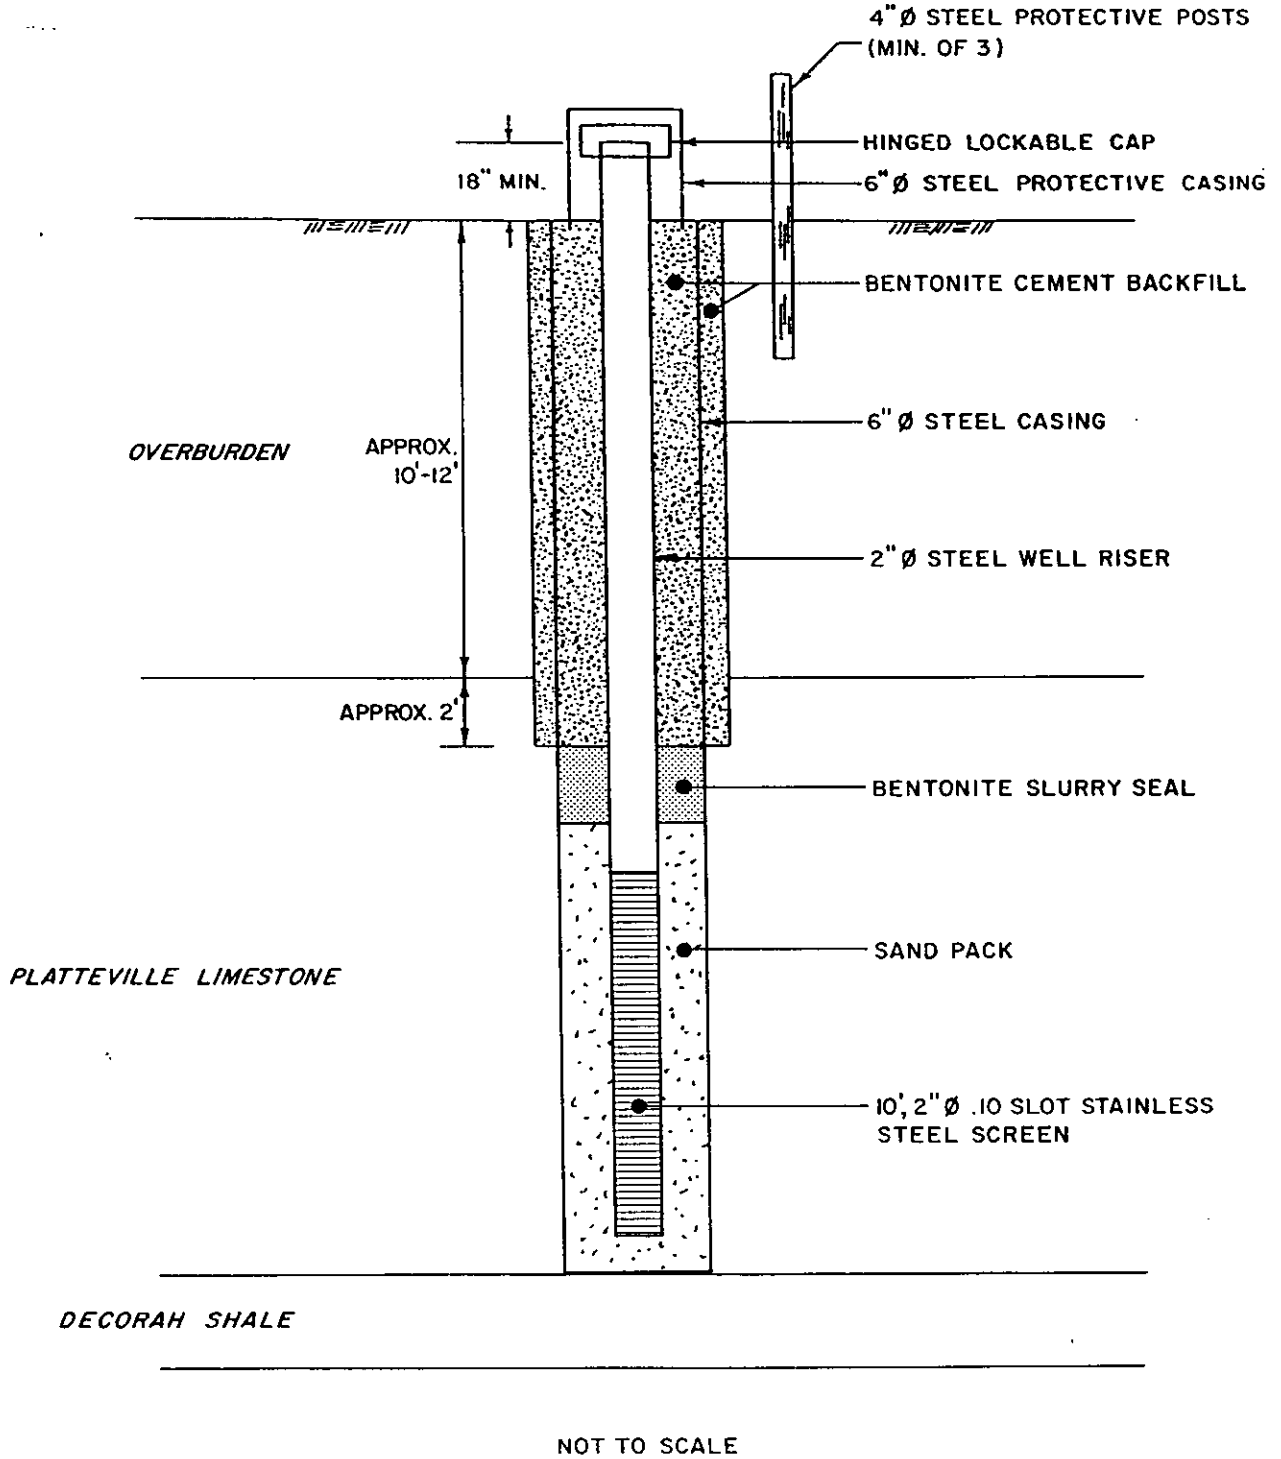
6. A two inch diameter well and surface protection will be installed using the same materials, methods and field protocols as described in Section 6.2.2.

7. All drilling equipment (i.e. rods, augers, drill rig, etc.) will be cleaned in accordance with the procedures outlined in Section 6.2.2.

Figure 4.2 details the bedrock monitoring well installations.

Bedrock monitoring wells will be installed in accordance with the MDH well code using a licensed well contractor.

Rock core will be cataloged and described by CRA's field geologist, paying particular attention to hydrogeologic properties of the bedrock.



NOT TO SCALE

MN-COMP 0044664

figure 4.2

TYPICAL BEDROCK MONITORING WELL INSTALLATION

Ford Motor Company

CRA

2853-8/02/90-M

All monitoring wells will be developed and stabilized as described in Section 6.2.2.

4.4.5 Groundwater Sampling

Following well development and stabilization, two rounds of groundwater samples will be collected from overburden and bedrock wells. Details pertaining to sampling procedures, analytical parameters, field procedures, sampling protocols, quality assurance and quality control are summarized in Section 6.0 (QAPP).

4.4.6 Hydrogeologic Data Collection

Hydrogeologic data will be collected from selected monitoring wells to provide a basis for determining groundwater flow direction in overburden and bedrock, horizontal and vertical hydraulic gradients, hydraulic conductivities, groundwater flow rates and groundwater recharge and discharge points. Monitoring well reference elevations will be surveyed to the NGVD datum to aid in hydrogeologic characterization.

The following hydrogeologic data collection is proposed:

MN-COMP 0044665

1. Water Level Elevations: Three rounds of water elevation data will be collected from all wells using an electric water level tape.

2. Single Well Response Tests: Single well response tests will be performed on selected monitoring wells to provide data for interpreting hydraulic conductivity. Rising and falling head tests will be conducted using a "slug" consisting of a solid PVC rod. The slug will be inserted into the monitoring well, resulting in a raising of the water level. Water level change versus time will be recorded using an electric water level tape as the water level column drops back to its static level (falling head test). Should the hydraulic response be too rapid to accurately monitor by electric water level tape, an electronic transducer and data logger will be used. Upon stabilization of the water level to static conditions, the slug will be removed, causing a lowering of the water level. Water level measurements versus time will again be noted as the water rises to its static position (rising head test). Response test data will be interpreted using the method of Papadopulos 1973, with the aid of a computer program, Graphical Well Analysis Package (GWAP).

4.4.7 Surface Water Sampling

Three surface water samples will be collected to aid in evaluating the potential impact of past Site disposal practices on local surface

MN-COMP 0044666

water. These samples will be taken in conjunction with the two proposed groundwater sampling events using the same analytical parameters as discussed in Section 6.0.

The locations of these sample points is illustrated on Figure 4.3. One surface water sample will be collected from Hidden Falls creek, directly from the storm sewer runoff (SW-2). This location will be used to evaluate if Site groundwater is discharging to the area storm sewer system. Two surface water samples will be collected from the Mississippi River, one located down gradient of the Site (SW-3) and one located up gradient of the Site (SW-1) to provide background chemical characterization.

Surface water sampling procedures, QA and field protocols are discussed in Section 6.0.

4.5 SITE C INVESTIGATION

4.5.1 Overview of Scope of Work

As detailed in Section 2.0, an investigation of Site C has been ongoing for approximately nine years. There are presently four monitoring wells installed at Site C, with a significant amount of chemical and hydrogeologic data collected from these wells, and from surface water. The summary of the evaluation of Site C is provided in Section 2.7.

MN-COMP 0044667

MN-COMP 0044669

5.0 PROJECT ORGANIZATION AND RESPONSIBILITY

Conestoga-Rovers and Associates (CRA), as contractor to Ford, has overall responsibility for all phases of the RI/FS. CRA will perform or supervise all field investigations and, using information compiled from this program, perform a site and risk assessment. In addition, CRA will also develop, screen and evaluate remedial action alternatives. All reports based on RI/FS activities will be produced by CRA.

Pace Laboratories Inc., as analytical subcontractor to CRA, will perform all chemical analyses of samples collected for the RI.

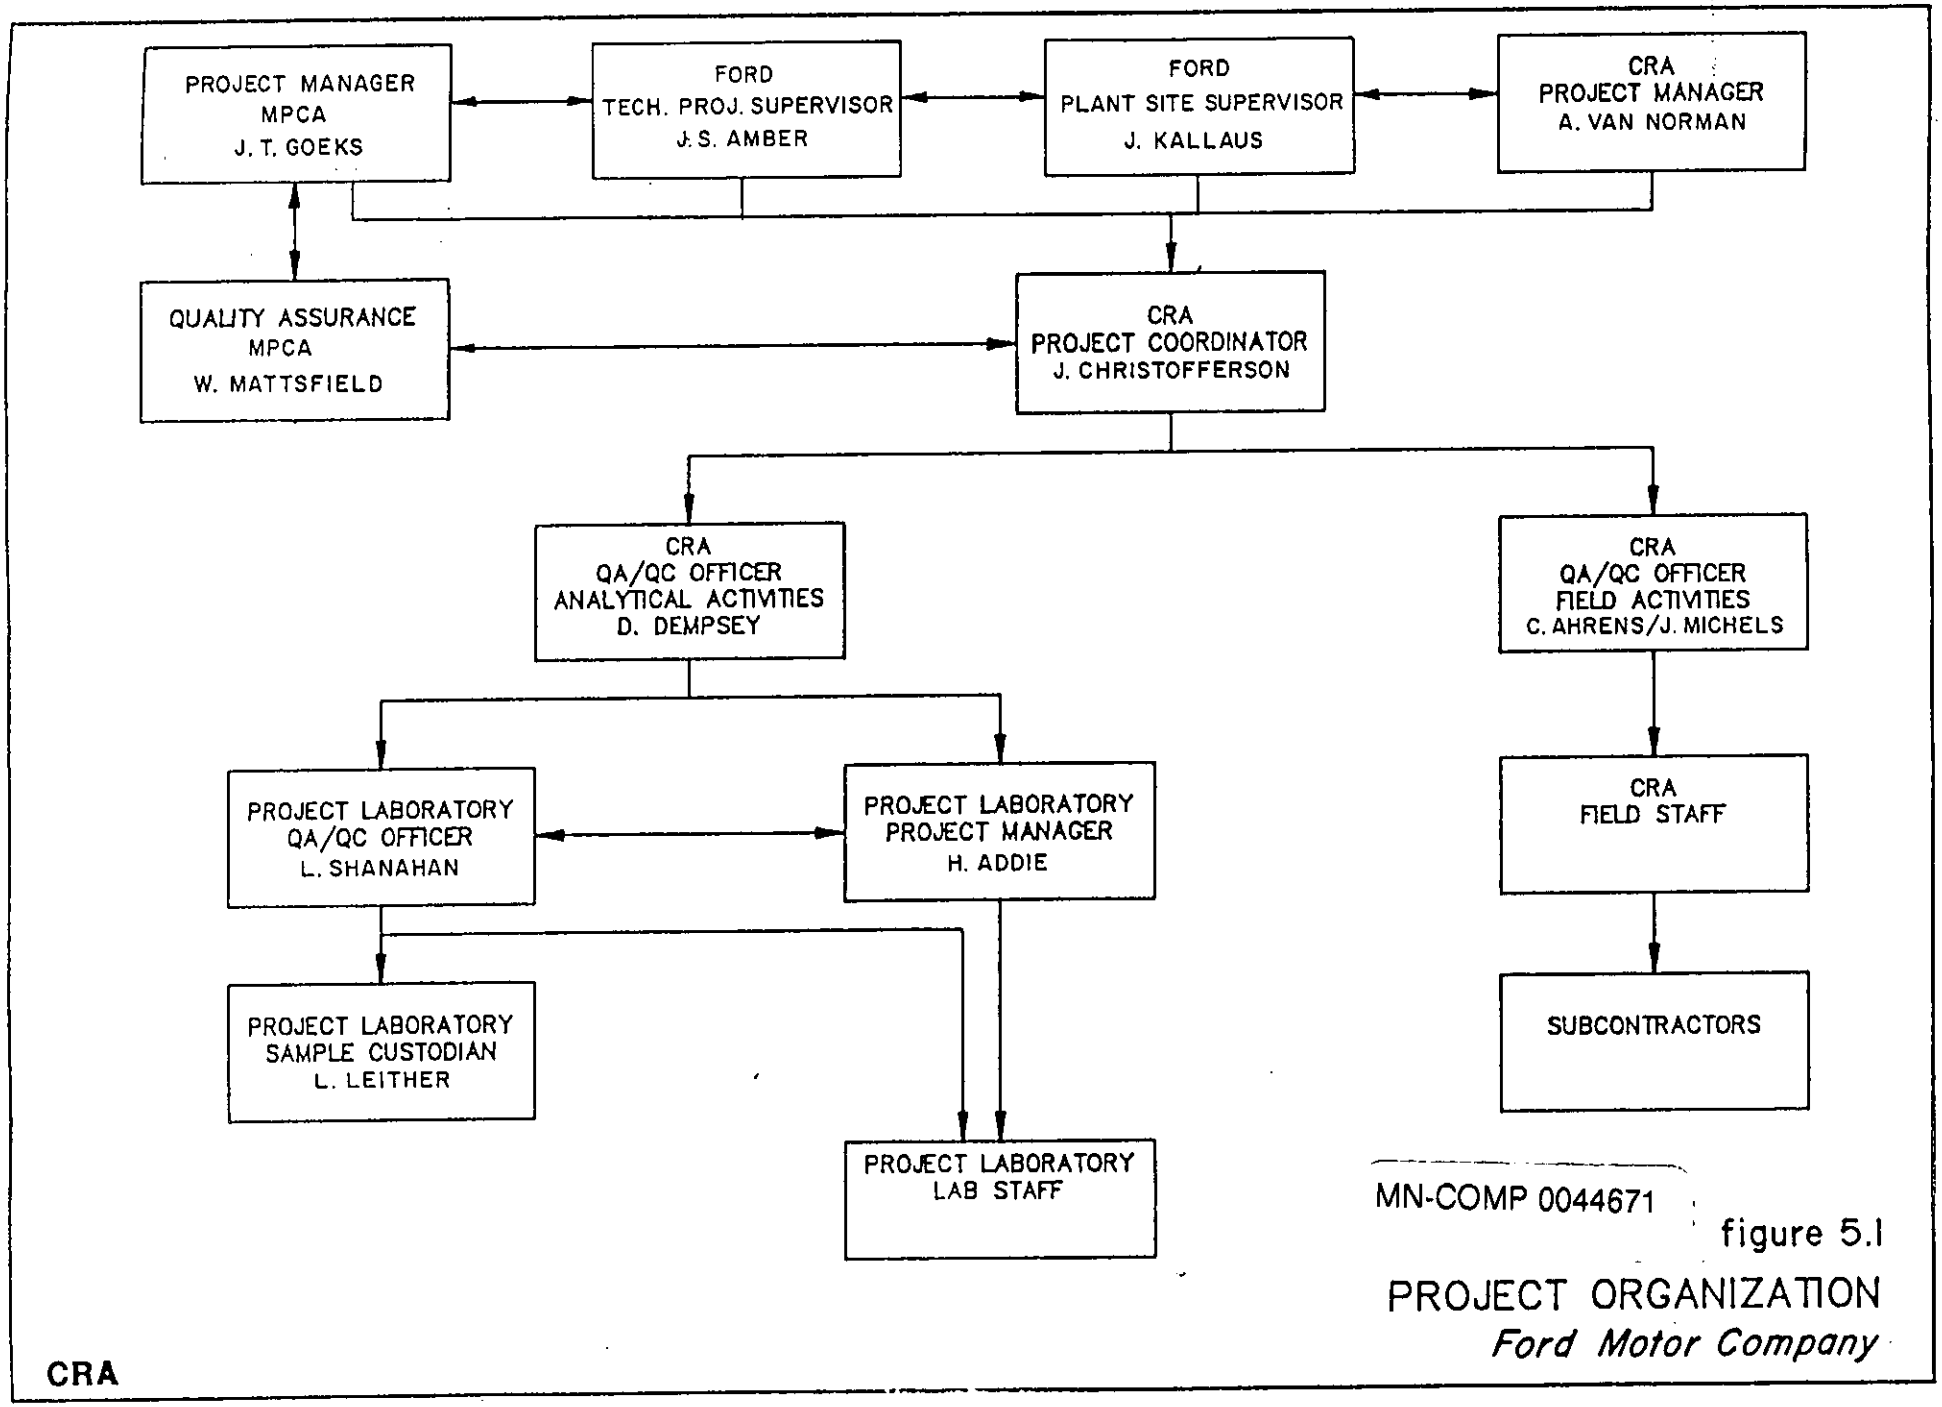
Both firms will provide project management as appropriate to their responsibilities. CRA will provide administrative oversight and QA/QC for all deliverables. All final project deliverables will be issued by CRA.

Figure 5.1 presents the key staff organization for the project. A summary of each of the key person's responsibilities is presented below:

Jerome S. Amber - Technical Project Supervisor, Ford

- General overview of the project to ensure that the objectives are met
- Participation in negotiations with the MPCA
- Managerial guidance to CRA's Corporate Project Manager and Project Coordinator

MN-COMP 0044670



MN-COMP 0044671

figure 5.1

PROJECT ORGANIZATION

Ford Motor Company

CRA

2853-20/08/90-M

John Kallaus - Ford Site Supervisor, Ford

- Provides coordination with Plant personnel and operations
- Provides access to necessary Plant facilities
- Coordinates activities with Plant security

Alan Van Norman - Project Manager and Principal Engineer, CRA

- Provides overall project management
- Ensures all resources of CRA are available on an as-required basis
- Participation in technical negotiations with the MPCA and attendance at project meetings on an as-required basis
- Managerial and technical guidance to CRA staff
- Preparation and review of RI/FS report
- Approval of the QAPP

Jon Christofferson - Project Coordinator, CRA

- Day-to-day project management
- Managerial and technical guidance to CRA staff
- Participation in technical negotiations with the MPCA
- Preparation and review of RI/FS report
- Project file custodian

Dave Dempsey - Quality Assurance Officer - Analytical Activities, CRA

- Overview of laboratory activities
- Decides laboratory data corrective action
- Analytical data assessment and validation

MN-COMP 0044672

- Responsible for external performance and system audits
- Review of RI/FS report
- Approval of the QAPP

Chuck Ahrens/Jon Michels - Quality Assurance Officers - Field Activities/Field Supervisors, CRA

- Management of field activities and field QA/QC
- Data assessment
- Preparation and review of RI/FS report
- Technical representation of field activities
- Preparation of SOP for field activities

Helen Addie - Project Manager, Pace

- Ensures all resources of Pace are available on an as-required basis
- Overviews final analytical report
- Oversees all laboratory's activities
- Approval of the QAPP

Bill Scruton - Operations Manager, Pace

- Coordinate laboratory analyses
- Supervise in-house chain-of-custody
- Schedule sample analyses
- Oversee data review
- Oversee preparation of analytical reports
- Approve final analytical reports prior to submission to CRA

MN-COMP 0044673

Leisa Shanahan - Quality Assurance Officer, Pace - Laboratory Activities

- Overview laboratory quality assurance
- Overview QA/QC documentation
- Conduct detailed data review
- Decide laboratory corrective actions, if required
- Technical representation of laboratory QA procedures
- Approval of the QAPP

Lisa Leither - Sample Custodian, Pace

- Receive and inspect the incoming sample containers
- Record the condition of the incoming sample containers
- Sign appropriate documents
- Verify chain-of-custody and its correctness
- Notify laboratory manager and laboratory supervisor of sample receipt and inspection
- Assign a unique identification number and customer number and enter each into the sample receiving log
- With the help of the laboratory manager, initiate transfer of the samples to appropriate lab sections
- Control and monitor access/storage of samples and extracts

Primary responsibility for project quality rests with CRA's QA Officers. Ultimate responsibility for project quality rests with CRA's Project

MN-COMP 0044674

Manager. Independent quality assurance will be provided by the Laboratory Project Manager and QA Officer prior to release of all data to CRA.

5.1 MINNESOTA POLLUTION CONTROL AGENCY (MPCA)

The MPCA Project Manager will be responsible for the execution and direct management of all the technical and administrative aspects of this project. The MPCA Project Manager will also be responsible for providing approval of the work plan. J. Todd Goeks is the Project Manager for the MPCA.

The MPCA Quality Assurance Officer will be responsible for MPCA oversight of QA/QC activities and approval of the QAPP. The MPCA Quality Assurance Officer will be Wayne Mattsfield.

MN-COMP 0044675

6.0 QUALITY ASSURANCE PROJECT PLAN (QAPP)

6.1 QUALITY ASSURANCE (QA) OBJECTIVES FOR MEASUREMENT DATA

The overall QA objective is to develop and implement procedures for field sampling, chain-of-custody, laboratory analyses and reporting that will provide accurate data. Specific procedures to be used for sampling, chain-of-custody, calibration, laboratory analysis, reporting, quality control, audits, preventive maintenance and corrective actions are presented in other sections of this QAPP.

Data quality objectives (DQO) have been established in accordance with the U.S. EPA guidance document entitled "Data Quality Objectives for Remedial Response Activities", EPA/540/G-87/003, March 1987, to ensure that the database developed during the Site investigation meets the objectives and quality necessary for its intended use, namely risk assessments, determining contaminant distribution and evaluating remedial objectives.

DQO can be classified for measurement data by defining the level of analytical support assigned to each type of measurement data. For activities outlined in Table 4.1, all laboratory analyses will require level III analytical support.

DQO for field screening activities such as the determination of pH, specific conductance, temperature and VOC concentration (HNu) will require level I analytical support.

MN-COMP 0044676

6.0 QUALITY ASSURANCE PROJECT PLAN (QAPP)

6.1 QUALITY ASSURANCE (QA) OBJECTIVES FOR MEASUREMENT DATA

The overall QA objective is to develop and implement procedures for field sampling, chain-of-custody, laboratory analyses and reporting that will provide accurate data. Specific procedures to be used for sampling, chain-of-custody, calibration, laboratory analysis, reporting, quality control, audits, preventive maintenance and corrective actions are presented in other sections of this QAPP.

Data quality objectives (DQO) have been established in accordance with the U.S. EPA guidance document entitled "Data Quality Objectives for Remedial Response Activities", EPA/540/G-87/003, March 1987, to ensure that the database developed during the Site investigation meets the objectives and quality necessary for its intended use, namely risk assessments, determining contaminant distribution and evaluating remedial objectives.

DQO can be classified for measurement data by defining the level of analytical support assigned to each type of measurement data. In general, all laboratory analyses will require level III analytical support.

DQO for field screening activities such as the determination of pH, specific conductance, temperature and VOC concentration (HNu) will require level I analytical support.

MN-COMP 0044677

The use of the analytical support levels defined above will ensure that the overall objectives for the RI/FS will be completed.

6.1.1 Level of QA Effort

To assess the quality of data resulting from the field sampling program, field duplicate samples, rinsate samples, trip blank samples and matrix spike samples will be taken (where appropriate) and submitted to the analytical laboratory.

For all field samples collected, field duplicate samples will be collected at a frequency of 1 per 10 or fewer investigative samples per parameter set for each sample matrix or at least once per day, whichever is more frequent. Matrix spike/matrix spike duplicate (MS/MSD) samples will be analyzed at a minimum frequency of 1 in 20 for each analysis.

Rinsate blank samples will be submitted at a frequency of 1 per 10 or fewer well purging/sampling equipment cleanings or at least once per day of well purging/sampling equipment cleanings. Rinsate blanks shall be collected by routing deionized distilled water through decontaminated sampling equipment. For surface water samples, field blank samples will be collected at a frequency of 1 per 10 samples in place of rinsate samples.

Trip blank samples for VOC analyses (prepared by the laboratory and consisting of organic-free water) will be shipped by the

MN-COMP 0044678

laboratory with each shipment container of aqueous VOC sample vials. Trip blanks samples will be handled in a manner consistent with actual field sample handling and will be shipped back to the laboratory with the daily field samples. The trip blanks will provide a measure of potential cross contamination of samples during shipment and handling. It is noted that trip blanks will not be opened in the field.

The sampling and analysis program (the level of QA effort required for each matrix) is summarized on Table 6.1.

Blank samples will be analyzed to check procedural contamination and/or ambient conditions and/or sample container contamination at the Site that may cause sample contamination.

Upon examination of the results obtained by Pace, if any of the aforementioned blanks contain any analytes, the following procedure will be followed. First, determine if the contamination is real by examining the associated investigative samples and method blanks. If the contamination can be traced to an isolated source, e.g. a highly contaminated sample, the data are to remain unqualified. Otherwise, the data will be examined to determine the extent of contamination and all associated data will be qualified according to the data validation guidelines referenced in Section 6.6.

Field duplicate samples will be analyzed to check for sampling and analytical reproducibility. Field duplicate samples will be collected 1 for every 10 samples per matrix or at least once each day of sampling

MN-COMP 0044679

TABLE 6.1

SUMMARY OF QA SAMPLES FOR SAMPLES
COLLECTED DURING TWIN CITIES ASSEMBLY PLANT RI/FS
FORD MOTOR COMPANY

Matrix	Rinsate Sample	Field Duplicate Sample	MS/MSD Sample	Trip Blank Sample
Soil	1 for every 10 samples or at least once per day of sampling activities	1 for every 10 samples or at least once per day of sampling activities	1 for every 20 samples	
Groundwater	1 for every 10 samples or at least once per day of sampling activities	1 for every 10 samples or at least once per day of sampling activities	1 for every 20 samples	1 in every cooler containing aqueous VOC samples
Surface Water[1]	1 for every 10 samples or at least once per day of sampling activities	1 for every 10 samples or at least once per day of sampling activities	1 for every 20 samples	1 in every cooler containing aqueous VOC samples

Note:

1. For surface water, field blank samples will be collected in place of rinsate samples.

MN-COMP 0044680

activities for each matrix. Comparison of field duplicate samples will be based upon analytes, both non-detected and detected, and relative percent differences (RPD). The parameters which do not meet criteria may only be used for qualitative assessment. Professional judgement shall determine the RPD limits on a sample-to-sample basis.

6.1.2 Sensitivity, Precision and Accuracy of Analysis

The fundamental QA objective with respect to the accuracy, precision and sensitivity of analytical data is to achieve the QC acceptance criteria of each analytical protocol. The sensitivities required for these organic analyses will be at least the targeted detection limits listed on Tables 6.2 and 6.3. These tables present targeted detection limits for all target parameters. It should be noted that these limits are targeted detection limits. Lower method detection limits, if achieved by the laboratory, will be substituted for the targeted detection limits in the final report.

The analytical method precision (based upon relative percent difference) shall be determined from replicate analyses, and will meet criteria presented in Section 6.6.2.2.

MN-COMP 0044681

TABLE 6.2

PRACTICAL QUANTITATION LIMITS (PQLs) AND METHOD DETECTION LIMITS (MDLs) FOR VOC ANALYSES TWIN CITIES ASSEMBLY PLAN SITE RI/FS FORD MOTOR COMPANY[1]

1. PQLs and MDLs are highly matrix depenent. Therefore, actual PQL and MDL obtained may be considerably higher, depending on the sample matrix.
2. PQLs and MDLs are based on wet weight of sample.

MN-COMP 0044683

Accuracy for the analytical method will be determined by the matrix spike and check sample recoveries. Sections 6.6.2 summarize criteria that each spike recovery must meet.

6.1.3 Completeness, Representativeness and Comparability

It is expected that all analyses conducted in accordance with SW-846 methods will provide data meeting QC acceptance criteria for 80 percent of all samples tested. Any reasons for variances will be documented. The corrective actions taken if the completeness goals are not met are described in Section 6.11 of this work plan.

The sampling networks have been designed to provide data representative of Site conditions. During development of these networks, consideration was given to past disposal practices, existing data from past studies completed for the Site, remedial activities to date and physical setting. The extent to which existing and planned analytical data will be comparable depends on the similarity of sampling and analytical methods. The procedures used to obtain the planned analytical data are documented in this work plan. However, it may be necessary to verify similar documentation for previous analytical data to adequately establish comparability. Comparability of

MN-COMP 0044684

laboratory analyses will be ensured by the use of consistent units. Following completion of data collection, the existing database will be evaluated for representativeness.

6.2 FIELD PROTOCOLS

6.2.1 Soil Sample Collection

All soil samples will be obtained in accordance with ASTM D1586-84. The split spoon sampler will be attached to the drill rod and driven into the soil the full depth (24 inches). If the soil is loose, wet or in any way unconsolidated, clean basket retainers will be used to retain the soil in the split spoon. Between each sampling station, the split spoon will be cleaned with Alconox detergent and rinsed with deionized water.

All soil samples collected will be described and classified according to the Unified Soil Classification System. A record of all soil sampling will be recorded on borehole logs which will be maintained by the Site geologist.

Selected soil samples will be prepared in the following manner for chemical analyses.

MN-COMP 0044685

1. The sampling tool and all other instruments used in extracting the soil samples for chemical analyses will be precleaned using Alconox detergent. A new pair of disposable latex gloves will be used for each sample handled. Disposable gloves will be collected and contained for proper disposal.

2. Each soil sample for chemical analyses will be obtained and prepared in the following manner:

   a. Using a clean cutting tool (stainless steel knife), the soil sample will be extracted from the split spoon, attempting to ensure that a representative sample is collected. For VOC samples, the sample core will be transferred to sample jars without breaking apart the core, if possible. The remaining soil will be placed in the proper sampling bottles as outlined on Table 6.4.

3. Soil samples will be labeled noting the sampling location, depth, time and sampler's initials. A separate hard-cover field book will be maintained to document all soil samples and sampling events.

4. Samples will be placed on ice or cooler packs in laboratory supplied coolers after collection and labeling.

The criteria for selecting soil samples for chemical analysis are as follows:

MN-COMP 0044686

TABLE 6.4

SOIL AND GROUNDWATER CONTAINER, PRESERVATION, HOLDING TIME PERIODS AND SHIPPING REQUIREMENTS

Analysis	Containers	Preservation	Maximum Holding Times[1]	Volume of Sample	Shipping[2]	Normal Packaging[3]
Water						
VOCs	Two 40 ml volatile organic vials	HCl to pH<2 4°C	14 days	Fill completely, no air bubbles	Courier or staff	Bubble Pack
Metals	One 500 ml polyethylene	HNO_3 to pH<2 4°C	6 months (except mercury, 28 days)	Fill to shoulder of bottle	Courier or staff	Bubble Pack
Soil						
VOC	1 4 oz. glass jar	4°C	14 days	Fill completely	Courier or staff	Bubble Pack
Metals	1 4 oz. plastic jar	4°C	6 months (except mercury, 28 days)	Fill completely	Courier or staff	Bubble Pack

Notes:

1. The maximum sample holding time is calculated from the date of sample collection.
2. Samples will be picked up by Pace.
3. All samples shall be protected from light.

MN-COMP 0044687

During sampling, HNu headspace readings will be taken and recorded as an indication of possible VOC presence. Headspace readings will be collected as follows: a portion of the soil sample not already sealed in VOC jars (i.e. the metals sample) will be placed in a glass jar and the mouth of the jar will be sealed with aluminum foil. After a period of 15 to 20 minutes, an HNu photoionization probe will puncture the seal to detect any volatile gases that may be emitting from the soil.

If an HNu reading above site background levels is recorded from the soil sample, the sample will be prepared for possible analysis. A representative sample from each boring will be selected for chemical analysis after the HNu screening is complete. If HNu readings above background are not recorded, the soil sample collected from just above the groundwater table will be submitted for chemical analysis. A minimum of one soil sample per boring location will be submitted for chemical analysis.

6.2.2 Overburden Monitoring Well Installation Protocols

Overburden monitoring wells will be installed using a truck mounted drill rig advancing hollow stem augers with a minimum inside diameter of 4-1/4 inches. Overburden monitoring wells will be 2 inches in diameter. The following well materials will be used:

1. 2.0 feet or 5.0 feet of .10 slot stainless steel screen;
2. low carbon steel, flush threaded riser;

3. appropriate sized sand pack material installed a minimum of 1.0 feet above the top of the well screen;
4. a seal consisting of a minimum of 2.0 feet of bentonite slurry
5. bentonite (approximately 3 percent) cement backfill;
6. surface protection consisting of a locking steel protective post and three protective bumper posts.

The decision to use a 2 foot or 5 foot screen will be made in the field based on the depth of the borehole and the depth to the water table. As a provision for the possible presence of light NAPL, wherever possible, the screen will be installed so that the top of the screen is above the water table.

The monitoring well will be installed inside the auger annulus by backing the augers from the boring while simultaneously installing the sand pack. The sand pack will be installed from the bottom of the boring to approximately 1 foot above the top of the screen. A bentonite slurry seal approximately 2 feet thick will be emplaced above the sand pack. The remaining annulus will be backfilled by the tremie grout method using a mixture of bentonite and cement. Surface protection consisting of a 4 inch diameter locking protective casing and three steel posts will be installed.

Figure 6.1 illustrates typical overburden monitoring well construction details.

MN-COMP 0044690

figure 6.1
TYPICAL OVERBURDEN MONITORING
WELL INSTALLATION
Ford Motor Company

CRA

2853-8/02/90-M

Monitoring Well Installation Protocols

Monitoring wells will comply with the Minnesota Department of Health Water Well Construction Code. The following provides a summary of aspects related to field quality assurance.

To eliminate cross-contamination between successive drilling locations, the installation of all monitoring well will be carried out according to the following protocol:

1. Prior to drilling in the initial and all subsequent boreholes, the drilling rig and all drilling equipment will be cleaned using a high pressure-low volume hot water wash and/or steam cleaned with alconox.

2. All drilling water will be obtained from the site potable water supply.

3. All well screens will be of the precleaned Johnson™ Environmental type. All riser pipe and screens will be "steam cleaned" prior to use.

6.2.3 Monitoring Well Development

Well development will be carried out according to the following protocol:

MN-COMP 0044691

1. Monitoring wells will be developed by the surge and bail method using a stainless steel bottom filling bailer. Prior to use, the bailer will be "precleaned" off site using the following solvent rinse sequence: methanol, hexane, methanol, air dry, deionized water.

2. Development will continue until sediment-free water is obtained and three successive readings of pH, temperature and conductivity are measured within the following ranges:

   pH - ±0.1 pH unit

   Temperature - ±0.5°C

   Conductivity - ±10 umhos/cm

3. The purged water will be discharged onto the ground surface.

4. Prior to the measurement of water levels, the measuring instrument will be cleaned with distilled water.

5. All cleaning fluids will be collected and contained for proper disposal.

6. Well development and stabilization records will be maintained. This includes recording readings of pH, temperature, conductivity and cumulative volume of water removed during development.

MN-COMP 0044692

6.2.4 Monitoring Well Sampling

All monitoring wells will be sampled according to the following protocols:

1. New disposable latex gloves will be used when sampling each well. Additional glove changes will be made for each sampling.

2. The sampling will measure and record the depth to water in each well to the nearest 0.01 foot using an electric tape. The bottom three feet of the measuring device will be cleaned by rinsing with deionized water.

3. Prior to sampling, each well will be purged using a precleaned, bottom filling, stainless steel or teflon bailer. A minimum of three times the standing water volume in the well will be removed, or until conductivity and pH readings in the purge water are stable. In the event that a well is purged dry prior to achieving three well volumes, groundwater will be permitted to recover to a level sufficient for sample collection. The time that the well was purged dry will be noted and well recovery will be monitored. Upon recovery, a precleaned bailer will be used for sample collection. Prior to use, each bailer will be cleaned as follows:

   a. Rinse with methanol/hexane/methanol;
   b. Allow to air dry.
   c. Triple rinse with distilled deionized water;

4. All waste groundwater will be discharged to the ground surface.

5. Field measurements of pH and conductivity (using a DspH-3 pH/3 RGE conductivity meter or equivalent) and temperature (using a YSI Model 33 SCT meter or equivalent) will be recorded prior to sample collection. Calibration of field instruments will be conducted as specified in Section 6.4.

6. After the required standing well water has been purged, water samples will be collected using a bottom filling, stainless steel or teflon bailer attached to a nylon rope. New nylon rope will be used for each monitoring well.

7. Containers for sample collection and preservation requirements are determined as required by the analytical parameters. Table 6.4 details the requisite sample containers and preservation techniques for chemical parameters. All sample bottles will be provided by the laboratory and will be prepared consistent with ICHEM 300 Series protocols. The sample bottles will be delivered to the Site in sealed containers.

8. The MS/MSD sample will be taken from a well where samples do not require consideration for turbidity. Samples will be collected from the well as outlined in (5) above, but in triple the normal volume. The analysis request sheets sent to the laboratory will indicate the sample that will undergo MS/MSD analyses.

MN-COMP 0044694

9. All disposable gloves and nylon ropes will be placed in DOT approved 55-gallon drums and stored on-site. All drummed waste will be disposed of in accordance with State and Federal regulations. All rinsings will be handled as discussed in item (3) above.

10. Samples will be labeled noting the well location, date, time and sampler's initials. A separate, hard-cover bound, field notebook will be maintained describing the sampling history (including: date and time of collection, sample handling and storage, preservation and labeling, field measurements, details pertaining to well purging and characteristics of each sample taken, and weather conditions).

11. Samples will be placed on ice or cooler pack in laboratory supplied coolers after collection and labeling.

6.2.5 Surface Water Sampling

The surface water samples will be collected in accordance with the following protocols:

1. New disposable latex gloves will be used when collecting the sample.

2. The sample will be collected by the grab sample method directly into the precleaned sample containers. The most downstream sample will be collected first and sampling will then progress upstream.

3. Containers for sample collection and preservation requirements will be the same as specified for groundwater samples (see Table 6.4).

4. Samples for MS/MSD analyses will be collected in triple the normal volume. The analysis request sheets sent to the contract laboratory will indicate the sample to undergo MS/MSD analyses.

5. Rinsate samples will not be collected since there will be no sampling tools used for collecting these samples. Therefore, field blank samples will be collected at a frequency of 1 per 10 samples, or at least one per day of sampling activities.

6. Samples will be labeled noting the sampling location, date, time and sampler's initials. A separate hard-cover field book will be maintained to document all samples and sampling events. Weather conditions at the time of sampling will be noted.

7. Samples will be placed on ice or cooler packs in laboratory supplied coolers after collection and labeling.

MN-COMP 0044696

6.3 SAMPLE CUSTODY AND DOCUMENT CONTROL

This section details the procedures and protocols which must be followed for the transport of samples.

6.3.1 Chain-of-Custody

A chain-of-custody will be maintained to document the transfer of sample containers. Each sample will be properly sealed. Sample container labels will include sample number, place of collection and date and time of collection. Samples will be placed in the shipping cooler immediately after collection.

Each cooler being shipped to Pace will contain a chain-of-custody form. The chain-of-custody form consists of four copies which are distributed to the shipper, the receiving laboratory, the CRA laboratory and the CRA office file. Each sample number of each sample shipped will be recorded on the sheet. The shipper will maintain his copy while the other three copies are enclosed in a waterproof envelope within the cooler with the samples. The container will then be sealed properly for shipment. The laboratory, upon receiving the samples, will complete the three remaining copies. The laboratory will maintain one copy for their records. One copy will be returned to CRA upon receipt of the samples by the laboratory. One copy will be returned to CRA with the data deliverables package.

MN-COMP 0044697

Upon receipt of the container at the laboratory, the container will be inspected by the designated sample custodian. The condition of the container will be noted on the chain-of-custody record sheet by the sample custodian. The sample custodian will document the date and time of receipt of the container and sign the form.

If damage or discrepancies are noticed, it will be recorded in the remarks column of the record sheet, dated and signed. Any damage or discrepancies will be reported to the laboratory supervisor who will inform the lab manager and QA officer. The lab QA officer will than notify the CRA QA Officer - Analytical Activities.

6.3.2 Sample Documentation in the Laboratory

The sample custodian will assign a unique number to each incoming sample for use in the laboratory. The unique number and customer number will then be entered into the sample receiving log. The laboratory date of receipt will also be noted.

Pace will be responsible for maintaining analytical log books and laboratory data, as well as sample (on hand) inventory for submittal to CRA on an "as required" basis. Samples will be maintained by the laboratory for a period of 30 days following CRA's receipt of the respective sample data under the conditions prescribed by the appropriate U.S. EPA methods for additional

MN-COMP 0044698

analyses, if necessary. Raw laboratory data files will be inventoried and maintained by Pace for a period of five years at which time CRA will advise Pace regarding the need for additional storage.

6.3.3 Storage of Samples

After the sample custodian has prepared the log book, the chain-of-custody will be checked to ensure that all samples are stored in the appropriate locations. All samples will be stored within an access controlled location and will be maintained at 4°C until completion of all analytical work or, as a minimum, for 30 days.

6.3.4 Sample Documentation - CRA

Project files for the entire project will be inventoried and maintained by CRA and will consist of the following:

- Project Plan
- Project Logbooks
- Field Data Records
- Sample Identification Documents
- Chain-of-Custody Records
- Correspondence
- Report Notes, Calculations, etc.

MN-COMP 0044699

- Data Packages,
- References, Literature
- Miscellaneous - photos, maps, drawings, etc.
- Final Report

The project file materials will be the responsibility of the evidentiary file custodian with respect to maintenance and document removal. Jon Christofferson will be the project file custodian.

6.4 CALIBRATION PROCEDURES AND FREQUENCY

The procedures indicated below will be performed for all samples delivered to Pace for analysis. Specific instructions relevant to a particular type of analysis are given in the pertinent analytical procedures for this project.

All quality control data and records produced from calibration will be retained by the laboratory and will be made available to CRA on an "as required" basis.

The following specific analytical quality control procedures are related to each analytical batch.

MN-COMP 0044700

Laboratory protocols and QA/QC procedures for Pace are provided in Appendix I.

6.4.1 Instrument Performance

Prior to initiating analysis, it is required to establish that a given instrument meets the specifications required.

6.4.1.1 Organic Analyses

Internal standards retention times must be within two percent of the initial standard. In addition, a laboratory prepared sample is analyzed with each batch of samples. Percent recovery for this sample is required to be within ten percent of actual analyte concentrations. If either criteria is not met, analysis of samples is halted until the problem is corrected.

6.4.2 Calibration

Prior to analysis, laboratory instruments will be calibrated using procedures for VOC and metals analyses specified by Pace (see Appendix I).

MN-COMP 0044701

6.4.2.1 Calibration of Gas Chromatograph

A five-point calibration curve is prepared by Pace each day analyses are performed. Calibration factors are calculated for each analyte and percent relative standard deviations (%RSD) are calculated. Each %RSD value must be less than 20, otherwise the calibration procedure must be repeated for any analyte that failed this criterion.

A calibration check is conducted after every ten samples. Calibration factors values from this sample must be within 15 percent of the initial calibration factor, based upon the relative percent difference. If this criterion is not met, analysis of samples will stop until the problem is corrected. This may result in generating a new five-point calibration curve.

6.4.2.2 Standard Curves for Inorganic Analysis

Standard curves used in metals analyses will be prepared as follows:

Standard curves derived from data consisting of one reagent blank and a minimum of three concentrations will be prepared for each inorganic analyte. The standard curve will be used with each subsequent analysis, provided the standard curve is verified by using at least one reagent blank and one standard at a level normally encountered or expected in such samples. If the results of the verification are not within ±10 percent of the original curve, a new

standard will be prepared and analyzed. If the results of the second verification are not within ±10 percent of the original standard curve, a reference standard will be used to determine if the discrepancy is with the standard or with the instrument. New standards will also be prepared on a quarterly basis at a minimum. All data used in drawing or describing the curve will be so indicated on the curve or its description. A record will be made of the verification.

6.4.2.3 Field Instrument Calibration

Calibrating field instruments will be done prior to the collecting each water sample if well purging data indicate a change (>±10 percent) in pH and/or conductivity from the last location sampled. However, calibration will be conducted at least daily during groundwater sampling. The field equipment will be maintained, calibrated and operated in a manner consistent with the manufacturer's guidelines and U.S. EPA standard methods. Since the majority of field measurements will be limited to pH, conductivity, temperature and depth (water level) the following procedures will be conducted, at a minimum:

1) pH
   - Calibrate daily against two buffer solutions within a pH of 2 of the anticipated water pH.

MN-COMP 0044703

A) Calibration of pH Meter

The pH meter will be calibrated with commercially obtained pH 7, 4 and 10 buffer solutions. The pH calibration will be temperature compensated and will be performed immediately before initiating a sampling event. Calibration checks will be performed with every sample collected. In the event that the result fails to be within 0.1 pH units, the meter must be recalibrated and all samples after the last calibration must be remeasured.

Calibration will be performed in accordance with the following procedure:

1) Rinse the probe in deionized water;
2) Insert probe in a fresh pH 7 buffer solution;
3) Slide battery compartment cover back to the first stop, exposing the adjustment potentiometers;
4) Adjust the "CAL" potentiometer such that the display reads 7.00;
5) Remove the probe; rinse in deionized water;
6) Insert probe in a fresh pH 4 or pH 10 buffer solution;
7) Adjust the slope potentiometer until the correct pH is displayed; and
8) Remove probe; rinse in deionized water.

2) Conductivity

- Check once per sampling event against a standard solution of potassium chloride and deionized water.

B) Calibration of the Specific Conductivity Meter

The specific conductivity meter is factory calibrated, but the calibration should be checked periodically and the probe thoroughly rinsed between samples. Calibrating the specific conductivity meter will be performed as follows:

1) Rinse probe in deionized water;
2) Wipe probe and allow to dry the conductivity displayed should be zero in air;
3) Adjust the zero potentiometer if necessary;
4) Immerse the probe in a solution of known conductivity;
5) Adjust the "SPAN" potentiometer such that the correct conductivity is displayed; and
6) Rinse probes thoroughly with deionized water and allow to dry.

3) HNu

HNu calibration checks will be done daily in the field prior to the commencement of field activities.

MN-COMP 0044705

C) Calibration Checks of the HNu

Calibration checks will be performed in accordance with the following procedures:

1) Connect the analyzer to the regulator and cylinder with a short piece (butt connection) of tubing. The calibration gas in the cylinder consists of a mixture of isobutylene and zero air. Isobutylene is non-toxic and safety to use in confined areas. There are no listed exposure levels at any concentration.

   It is important that the tubing be clean since contaminated tubing will affect the calibration reading. Do not use cylinder below about 30 psig as a reading below that level can deviate up to ten percent from the rated value.

   Safely discard the disposable cylinder when empty. Do not refill this cylinder.

2) With the SPAN setting and the function switch at the same positions as listed in the Application Data Sheet or Calibration Report, open the valve on the cylinder until a steady reading is obtained.

3) If the reading is the same as the recorded data, the analyzer calibration for the original species of interest is still correct.

MN-COMP 0044706

4) If the reading has changed, adjust the SPAN setting until the reading is the same.

5) Shut off the cylinder as soon as the reading is established.

6) Record and maintain this new SPAN setting.

6.5 ANALYTICAL PROCEDURES

This section presents the analytical methods which will be employed by Pace to complete all required analyses.

6.5.1 Overview

All soil, surface water and groundwater samples collected for chemical analyses will be analyzed using SW-846 methods. The methods for performing these analyses are presented on Table 6.5. The analyses of VOC and metals will be performed in a manner consistent with these analytical methods.

MN-COMP 0044707

TABLE 6.5

ANALYTICAL METHODS FOR ANALYSIS OF SOIL AND AQUEOUS SAMPLES[1]

Matrix	Analysis	Extraction	Method
Soil	VOC	5030	8010/8020
	Metals		6000/7000 Series
Water	VOC	5030	8010/8020
	Metals		6000/7000 Series

Note:

1. All methods are from "Test Methods for Evaluating Solid Waste", SW-846, third edition, September 1988.

MN-COMP 0044708

6.5.2 Identification

Identification of all target analytes will be accomplished with an authentic standard of the analyte. When authentic standards are not available identification will be considered tentative.

For gas chromatographic determinations of specific analytes, the relative retention time of the unknown will be compared with that of an authentic standard. Since a true identification using GC is not possible, an analytical run for compound confirmation will be performed using a column of a dissimilar phase, according to the specifications in the methods. Peaks must elute within daily retention time windows established for each indicator parameter to be declared a tentative or confirmed identification. Retention time windows are determined via a standard a study defined in each method. Results of the study are to be filed in the laboratory and available for inspection during a QC audit.

6.5.3 Quantification

The procedures for quantification of analytes are discussed in the appropriate specific analytical methods.

MN-COMP 0044709

6.5.4 Practical Quantitation Limits (PQLs)

The data used to conduct the RI/FS will have PQL detection limits that are consistent with the appropriate analytical methods. The PQLs for chemical analyses were previously presented on Tables 6.2 and 6.3. Specific detection limits are highly matrix dependent. The PQLs listed in these tables are provided for guidance and may not always be technically achievable.

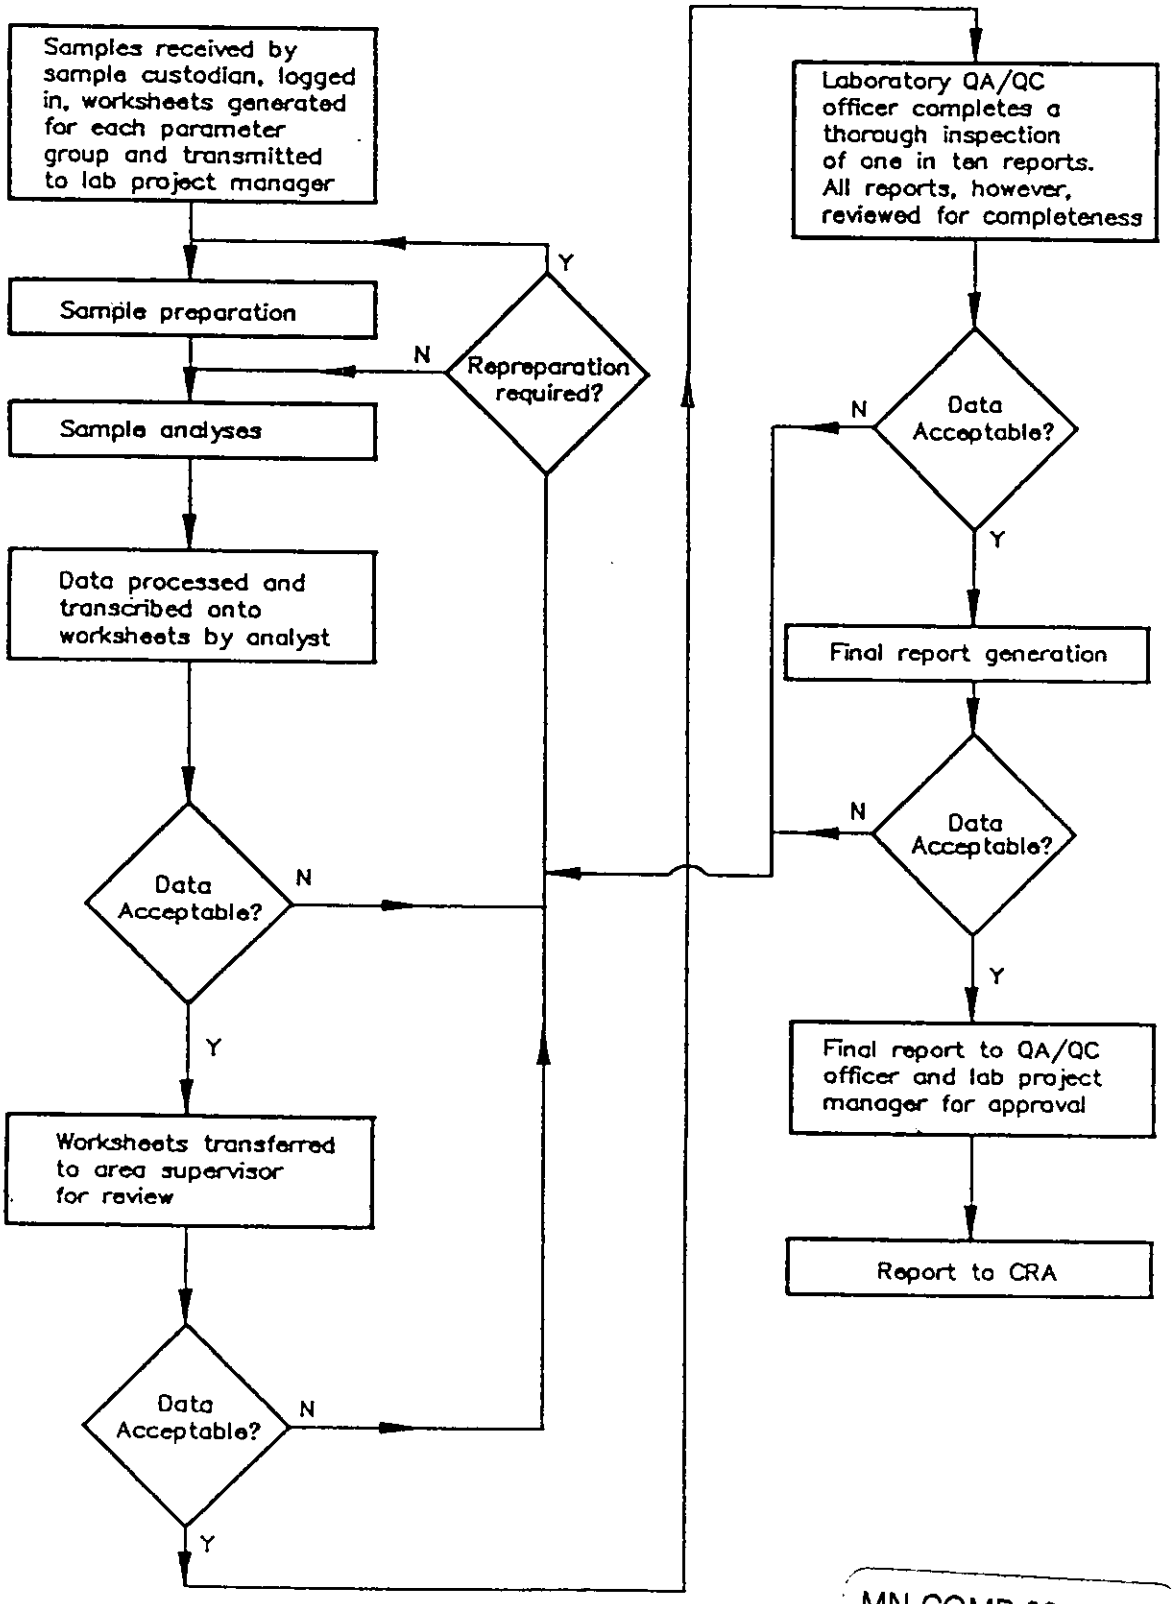
6.6 DATA REDUCTION, VALIDATION ASSESSMENT AND REPORTING

Pace will perform analytical data reduction and validation in-house under the direction of the laboratory QA officer. The laboratory QA officer will be responsible for assessing data quality and advising of any data which were related "preliminary" or "unacceptable" or other qualifications. Figure 6.2 illustrates the analytical data flow through the laboratory. Data reduction, validation and reporting by the laboratory will be conducted as detailed in the following. It should be noted, however, that "sign-off" will be required following completion of each step.

- Raw data produced and checked by the responsible analyst is turned over for independent review by another analyst.

- Area Supervisor reviews that data for attainment of quality control criteria presented in the referenced analytical methods.

MN-COMP 0044710



MN-COMP 0044711

figure 6.2

ANALYTICAL DATA FLOW

Ford Motor Company

CRA

2853-20/08/90-M

- Laboratory Operations Manager reviews that data and a report will be generated and sent to the laboratory quality assurance officer.

- Laboratory Quality Assurance Officer will complete a thorough inspection of all reports.

- Area Supervisor and QA officer will decide whether any sample reanalysis is required.

- Upon acceptance of the preliminary reports by the QA officer, final reports will be generated and signed by the laboratory manager.

The data package shall consist of the following:

- detailed case narrative,
- summary of analysis dates,
- method blank sample data,
- surrogate compound recoveries,
- MS/MSD recoveries,
- check sample recoveries,
- executed chain-of-custody forms.

CRA's QA Officer - Analytical Activities will conduct an evaluation of data reduction and reporting by the laboratory. These evaluations will consider the finished data sheets, rinsate data, field duplicate data, and recovery data for surrogate and matrix spikes. The material will be checked for legibility, completeness, correctness, and the presence of requisite dates, initials

MN-COMP 0044712

and signatures. The results of these checks will be assessed and reported to the project managers noting any discrepancies and their effect upon the acceptability of the data. All information garnered from QA/QC checks will be discussed in the final RI/FS Report.

Validation of the analytical data will be performed by the CRA QA Officer - Analytical Activities. Validation will be consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses", February 1, 1988, and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses", July 1, 1988. Assessment of analytical and field data will include checks for data consistency by looking for comparability of duplicate analyses, potential sample contamination as indicated by results of blank sample analyses, laboratory QA procedures, adherence to accuracy and precision criteria, transmittal errors, and anomalously high or low parameter values. The results of data validations will be reported to the project managers, noting any discrepancies and their effect upon acceptability of the data.

Raw data from field measurements and sample collection activities that are used in project reports will be appropriately identified and appended to the report. Where data have been reduced or summarized, the method of reduction will be documented in the report. In addition, field data will be audited for anomalously high or low values that may appear to be inconsistent with other data.

MN-COMP 0044713

6.7 INTERNAL QUALITY CONTROL CHECKS AND FREQUENCY

6.7.1 Field QC

Quality control procedures for field measurements will be limited to checking the reproducibility of the measurement in the field by obtaining multiple readings and by calibrating the instruments (where appropriate).

Quality control of field sampling will involve collecting field duplicates and rinsate blanks in accordance with the applicable procedures.

6.7.2 Laboratory QC

Specific procedures related to internal laboratory QC samples (namely, matrix spikes, surrogate spikes, blanks, check samples and matrix spike duplicates) are detailed in the following subsections.

6.7.2.1 Method Blank

A method blank will be analyzed by the laboratory at a frequency of one per twenty analyses or, in the event that an analytical round

MN-COMP 0044714

consists of less than twenty samples, one reagent blank will be analyzed. The reagent blank, an aliquot of analyte-free water or solvent, will be carried through the entire analytical procedure.

6.7.2.2 Matrix Spikes/Matrix Spike Duplicates (MS/MSD)

A MS/MSD sample will be analyzed at a minimum frequency of 1 in 20 for each method per matrix. Table 6.6 presents a summary of the compounds and acceptable criteria. Percent spike recoveries will be used to evaluate analytical accuracy while percent relative standard deviation or percent difference between the spike and matrix spike duplicate will be used to assess analytical precision.

6.7.2.3 Surrogate Compounds

Surrogate compounds are used in all VOC analyses. Every blank, standard and environmental sample, including MS/MSD samples, will be spiked with surrogate compounds prior to purging volatiles.

Surrogate compounds will be spiked into samples according to the appropriate analytical methods. Percent recoveries will fall within the control limits set by procedures specific in the method for analytes falling within the detection limits without dilution. Diluting samples to bring the analyte

TABLE 6.6

PERCENT RECOVERIES AND PRECISION CRITERIA FOR MS/MSD ANALYSES

Analysis	Parameter	% Recovery[1] Water	% Recovery[1] Soil
VOC	Trichloroethene	35-146 (20)	35-146 (50)
	Chlorobenzene	38-150 (20)	38-150 (50)
	Benzene	39-150 (20)	39-150 (50)
	1,1-dichloroethene	28-167 (20)	28-167 (50)
Metals		75-125 (20)	75-125 (50)

Note:

1. Values in parentheses are maximum RPD limits.

MN-COMP 0044716

concentration into the linear range of calibration may dilute the surrogates below the quantification limit; assessment of analytical quality in these cases will be based on the quality control embodied in the check and MS/MSD samples.

Table 6.7 presents a summary of the surrogate recovery control limits as stated within the analytical methods.

6.7.2.4 Check Samples

As prepared by Pace, each analytical batch will contain a check sample. The check sample will consist of an analyte-free water spiked with MS compounds. Check samples will be carried through all procedures, including extractions, by Pace. Percent recoveries for check samples will be within ten percent of actual analyte concentrations.

6.8 PERFORMANCE, SYSTEM AUDITS AND FREQUENCY

For the purpose of external evaluation, performance evaluation check samples from the U.S. EPA and various state agencies are analyzed periodically by Pace.

Internally, the evaluation of data from these samples is done on a continuing basis over the duration of a given project.

MN-COMP 0044717

TABLE 6.7

PERCENT RECOVERIES FOR VOC SURROGATE COMPOUND

Compound	% Recovery	
	Water	Soil
α,α,α-trifluorotoluene	80-120	-

MN-COMP 0044718

The CRA QA Officer - Analytical Activities may carry out performance and/or systems audits to insure that data of known and defensible quality are consistently produced during a program.

System audits are qualitative evaluations of all components of field and laboratory quality control measurement systems. They determine if the measurement systems are being used appropriately. The audits may be carried out before all systems are operational, during the program, or after the completion of the program. Such audits typically involve a comparison of the activities given in the QA/QC plan described herein, with activities actually scheduled or performed. A special type of system audit is the data management audit. This audit addresses only data collection and management activities.

The performance audit is a quantitative evaluation of the measurement system used for a monitoring program. It requires testing the measurement systems with samples of known composition or behavior to evaluate precision and accuracy. A performance/system audit may be carried out by or under the auspices of the MPCA, without the knowledge of the analyst during each sampling event for this program. The scheduling of performance evaluation (PE) audits will be at the discretion of the MPCA.

In addition, one external QA audit may be conducted by CRA prior to analysis of any investigatory samples. It should be noted, however, that any additional external QA audits will only be performed if deemed

MN-COMP 0044719

necessary by either the PRP or CRA project managers or the CRA QA officers. The project laboratory may also undergo PE audit(s) by the MPCA, if so requested.

6.9 PREVENTIVE MAINTENANCE

All analytical instruments to be used in this project will be serviced by Pace personnel at regularly scheduled intervals in accordance with the manufacturer's recommendations. Instruments may also be serviced at other times due to failure. Requisite servicing beyond the abilities of Pace personnel will be performed by the equipment manufacturer or their designated representative.

Daily checks of each instrument will be by the analyst who has been assigned responsibility for that instrument. This will include changing GC inlet liners, checking operation of data systems, checking for leaks, etc. Manufacturer's recommended procedures will be followed in every case.

The HNu, pH and conductivity meters will be calibrated in the field as described in Section 6.3.2.3. In addition, the following preventive maintenance measures will be taken in the field:

HNu - The HNu meter is sent annually to the manufacturer for recalibration and cleaning.

MN-COMP 0044720

pH, Conductivity - Keep probes clean and free of dirt by rinsing with deionized water.

- Keep deionized water around probes to prevent dehydration.

Water Level Tape - Clean probe and lower three feet of tape with pesticide grade isopropanol and deionized water to prevent hard water and iron build up.

6.10 SPECIFIC ROUTINE PROCEDURES USED TO ASSESS DATA PRECISION, ACCURACY AND COMPLETENESS

6.10.1 QA Measurement Quality Indicators

6.10.1.1 Precision

Precision will be assessed by comparing the analytical results between MS/MSD analyses and/or duplicate sample analyses.

MN-COMP 0044721

6.10.1.2 Accuracy

Accuracy will be assessed by comparing a set of analytical results to the accepted or "true" values that would be expected. In general, surrogate compound recoveries, MS/MSD analyses and check sample recoveries will be used to assess accuracy.

6.10.1.3 Outliers

Procedures discussed previously will be followed for documenting deviations. In the event a result deviates significantly from established control limits, this deviation will be noted and its effect on the quality of the remaining data assessed and documented.

6.11 CORRECTIVE ACTION

The need for corrective action may be identified by system or performance audits or by standard QC procedures. The essential steps in the corrective action system will be:

- Checking the predetermined limits for data acceptability beyond which corrective action is required;

MN-COMP 0044722

- Identifying and defining problems;

- Assigning responsibility for investigating the problem;

- Investigating and determining the cause of the problem;

- Determining corrective action to eliminate the problem (this may include reanalyses of resampling and analyses);

- Assigning and accepting responsibility for implementing the corrective action;

- Implementing the corrective action and evaluating the effectiveness;

- Verifying that the corrective action has eliminated the problem; and

- Documenting the corrective action taken.

For each measurement system, the CRA QA Officer - Analytical Activities will be responsible for initiating the corrective action and the laboratory supervisor will be responsible for implementing the corrective action. The corrective action taken will depend upon the QA/QC criteria that did not meet the necessary criteria, and may range form qualifying the data to resampling at the Site.

MN-COMP 0044723

6.12 QUALITY ASSURANCE REPORT TO MANAGEMENT

Management will receive reports on the performance of the measurement system and the data quality following each sampling round and at the conclusion of the report.

Minimally, these reports will include:

- Assessment of measurement and quality indicators, i.e. data accuracy, precision and completeness;
- Results of system audits; and
- QA problems and recommended solutions.

The CRA QA Officer - Analytical Activities will be responsible within the organizational structure for preparing these periodic reports. The final report for the project will also include a separate QA section which will summarize data quality information contained in the periodic QA/QC reports to management, and details and overall data assessment and validation in accordance with the data quality objectives outlined in this QAPP.

MN-COMP 0044724

7.0 DATA MANAGEMENT AND DOCUMENTATION

7.1 DATA MANAGEMENT PLAN

Sampling and analytical records will be generated in accordance with the quality assurance plan presented in Section 6. Data generated will be validated prior to inclusion into the database. D-Base and Lotus™ software will be used as appropriate for computer compilation, tabulation and assessment of data records.

Project reports will be submitted according to the schedule provided in Section 11.

DATA RECORD

Each data record entered into the database will include the following information:

1. sample location,
2. the date the sample was taken,
3. analyzed parameter,
4. field measurement raw data,
5. laboratory performing the analysis,
6. analytical method and
7. result of analysis (i.e. concentration).

MN-COMP 0044725

TABULAR DISPLAYS

Data may be tabulated in the following ways:

1. unsorted (raw) data,
2. summary of data of detected parameters and
3. sorting of data according to location, aquifer or constituent monitored.

GRAPHICAL DISPLAYS

Data may be displayed graphically in the following ways:

1. display of line graphs of concentration versus time for selected sampling locations noted in the data evaluation,
2. displays of the geographical extent of the contamination by use of isopleth maps as noted in the data evaluation and where otherwise appropriate, and
3. graphical displays of hydrogeologic data and interpretation as found appropriate.

7.2 DATA AND DOCUMENT AVAILABILITY AND RETENTION

Ford will allow MPCA staff and/or its authorized representatives to inspect and copy all sampling, testing, monitoring or other data transmitted to or generated by Ford pertaining to work undertaken under the RFRA program of work. Ford will allow duplicate/split samples to be

collected by MPCA and/or its authorized representatives of any samples collected by Ford pursuant to the work plan. Ford will maintain a central depository of the data, reports and other documents prepared pursuant the work plan. All data, reports and other documents will be preserved by Ford until Ford receives written approval from the MPCA to allow otherwise.

MN-COMP 0044727

8.0 RISK ASSESSMENT

A baseline risk assessment will be conducted for the Site. The risk assessment will provide an evaluation of the actual and potential threat to human health, welfare and the environment posed by the possible threatened releases of hazardous substances, pollutants or contaminants in the absence of any remedial action. The objectives of a baseline risk assessment shall be attained by identifying and characterizing the following:

1. An evaluation of the results of the Site investigation showing the actual and potential concentrations of hazardous substances, pollutants or contaminants present in relevant media (e.g. air, soil, groundwater, surface water, sediment and biota) at the conclusion of the RI and projected in the future. The evaluation is expected to focus on VOCs and metals at the Site.

2. Identification of the hazardous and toxicological properties and relevant human health and environmental standards criteria for the hazardous substances, pollutants or contaminants found in the Site investigation.

3. Environmental fate and transport mechanisms within specific environmental media such as physical, chemical and biological degradation processes and hydrogeological conditions.

4. Potential human and environmental receptors.

5. Potential exposure pathways and extent of actual or expected exposure.

6. Extent of expected impact or threat, and the likelihood of such impact or threat occurring (i.e. risk characterization).

7. Level(s) of uncertainty associated with the above items.

The risk assessment will be prepared using the U.S. EPA document "Risk Assessment and Guidance for Superfund", Interim Final, Volume 1 (December 1989) and Volume 2 (March 1989).

MN-COMP 0044729

9.0 SITE SECURITY AND SAFETY PLAN

9.1 SITE SECURITY

Current Site operations do not allow for public access to operating facilities. The following Site security control measures are in place:

1. The Ford Plant has its own 24-hour per day plant security guards.

2. The investigation sites, Site A, Site B and the UST area, are enclosed within the Plant's security fence. The fence is steel chain link 8 feet high.

3. The Site is watched by video cameras strategic location above the various Plant areas and all investigation sites.

4. The Site C area also is controlled by fencing and is watched by video camera.

5. All monitoring wells at the Site are completed with locking protective riser pipes and bumper posts as per the MDH Water Well Code.

6. All areas are patrolled by Ford security.

7. All Site and Plant visitors must sign in with Plant security before entering the Site. Visitors will be issued passes once access is approved.

MN-COMP 0044730

9.2 HEALTH AND SAFETY PLAN

Appendix J provides the health and safety plan for the Site operations, maintenance and monitoring activities covered by this RI. This plan is consistent with the requirement of:

1. OSHA requirement 29 CFR Part 1910.120, Hazardous Waste Operations and Emergency Response; Interim Final Rule, Federal Register, December 19, 1986.

2. OSHA requirements 29 CFR part 1910 (General Industry Standards) and 1926 (Construction Industry Standards).

3. Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities, NIOSGH/OSHA/USCG/EPA, DHHS (NIOSH) Publication Number 85-115, October 1985.

10.0 COMMUNITY RELATIONS PLAN

GENERAL

The overall goal of the Community Relations Plan (CRP) is to plan for an organized dissemination of information to the public regarding investigation, activities and results upon request. The Ford CRP therefore includes opportunities for comments and input by citizen, community and other groups.

Elements of the Community Relations Plan are:

1. Establishment of a communication process in conjunction with the MPCA project manager and MPCA's public information office.

2. Ford Plant Employee Relations personnel will be available for communication with persons who have expressed interest (interested persons) to receive as well as provide information.

3. Reliable information will be made available to interested persons who have requested to review the information.

COMMUNITY RELATIONS

The Ford Community Relations Plan Coordinator for this project will be Edward Lloyd - Employee Relations Manager.

The MPCA Coordinator will be J. Todd Goeks.

These Coordinators will keep up to date on all aspects of progress on the RI/FS.

Questions regarding the RI/FS that originate from the public should be first directed to the MPCA Coordinator.

In order to accomplish the CRP goals, Ford will conduct the following:

a. Create and maintain a mailing list of interested parties. Among the persons who shall be included on this list are the MPCA Public Information Officer assigned to this Site, the Mayor of the City of St. Paul, City Council Member Bob Long (representing the City Council of the City of St. Paul), the Chairperson of the St. Paul Parks and Recreation Board, the State Senator and State Representative whose districts include the Site, and any citizen or environmental groups that have expressed an interest.

MN-COMP 0044733

b. Provide written monthly progress reports to the MPCA as specified in Part II.C. (page R-3) of the RFRA. These progress reports will note, as appropriate in addition to all monthly activities, the status of:

- the Remedial Investigation,
- the Feasibility Study,
- the Record of Decision, and
- any interim remedy or response activity.

REPORTS AND DOCUMENTS

All project reports, progress reports, sampling results and documents will be made available to the MPCA by Ford according to the project schedule. Citizens groups and interested persons can make requests to review the content of these documents by contacting MPCA.

PUBLIC COMMENT

Copies of the project RI/FS report will be available through normal public access for review and comment at the MPCA St. Paul offices. Public comments made through the MPCA will be considered in the preparation of final reports, thus ensuring public input on final results.

PUBLIC INFORMATION

Information from the public should be transferred through the Coordinators to CRA for consideration in the RI/FS. Similarly, information provided by CRA should be through the Coordinators to the public as requested.

MN-COMP 0044735

11.0 REPORTING AND PROJECT SCHEDULE

11.1 MONTHLY SUMMARY/PROGRESS REPORT

A monthly summary/progress report noting activities conducted under the work plan and the RFRA will be prepared.

The report will provide information on the preceding month and be submitted by the 15th day of the following month.

11.2 RI FINAL REPORT

An RI Final Report will be prepared presenting the results and evaluation of data and information obtained by implementation of this work plan and in accordance with the procedures provided in this work plan.

The RI Final Report will provide a screening of possible remedial alternatives as presented in Section 3.0 of this work plan. It is proposed that this report be submitted according to the schedule presented in Section 11.3.

11.3 RI/FS SCHEDULE

Ford has provided notice of intent to comply with the RFRA and has retained a consultant. Portions of the work related to the RI have been ongoing prior to this work plan submittal.

Submittal of this RI/FS Work Plan is scheduled for August 31, 1990. Based on the RFRA, the following schedule for remaining RI Work Plan tasks is anticipated:

Implement Site Security and Safety Plan	Within 10 days of MPCA written approval of RI/FS Work Plan.
Conduct RI Work Contained in RI/FS Work Plan	Begin within 2 weeks of MPCA written approval of RI/FS Work Plan.
Submit RI Final Report	Within 150 days of MPCA written approval of RI/FS Work Plan. This differs from RFRA schedule, however, is necessary given the time needed to complete work plan tasks and prepare report after approval of work plan. Should the work plan not be approved by

MN-COMP 0044737

	September 30, 1990, weather delays may also occur and should be anticipated in project scheduling.
Submit Treatability Studies and Feasibility Study - Detailed Analysis Report (DAR)	Within 60 days of MPCA written approval of RI Final Report.

Dear Mr. Goeks:

RE: Ford Motor Company
Twin Cities Assembly Plant
St. Paul, Minnesota

On behalf of Ford Motor Company (Ford) we are submitting the following information as a result of discussions that occurred at our recent January 31 meeting.

1. A Work Plan for supplemental monitoring at Site C (the fill area near the river) is enclosed to provide a summary of groundwater and surface water monitoring to be conducted by Ford. This monitoring would include the installation of one additional well with two subsequent rounds of monitoring.

2. Waste characterization information is enclosed to complete your files regarding the paint sludge material excavated during the wastewater treatment plant construction in July 1983. These copies of documents located in Ford's files include:

   - a copy of the laboratory report dated July 7, 1983, for analysis of the excavated material for EP Toxicity. By applying knowledge of the material and processes used, Ford determined that the waste was also non-reactive,non-corrosive and non-ignitable;

   - a copy of the manifests for the three shipments of the excavated material made on July 14 and 27, 1983. We understand from Ford that the waste was shipped and disposed of as a hazardous waste (Waste Classification Number D008) despite the fact that the material was found to be "non-EP Toxic" for lead;

   - a copy of a map that accompanied Ford's Amended Superfund Notification to U.S. EPA dated August 16, 1983, indicating the approximate area of excavation.

3. A portion of the south face of the Site C fill area is proposed for landscaping and aesthetic cleanup to remove empty drums and drum parts. Tasks related to this effort will be:

   - the landscaping contractor will be contracted by Ford and receive its primary directions from Ford;

MN-COMP 0044744

- Conestoga-Rovers and Associates (CRA) will assist in delineating the work area and will provide input to Ford on the area appropriate for further aesthetic cleanup and landscaping;

- Once the work area has been delineated, MPCA will be advised prior to work proceeding. As discussed at our meeting, MPCA will provide notification and coordination with other regulatory agencies;

- work will then proceed as weather permits. It is expected that work could begin as early as May 1, 1990;

- after brush and several trees have been cleared from the defined area, approximately 500 cubic yards of soil will be placed over the sloped face and then seeded for aesthetic and erosion control purposes.

Should you have any questions regarding this information, please contact Mr. Jerome Amber of Ford at telephone number (313) 322-4646 or me at CRA's local office, telephone number 639-0913.

Yours Very Truly,

CONESTOGA-ROVERS AND ASSOCIATES

Jon L. Christofferson

ATTACHMENT 1
WORK PLAN
SUPPLEMENTAL GROUNDWATER MONITORING
SITE C
FORD TWIN CITIES ASSEMBLY PLANT
ST. PAUL, MINNESOTA

Task 1 - Installation of Additional Monitoring Well

- Install additional Monitoring Well B6 (see attached Figure 1 for proposed location).

- Well to be installed in accordance with Minnesota Department of Health Water Well Code. Well construction detail provided as attached Figure 2. To be two feet above the 100 year flood plain elevation of 707 feet AMSL (based on Army Corps of Engineers 100 year flood elevation for Lock and Dam #1 tail water) top of well casing would have to be at a minimum elevation of 709 AMSL. Because this may not be implementable, a variance to the Well Code and/or further discussions with MPCA may be required.

  Installation of Well B6 would be scheduled to be completed by March 30, 1990.

- Develop well prior to sampling.

Task 2 - Groundwater and Surface Water Sampling

- Water level round prior to sampling.

- Sample groundwater wells B1, B3 and B6.

- Sample surface location upstream and downstream of site utilized during 1989 monitoring.

- Each monitoring round to include on blank and one duplicate sample.

- Samples will be analyzed for Halocarbon and Aromatic Organic Compounds by EPA Method 601 and 602 plus cis-1,2-dichloroethylene and ethylacetate. Analysis will also be conducted for the following metals: Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Selenium, Silver, Zinc and Nickel. Groundwater samples will be field filtered prior to metals analysis. Surface water samples will not be filtered prior to analysis. Metals analysis for Barium, Cadmium, Chromium, Copper, Lead, Silver, Zinc and Nickel will be conducted using Inductively Coupled Plasma (ICP) analysis EPA Method 6010. Analysis for Arsenic, Selenium and Mercury will be conducted using EPA Atomic Absorption methods.

- Sampling rounds will be tentatively scheduled for early April and early June.

Task 3 - Data Monitoring Report

Following completion of the two rounds of sampling and receipt of analytical results, a report summarizing all data and results will be submitted to MPCA. The report will be scheduled for submittal by July 17, 1990.

GME Project No. 2014

Re: Report for monitoring well abandonment and monitoring well surface protection at the Ford Plant in South St. Paul, Minnesota

Dear Mr. Mockenhaupt:

On March 3, 1989, we received authorization for the abandonment of existing monitoring wells, and the installation of surface protection at this site in Minneapolis, Minnesota. In accordance with your acceptance of our proposal, we have completed our services. This project was completed in compliance with our understanding of Minnesota Department of Health (MDH) regulations. Enclosed is our report including the MDH well abandonment logs, and a description of our services.

MONITORING WELL ABANDONMENT

Two existing monitoring wells (B-2 and B-4) were abandoned. Our drill crew retrieved as much down-hole 2 inch PVC riser pipe as possible by hand and with the Mobile B-24 rig. The wells were then grouted with neat cement to within two feet of the surface. Native soil was used to fill the remaining space in the boreholes.

You also requested that we upgrade the above ground protection for three existing monitoring wells at the site. Our drill crew installed three, 4 inch diameter by 8 foot long protective steel posts and one, 4 inch diameter by 5 foot long locking protective steel cap at B-1, B-3, and B-5. At B-5, the existing 2 inch PVC riser pipe was cut-off below grade and replaced with a new section. All the protective posts were cemented into place.

MN-COMP 0044773

The monitoring well abandonment procedures and above ground protection installation were supervised by our Minnesota Licensed Water Well Driller in accordance with MDH regulations.

GENERAL QUALIFICATIONS

This report is a summary of the services performed at the Ford Plant site in South St. Paul, Minnesota. No warranty, either expressed or implied, is presented in this report with respect to the soil and groundwater conditions at this site.

We appreciate the opportunity to be of service to you for this project. If you have any questions regarding this report or if we may be of further assistance to you, please do not hesitate to contact us.

Sincerely,

GME CONSULTANTS, INC.

James A. Nordstog

DATA QUALITY ASSESSMENT
GROUNDWATER AND
SURFACE WATER SAMPLES
FORD SITE C

MN-COMP 0044788

MEMORANDUM

TO: Jon Christofferson REFERENCE NO.: 2853

FROM: David Dempsey DATE: June 7, 1990

RE: Data Quality Assessment and Validation for Seven Groundwater Samples Collected During the April 1990 Sampling Event at the Ford Site C Project Site

---

The following details a data quality assessment and validation for seven groundwater samples collected on April 19, 1990 at the Ford Site C Project Site. The samples were analyzed for site-specific parameters, namely, volatile organic compounds (VOC) and metals by Pace Laboratories, Inc. (Pace).[1] Quality assurance criteria were established by the analytical methods.[2]

Holding Time Periods

Holding time periods were established by the analytical methods and are summarized below:

VOC	-14 days from sample collection to completion of analysis
Metals	-6 months from sample collection to completion of analysis, except for mercury -28 days from sample collection to completion of analysis for mercury

As all samples met the above criteria, the data were found to be acceptable based upon the holding time periods.

Method Blank Samples

The potential for sample contamination through laboratory protocols was measured by means of method blank samples. The VOC method blank sample contained methylene chloride at a concentration of 1.42 µg/l. Methylene chloride data for samples

---

[1]Analytical methods were taken from 40 CFR Part 136 Appendix A and "Methods for Chemical Analysis of Water and Wastes", EPA-600/4-79-020, revised March 1983 and are summarized below:

VOC	-601/602
Metals	-200 Series

[2]Application of quality assurance criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses", February 1, 1988 and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses, July 1, 1988.

MN-COMP 0044789

W-041990-JM-01, W-041990-JM-02 and W-041990-JM-03 were qualified as non-detect (U), as a result. Similarly, the metals method blank sample was found to contain analytes copper and zinc at concentrations of 0.023 mg/l and 0.05 mg/l, respectively. Sample W-041990-JM-06 had its copper datum qualified as non-detect (U), while no action upon the zinc data was required. Of interest was the fact that no method blank sample was reported for selenium. However, as all samples were reported to be free of selenium, no action upon the selenium data was necessary.

Surrogate Compounds Percent Recoveries (Surrogate Recoveries)

Individual sample performance for VOC analyses was to be monitored via surrogate recoveries. To date, no surrogate data have been received from Pace. Therefore, matrix spike/matrix spike duplicate data were solely used to judge the VOC data.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries

Matrix efficacy was monitored by MS/MSD analyses. An in-house sample at Pace underwent MS/MSD analyses for VOC. Therefore, direct application of these data was not possible. The method was shown to have been precise as the percent recoveries were within control limits established by Pace.

Sample W-041990-JM-04 underwent a matrix spike analysis for the metal analyte selenium, while sample W-041990-JM-06 had matrix spike analyses performed for metal analytes arsenic and zinc. All remaining metal analytes had matrix spike analyses performed upon in-house samples. Arsenic and selenium percent recoveries fell below the control limits set by Pace; therefore, the results for all samples for these analytes were qualified as estimated (UJ). As the percent recoveries for the remaining metals were within limits, the methods were shown to be accurate.

Laboratory Duplicate Analyses

The level of analytical precision for metals analyses was measured through laboratory duplicate analyses. The duplicate analysis for barium was performed upon sample W-041990-JM-02, while in-house samples at Pace were used for the remaining analytes duplicate analyses. Only lead analyses were shown to have an unacceptable level of precision. Therefore, all lead data were qualified as estimated (UJ).

Rinsate Sample

Cleanliness of sampling equipment was checked by collection of rinsate sample W-041990-JM-03. The only analyte detected within the sample was methylene chloride. However, this methylene chloride datum was qualified as non-detect (U) based upon the method blank sample. Therefore, the sampling equipment was properly cleaned prior to collection of samples.

Field Duplicate Samples

Overall precision of this sampling event was monitored by collection of field duplicate samples W-041990-JM-04 and W-041990-JM-05. Both samples were found to be free of all target analytes, indicating that an acceptable level of precision was achieved.

Overall Assessment

Methylene chloride data for sample W-041990-JM-01, W-041990-JM-02 and W-041990-JM-03 were qualified as non-detect (U) based upon method blank sample data. Metals analytes arsenic, lead and selenium had all results qualified as estimated (UJ). The remaining data were found to be acceptable for the quanitative assessment of analytes within the groundwater at the project site.

MEMORANDUM

TO: Steve Mockenhaupt REFERENCE NO.: 2853

FROM: Dave Dempsey DATE: August 1, 1990

RE: Data Quality Assessment and Validation for Seven Groundwater Samples Collected during the June 1990 Sampling Event at the Ford Site C Site

---

The following details a data quality assessment and validation for seven groundwater samples collected on June 6, 1990, at the Ford Site C site. Samples were analyzed for volatile organic compounds (VOC) and metals by Pace Laboratories Inc. (Pace).[1] Quality assurance criteria were established by analytical methods.[2]

Holding Time Periods

Holding time periods are established in analytical methods and are summarized below:

VOC - 14 days from sample collection to completion of analysis

Metals- 6 months from sample collection to completion of analysis, except for mercury
- 28 days from sample collection to completion of mercury analysis

Reviewing analysis dates showed that all holding time periods were met.

Method Blank Sample

Laboratory contamination of samples was checked for with method blank samples. The VOC method blank sample contained no target analytes. However, zinc was detected at a concentration of 0.066 mg/l within metals method blank sample. Zinc data for samples W-060690-RF-01, W-060690-RF-02, W-060690-RF-04 through W-060690-RF-06 were qualified as non-detect (U).

Surrogate Compound Percent Recoveries

Individual sample results for VOC analyses were assessed using surrogate compound fluorobenzene recoveries. Examining the recoveries revealed that VOC Method 602 was in control. No surrogate compound was used to check the accuracy of Method 601. Hence, MS/MSD recoveries were used to assess Method 601 results.

---

[1] Analytical methods are taken from 40 CFR Part 136, Appendix A, and "Chemical Methods for Analysis of Water and Wastes", USEPA-600/4-79-020, Revised March 1983 and are summarized below:

VOC - 40 CFR 601/602
Metals - USEPA 200 Series

[2] Application of quality assurance criteria was consistent with "Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses", February 1, 1988, and "Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses", July 1, 1988.

MN-COMP 0044792

Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries

Effects upon the data due to matrix interference were checked via MS/MSD analyses. Pace sample 21699 underwent VOC MS/MSD analyses. As all percent recoveries fell within limits, the level of precision was acceptable.

Sample W-060690-RF-07 underwent matrix spike analysis for target metals. The silver percent recovery was low. Therefore, silver data were qualified as estimated (UJ) for all samples.

Laboratory Duplicate Analyses

Precision for metals analyses was measured by means of duplicate analyses. Samples W-060690-RF-03 and W-060690-RF-06 had duplicate analyses for analytes mercury and selenium, respectively. Precision for both were acceptable. No other duplicate analyses were performed by Pace, therefore, field duplicate samples were used to assess precision.

Rinsate Sample

Cleanliness of sampling equipment was checked with rinsate sample W-060690-RF-01. Target VOC detected were 1,1,1-trichloroethane, tetrachloroethene and 1,1-dichloroethene. As all investigative samples were free of these analytes, no action upon the data was necessary.

Zinc was also detected within this sample. However, the zinc datum was qualified as non-detect (U) based upon the method blank sample.

Field Duplicate Samples

Precision was measured by collecting field duplicate samples W-060690-RF-04 and W-060690-RF-05. As both sets of data were within limits of agreement, the precision was acceptable.

Overall Assessment

Silver data were qualified as estimated (UJ) for all samples, while five samples had zinc data qualified as non-detect (U). Remaining data are acceptable to quantitatively assess target analyte concentrations.

Gentlemen:

SUBJ: Subsurface Exploration Program
Proposed Hazardous Waste Building
Ford Motor Plant
St. Paul, Minnesota
#120-12734

We have conducted a subsurface exploration program and foundation review for the referenced project. We are transmitting eight copies of our report. This work was done in accordance with your verbal authorization on October 22, 1984.

About 50% of the soil samples will be held at this office for one month and will then be discarded unless we are notified to hold them for a longer period of time.

We trust that this report will provide you with the needed information. If questions arise concerning interpretation of the data, please contact us for review.

Very truly yours,

Wilfred A. Wahl

REPORT OF SUBSURFACE EXPLORATION PROGRAM

PROPOSED HAZARDOUS WASTE BUILDING

FORD MOTOR PLANT

ST. PAUL, MINNESOTA

#120-12734

INTRODUCTION

We understand the proposed construction at this site will consist of a one-story, slab-on-grade structure. The building will be approximately 60' by 63' in plan dimensions.

In accordance with your verbal authorization on October 22, 1984, we have conducted a subsurface exploration program for the proposed construction. The scope of our work on this project is as follows:

1. Explore the subsurface soil and bedrock conditions by means of three test borings.
2. Provide recommendations for foundation support of the proposed building.
3. Provide recommendations for site preparation for support of the foundation.

Our work program for accomplishment of the above objectives included three soil test borings, a few laboratory tests and observation of the recovered soil samples.

MN-COMP 0044796

The purpose of this report is to describe our field operations, to present the results of our field and laboratory tests and to provide you with our engineering recommendations.

EXPLORATION PROGRAM RESULTS

Site Conditions

The building will be constructed south of the existing paint building. There is an existing storm sewer that runs in a north-south direction in about the center of the building. The site is relatively level with surface elevations at the boring locations varying from 95.2' to 95.9'.

Subsurface Conditions

The subsurface soil conditions encountered at the boring locations are shown on the attached boring logs. We wish to point out that the subsurface conditions at other times and locations on this site may differ from those found at our test locations. If different conditions are encountered during construction, it is necessary that you contact us so that our recommendations can be reviewed.

The test boring logs also indicate the probable geologic origin of the encountered soil.

It will be noted from the boring logs that shale was encountered at depths of from 3' to 6½' at the boring locations. The soil conditions overlying the shale were quite variable. Mixed alluvium consisting primarily of weathered

MN-COMP 0044797

limestone and some soil was encountered at boring 1. At boring 2, the soil consisted of sand with a little gravel, coarse alluvium. At boring 3, the overburden consists of fill.

The overlying soils generally are medium dense to very dense. The primary exception is the very loose sand encountered at a depth of about 5' at boring 2.

All of the borings terminated in shale. The shale is part of the Decorah Formation which is underlain with the Platteville Limestone Formation. Our geological data indicates the depth to the top of the Platteville Formation should be about 30' at this site. The shale contains lenses and thin layers of limestone. The borings were obstructed at depths varying from 8.6' to 15.7'. It is our opinion that the obstructions represents thin layers of limestone within the Decorah Formation rather than the underlying Platteville Formation. The N values in the shale vary from 13 to well over 100 blows per foot.

Water Levels

Water level measurements were made in the borings and the data is included on the logs. Ground water was encountered at borings 1 and 2 just above the underlying shale. Seasonal and yearly fluctuations of the ground water levels can be anticipated.

MN-COMP 0044798

ENGINEERING REVIEW

Project Information

The following data represents our understanding of the project. It comprises an important part of our engineering review. If, as the project develops, there are changes from the stated values, we request that you contact us for additional review.

We understand the proposed construction at this site will consist of a one-story, slab-on-grade structure. The building will be approximately 60' by 63' in plan dimensions. The building will be essentially a steel-frame metal clad building with concrete foundation walls supported on a concrete slab. The slab will be approximately 1' below existing grade. We anticipate the average loading under the slab, including live load, will be on the order of 500 to 600 psf (pounds per square foot).

Discussion

It is our opinion that the soils and underlying shale are capable of supporting the foundation loads with an adequate factor of safety against shear failure and with minimal settlement.

However, the shale is known to be expansive. No laboratory tests were conducted on samples from this site to further evaluate the expansive properties. However, based on previous tests on the Decorah Shale, the typical swell pressure would be on the order of 6 to 8 tons per square foot. Under very

MN-COMP 0044799

light loads, the percent swell is on the order of 3% to 4%. As a result, the swelling is most critical under the very light structures and especially under lightly loaded floor slabs.

For swelling to occur, the shale must come in contact with a source of water. At this particular site, ground water was encountered immediately above the shale at two of the boring locations. Therefore, it is quite probable that the upper portion of the shale has already undergone some swelling.

Therefore, supporting the lightly loaded structure on or immediately above the shale will entail some risk. However, the majority of the Ford Plant is supported on the shale. In many areas, the floor slab is only a short distance above the underlying shale. We understand that there have been no unusual problems with foundations or floor slabs in the existing plant due to swelling.

Therefore, based on this information, it is our opinion that the structure can be supported on a slab foundation above existing shale with only minimal risk of future excessive differential swelling.

Foundation Recommendations

Because of the wide variation in the composition of the soils (colluvium, alluvium and fill) immediately below the slab elevation, we suggest that the building area be subcut to a minimum depth of 18" below the bottom of

MN-COMP 0044800

the floor slab. Additional subcutting could be performed if localized fill is encountered extending to a greater depth. We then recommend placing a relatively clean, free-draining granular soil to the bottom of slab elevation. This fill should be compacted to a minimum of 95% of standard Proctor density. The slab can then be supported directly on the controlled fill at normal elevation. The excavation and compacted fill should extend beyond the edge of the slab a distance equal to the depth of compacted fill beneath the slab foundation.

Originally, it was planned to place a draintile system at the bottom of the granular fill. We recommend that no draintile be installed. We feel it is important to attempt to maintain the present moisture condition in the underlying shale, since a change in moisture content could cause a change in volume.

Site Observation

We recommend that the excavation be observed by a soil engineer before placing any newly compacted fill. We also recommend that density tests be taken in the fill as it is placed to document that proper compaction is being obtained.

FIELD EXPLORATION PROCEDURES

Three soil test borings were made on October 24, 1984. The borings were put down at the locations shown on the attached sketch. The locations were changed somewhat from the suggested locations because of material stored on

MN-COMP 0044801

the site and due to existing utilities. The surface elevations were referenced to the top of the hydrant where shown, taken as 100.0', an assumed elevation.

Soil Sampling

Soil sampling was performed in accordance with ASTM: D 1586-67. Using this procedure, a 2" O.D. split barrel sampler is driven into the soil by a 140 lb weight falling 30". After an initial set of 6", the number of blows required to drive the sampler an additional 12" is known as the penetration resistance or N value. The N value is an index of the relative density of cohesionless soils and the consistency of cohesive soils. Thin wall tube samples were obtained according to ASTM: D 1587-67 where indicated by appropriate symbol on the boring logs.

Soil Classification

As the samples were obtained in the field, they were visually and manually classified by the crew chief in accordance with ASTM: D 2487-83 and 2488. Representative portions of the samples were then returned to the laboratory for further examination and for verification of the field classification. In addition, selected samples were submitted to a program of laboratory tests. Logs of the borings indicating the depth and identification of the various strata, the N value, the laboratory test data, water level information and pertinent information regarding the method of maintaining and

MN-COMP 0044802

advancing the drill holes are attached. Charts illustrating the soil classification procedure, the descriptive terminology and symbols used on the boring logs are also attached.

EXPLORATION LIMITATIONS

The recommendations contained in this report represent our professional opinions. These opinions were arrived at in accordance with currently accepted engineering practices at this time and location. Other than this, no warranty is implied or intended.

III. INTRODUCTION, PROGRAM OBJECTIVES, AND STATEMENT OF POLICY

This Generic Quality Assurance (QA) Plan is written in compliance with the elements required in the U.S. EPA, "Guidelines and Specifications for Preparing Quality Assurance Program Plans." (QAMS-004 80, September 20, 1980). This document contains the required elements of a Quality Assurance Plan and is prepared in such a way that entire sections can be referenced in subsequent specific project plans. This Laboratory QA Manual defines the systems of quality control and quality assessment that constitute the comprehensive Quality Assurance Program at PACE, Inc. Quality Control consists of specific procedures applied to all phases of analysis from sample receipt through the final reporting of results. The purpose of quality control is to insure that quality goals are met under routine operating procedures. Quality assessment involves the continuous evaluation of data and monitoring of analytical processes for the purpose of insuring that the quality control systems are performing effectively.

PROGRAM OBJECTIVES

The major elements of the overall Quality Assurance Program are summarized below:

- Use of appropriate methodologies by technically competent, well-trained personnel with state-of-the-art instrumentation and equipment.
- Adherence to well-defined standard operating procedures with emphasis on good laboratory and measurement practices.
- Analysis and assessment of quality control samples including (but not limited to) matrix spike samples, duplicate samples, surrogate spikes, blanks, and independent laboratory control standards.
- Participation in external quality evaluation programs such as the EPA Water Pollution and Water Supply (WP & WS) Study Programs.
- Maintainance of accreditation by State, Federal, and other applicable agencies for work performed.
- Monitor internal and external compliance to procedures and to assess the performance of the analytical methods.

STATEMENT OF POLICY:

PACE, Inc. is committed to the policy of providing the highest quality product to its client. The validity and reliability of the information generated is maximized by the adherence to documented quality control procedures and quality assurance protocols. PACE emphasizes the application of sound quality assurance/quality control principles beginning with the initial planning of the project, through all the field and laboratory activities and ultimately to the generation of the final report. The principles of data quality objectives, representativeness, completeness, comparability, precision and accuracy are applied.

PACE is committed to providing the resources, including facilities, equipment and personnel, to ensure the adherence to rigorous QA/AC protocols. Individual Quality Assurance Project Plans are developed for monitoring analytical projects to conform with the established QA/QC protocols.

MN-COMP 0044819

IV. LABORATORY ORGANIZATION AND RESPONSIBILITY

The organizational structures for PACE, Inc. are provided in Exhibits 1, 2, and 3.

V. QUALITY ASSURANCE/OBJECTIVES

A. INTRODUCTION

The purpose of the plan is to define procedures for the documentation, evaluation, validation, and reporting of data. The objective is to provide a uniform basis for sampling, sample handling, instrument maintenance and calibration, methods control, performance evaluation and analytical data generation and reporting. Specific procedures to be used for sampling, chain of custody, calibration of field instruments (pH, conductivity meters, etc.), laboratory analysis, reporting, internal quality control, audits, preventive maintenance, and corrective actions are described in specific sections of this plan. This section addresses the objectives of accuracy, precision, completeness, representative, and comparability.

The QA objectives for precision and accuracy are to achieve the QC acceptance criteria specified in the proposed analytical procedures. For the organic and inorganic procedures, the precision and accuracy guideline requirements are specified in the individual methods.

Field Blanks and duplicates are collected and analyzed to assess field sampling activities. The results check procedural contamination and/or ambient conditions at the site.

Due to the extensive number of organic parameters and potential matrices, the development of precision and accuracy objectives and control limits for every matrix is difficult. This is typically done with (1) matrix spike and matrix spike duplicate compounds which are added to selected samples before extraction and analysis, and/or (2) surrogate spike compounds which are added to every sample, before extraction and analysis. Although the surrogate and matrix spike analyses do not provide statistically valid statements about precision and accuracy for every compound in a sample, they do give the data reviewer enough information to make judgements about precision and accuracy on a sample-by-sample basis.

Inorganic precision and accuracy data are determined by using duplicate samples (precision), matrix spike and laboratory control samples (accuracy). The following procedure is used:

For a duplicate sample analysis, at least one duplicate sample is analyzed per sample matrix type (e.g. water, soil) and concentration (e.g. low, medium) per batch of samples or for each 20 samples received, whichever is more frequent, or as specified by state/project requirements. Samples identified as field blanks can NOT be used for duplicate samples analyses. If two analytical methods are used to obtain the reported values for the same element for a batch of samples (i.e., ICP, GFAA), duplicate samples will be run by each method. The relative percent difference (RPD) for each component is calculated for later use during data assessment.

Completeness is a measure of all information necessary for a valid scientific study. For completeness, it is expected that the methodology proposed for chemical characterization of the samples collected will provide data meeting QC acceptance criteria for at least 90% of all samples collected. Completeness may also be defined as a comparison of the number of tests successfully completed (with acceptable QC) to the number of tests requested.

Representativeness is a qualitative element that is related to the ability to collect a sample that reflects the characteristics of that part of the environment that is to be assessed. Sample representativeness is dependent on the sampling techniques used and is considered individually for each project. It is specifically addressed in each work plan.

Comparability is also considered during preparation of the work plan. The objective of comparability is to ensure that results of similar activities conducted by different parties are comparable. For example, the use of EPA-approved or other methods and procedures ensures comparability with data from previous or following studies.

MN-COMP 0044825

VI. SAMPLING PROCEDURES

PACE, Inc. receives samples collected by clients and also has the capability to perform sampling for clients. PACE prepares sample containers in accordance with EPA-issued guidelines for container and preservative requirements. Technical assistance from all supervisory and management staff is available to clients if needed.

A. BOTTLE PREPARATION PROCEDURES

The following is the procedure used for Sample Container Preparation:

1. Purpose

The purpose of this Standard Operating Procedure (SOP) is to provide clear, consistent methods for preparing containers for sample collection. Following this procedure will facilitate accurate and consistent analytical results.

2. Application

The policies and procedures contained in this SOP are applicable to the personnel in the container preparation area.

3. General Policies

a. Always use new bottles when preparing containers for sampling (exception: One gallon, amber glass bottles used for transporting deionized water can be re-used after proper cleaning). These may be commercially-obtained precleaned bottles.

b. Always wear disposable latex gloves when handling sample containers.

c. Several preparation procedures require the use of acids as a preservative or cleaning agent.

   1. Be extremely careful when working with acids.

   2. Always wear safety glasses and a laboratory coat.

d. Bottle labels will list the preservatives added and the analysis to be performed, minimizing the probability for error.

e. When shipping pre-preserved bottles containing corrosives or oxidizers, consult proper DOT regulations.

4. Procedures: Containers for Aqueous Samples

a. Volatile Organic (VOA) Sample Container Preparation

1. Vial cleaning procedures.

a. Wash an entire package of vials in one washing session. Never store open packages of vials.

b. Soak the vials in cleaning solution (one capful of Acationox detergent, American Scientific, per sink of hot tape water) for 5 minutes.

c. After soaking, thrice rinse each vial thoroughly with hot tap water.

d. Thrice rinse each vial thoroughly with carbon filtered, deionized water (CFDI).

e. Stack rinsed vials in a drying tray (metal tray lined with aluminum foil, dull side exposed).

f. Bake the vials at 103°C for a minimum of four hours.

g. Cover baked vials with aluminum foil such that the dull side of the foil is in contact with the vials and set trays on a lab bench to cool.

2. Septum and cap cleaning procedures.

a. Clean entire packages of caps and septums. Do not store open bags.

b. Clean caps and septums separately.

c. The same procedures used for vial cleaning are used for cap and septum cleaning. Follow B through D in Section 1.

d. Spread evenly and thinly in drying trays to facilitate drying.

e. Dry for one hour at 103°C. Extended periods of heat can damage caps and septums.

f. Place clean caps and septums into a 1500 mL glass container which has been cleaned.

MN-COMP 0044827

3. Assembling VOA vials.

   a. Place ten clean vials upright in a vial box with dividers. Recover drying trays with foil after vials have been removed.

   b. Add 4 drops of concentrated hydrochloric acid (HCL).

   c. Add (10 mg/40 ml) 0.008% sodium thiosulfate if chlorine is present (e.g. drinking water).

   d. Assemble a cap by inserting a septum in the cap such that the Teflon (white) side is exposed to the interior of the vial.

   e. Cap each vial tightly.

   f. Repeat assembly procedures until all vials are capped.

b. **Semi-Volatile Container Preparation**

1. Glass, amber jars (250, 500, and 1000 mL) with Teflon lined caps are used to hold samples for semi-volatile analysis.

2. Bottles and cap liners are rinsed with reagent grade acetone. (Acetone is a target compound for EPA 8240 and an HSL compound. If acetone interferes with the analyses, use of hexane and/or methanol may be an alternative, as specified in the method.)

   a. Acetone is highly flammable and acetone vapors are toxic.

   b. When using acetone, wear latex gloves, safety glasses and work in a vented hood.

   c. Pour a small amount of reagent grade acetone in the bottle to be rinsed.

   d. Cap the bottle with a Teflon lined cap.

   e. Shake the bottle making sure the acetone comes in contact with all sides of the bottle and the cap liner.

   f. Empty the bottle, invert it on a drying rack and allow it to air dry.

   g. Cap the bottle with a rinsed cap.

   h. Attach a blue dot to the top of the cap indicating the container has been acetone rinsed.

MN-COMP 0044828

c. **Preparation of Containers for Metals Analysis**

1. Polyethylene bottles (125, 250, 500, and 1000 mL) with plastic caps are used to hold water samples to be analyzed for metals.

2. Add a small amount of 1:1 nitric acid to a bottle.

3. Cap the bottle and shake vigorously, being certain the acid comes in contact with all interior surfaces.

4. Empty the container.

5. Rinse the bottle and cap thrice with deionized water.

6. Add the appropriate amount of 1:1 nitric acid, cap, and place a pink or red dot on the cap to indicate the container contains nitric acid preservative.

Container Size	Quantity 1:1 Nitric Acid
125 mL	1/4 mL
250 mL	3/8 mL
500 mL	3/4 mL
1000 mL	1 1/2 mL

d. **Nutrient Container Preparation**

1. Polyethylene bottles (250, 500, and 1000 mL) with plastic caps are used to hold water samples for nutrient analysis.

2. Add the appropriate amount of sulfuric acid, diluted 1:1 from concentrate with carbon filtered deionized water, to each container.

Container Size	Quantity 1:1 Sulfuric Acid
250 mL	3/8 mL
500 mL	3/4 mL
1000 mL	1 1/2 mL

3. Attach an orange dot sticker to the cap of each prepared container.

MN-COMP 0044829

e. **Cyanide Container Preparation**

1. Polyethylene containers (1000 mL) with plastic caps are used to hold samples for cyanide analysis.

2. Add one gram (8 to 10 pellets) or concentrated solution of sodium hydroxide and one gram of ascorbic acid to each container. If chlorine is present in the sample, use only ascorbic acid.

3. Attach a green dot sticker to the cap of each prepared container.

4. Cyanide containers have a short shelf life; do not prepare in large quantities. (See #6b)

f. **Phenol Container Preparation**

1. Clear glass, small mouth containers (1000 mL) with "poly seal" caps are used to hold samples for phenol analysis.

2. Add 1 1/2 mL of sulfuric acid, diluted 1:1 from concentrate with carbon-filtered deionized water, to each container.

3. Attach an orange dot sticker to the cap of each prepared container.

g. **Oil and Grease Container Preparation**

1. Clear glass, wide-mouth containers (1500 mL) with foil lined caps are used to hold samples for oil and grease analysis.

2. 1000 mL amber glass containers with Teflon lined caps are acceptable.

3. Add five mL of 1:1 sulfuric acid to each container.

4. Attach an orange dot sticker to the cap of each prepared container.

MN-COMP 0044830

h. **Sulfide Container Preparation**

1. Polyethylene bottles (250 mL) with plastic caps are used to hold samples for sulfide analysis.

2. Add 0.5 mL of zinc acetate and NaOH (to pH greater than 9) to each container.

3. Attach a white dot sticker to the lid of each prepared container.

i. **Total Organic Carbon (TOC) Container Preparation**

1. Polyethylene bottles (250 mL) with plastic caps are used to hold samples for TOC analyses.

2. Add 0.25 mL of 1:1 sulfuric acid.

3. Attach an orange dot sticker to each prepared container.

j. **Radiological Containers Preparation**

1. Polyethylene bottles (one gallon) with wax coated, paper lined caps are used to hold samples for radiological analysis.

2. Add five mL of 1:1 nitric acid to each other.

3. Attach a pink dot sticker to the cap of each prepared container.

k. **CFDI Water Container Preparation**

1. One gallon, small mouth, amber glass bottles with Teflon lined caps are used to transport CFDI water.

2. These containers can be reused after appropriate cleaning.

3. Wash the bottle in hot tap water and Acationox detergent (American Scientific Products one cap of detergent per sink of water).

4. Thrice rinse the bottle with hot tap water.

5. Thrice rinse with CFDI water.

6. Bake the bottle at 103° until dry (at least four hours).

7. Remove the bottle from the oven, cover the mouth with foil, and let cool.

8. Cap the bottle with a new, Teflon lined cap.

1. **Other Container Preparation**

1. Polyethylene bottles (125, 250, 500, and 1000 mL) with plastic caps are used to hold samples for general chemistry analysis.

2. Clear glass bottles (125, 500, and 1000 mL) with foil lined caps are used to hold samples with high oil content to be analyzed for general chemistry parameters.

3. Amber glass, small neck bottles (500 mL) with Teflon-lined caps are used to hold samples for total organic halide (TOX) analysis.

5. **Procedure: Containers for Soil Samples**

a. **Volatile Organic Analysis Sample Container Preparation for Soil Samples**

1. Wide-mouth, amber glass vials (65 mL) with Teflon-lined caps are used to hold samples for volatile organic analysis.

2. The same preparations procedure is used as is used in preparation of VOA containers for aqueous samples except no preservative is added to the containers. (See #4a)

b. **Semi-Volatile Container Preparation**

1. Wide-mouth, amber glass jars (250, 500, and 1000 mL) with Teflon-lined caps are used to hold samples for semi-volatile analysis.

2. Preparation procedures are identified as those used in preparation of semi-volatile containers for aqueous samples. (See #4b)

c. **Inorganic Container Preparation**

1. Polyethylene bottles (125, 250, 500, and 1000 mL) with plastic caps are used to hold samples for inorganic analysis.

2. If the samples contain a large quantity of oil, clear glass jars (125, 500, and 1000 mL) with foil lined caps are used instead of the polyethylene bottles.

3. Container preparation procedures are identified as those used in preparation of general containers for aqueous samples.

6. Sample Container Quality Control and Lot Assignment

a. Bottles of a given type, prepared in one session, constitute a lot.

b. Lot sizes will vary, depending on the demand for a given bottle type.

1. A lot should be large enough to meet one week's demand for the given bottle type. Containers for samples to be analyzed for cyanide and VOA are exceptions.

2. Due to an extremely short shelf life, cyanide containers should be prepared in lot sizes required for approximately 2 days demand and prepared as necessary.

3. Due to spatial limitations, VOA vials should be prepared daily.

c. When a lot is prepared, it is assigned an eight character lot code.

1. The first two characters indicate the bottle type.

GN: General Unpreserved
MU: Metals Unfiltered
NT: Nutrients
CN: Cyanide
PH: Phenol
OG: Oil and Grease
SD: Sulfide
GV: GC VOA Water
GC: GC VOA Solid
GL: GC Q-Amber
GS: GC Sm Amber
GM: GC Misc. Refrigerated
HW: Hazardous Waste
OC: Total Organic Carbon
OX: Total Organic Halides
RA: Radiological

A complete listing of codes can be found in Section I of the LDMS User's Manual

2. The next three digits indicate the bottle size.

125: 125 mL
250: 250 mL
500: 500 mL
000: 1000 mL and one gallon

MN-COMP 0044833

3. The last three digits are the lot number. They are assigned in sequential order.

4. When the lot code is assigned, it is listed on the Lot Log Sheet (Exhibit 4).

5. The person who prepared the containers initials the Lot Sheet next to the lot code.

One container per lot is used to hold a deionized water blank. This blank is analyzed to determine the level of contamination in the lot.

- The appropriate analyses are performed for the given container type.
- Use carbon-filtered, deionized water for all blanks.
- Fill all containers, except VOA's, up to the neck of the bottle.
- Fill VOA's such that no bubbles are trapped when the vial is capped.
- Label each blank with the following information:

  Client: PACE, QC

  Sample description: (Lot Code)
  Date Collected:
  Collected by: (Initials)
  Time Collected:
  Analysis: (As indicated for the bottle type)
  Preservative: (Check appropriate preparation)

6. Complete a Chain-of-Custody form to accompany the samples. Client, sample description, time sampled, preservative, analysis: as listed on the bottle label.

   Report to: (Name of container preparation person)

   Project Name: Container QA

   Requested Due Date: Priority 2

   Matrix: H_2O

   Route samples and Chain-of-Custody to Sample Check-in.

EXHIBIT 4

LOT LOG SHEET

LOT #	INIT.	LOCATION				LOT #	INIT.	LOCATION			
		OUT	SHELF	TIER 1	TIER 2			OUT	SHELF	TIER 1	TIER 2

7. Sample Analysis Data Entry Form Tracking for Bottle Prep QC

Forms will be kept in an Outstanding QC file.

a. When a Report of Laboratory Analysis is received for the project, the Sample Analysis Data Entry Form is moved to the Complete QC file.

b. A copy of the Report of Laboratory Analysis is then routed to QC Data Entry and data are entered into the appropriate data base.

c. The data are reviewed by the supervisor of the Bottle Preparation Area and signed off as being certified "clean" if the following criteria are met. After subtraction of the daily DI water blank, all laboratory contaminants shall be less than 2 times the detection limit. If this criterion is not met, the bottles are re-cleaned and another blank analyzed.

The following are guidelines for the addition of sample preservatives to containers. Check the list of analyses to be performed and determine the types and sizes of containers needed and required.

Add the appropriate preservative to its designated container under a hood. Pack the bottles into a cooler with blue ice for the client.

PREPARING ACID PRESERVATIVES

All acid preservatives are prepared using a concentration of 1:1 acid to water. Reagent grade acids are used when making the 1:1 concentrations.

COMMON ANALYSES PRESERVATIVES

Analysis	Bottle Type	Preservative	pH	Approx. Amount
Metals	1 liter plastic	1:1 HNO_3	2.0	1.5 mL
EPA 602/8020	2 XVOA vials	1:1 HCl	2.0	3 drops
Cyanide	1 liter plastic	NaOH tablets	12.0	4-5 tabs
Sulfide	500 mL plastic	Zn acetate, NaOH	9.0	2 mL Zn acetate 2 tabs NaOH
Ammonia	1 liter plastic/ glass	1:1 H_2SO_4	2.0	1.5 mL
Phenolics	1 liter amber glass	1:1 H_2SO_4	2.0	1.5 mL

Sample containers, preservatives, and holding times for representative analytical groups are listed in Table 1. Refer to 40CFR 136 for complete information and details.

Technique

Instruments:
- GC — Gas Chromatograph
- GC/MS — Gas Chromatograph-Mass Spectrometer
- HPLC — High Performance Liquid Chromatograph

Detectors:
- ECD — Electron Capture
- Fluor — Fluorescence
- FID — Flame Ionization
- FPD — Flame Photometric
- HALL — Electrolytic Conductivity
- NPD — Nitrogen Phosphorous
- PID — Photoionization
- UV — Ultraviolet

Sample Preparation Method Used:
- EXT — Extraction Methods that could be used include 3510, 3520, 3540 and 3550.
- P&T — Purge and Trap
- 3510 — Separatory Funnel Extraction of Liquid Samples
- 3520 — Continuous Liquid-Liquid Extraction
- 3540 — Soxhlet Extraction of Solid Samples
- 3550 — Sonication Extraction of Solid Samples
- 5030 — Purge and Trap, Direct Injection of Liquid Samples, Solid Samples Mixed then Injected.

Sample Container/Preferred Volume:
- GA — Glass Amber Bottle with Teflon Lined Cap
- VOA — Volatile Organic Analysis; 40 ml Amber Glass Vial with Teflon Septum
- * — Contact Laboratory for recommendation

EPA/Holding Time:
- 7/40 — 7 Days for Extraction and 40 Days for Analysis
- ** — Depends upon Sample Matrix

NOTE:
The methods shown are those commonly employed in performing environmental analyses. It is not intended to be inclusive of all possible EPA analytical methods or to indicate that any laboratory routinely provides the methods or parameters shown.

MN-COMP 0044839

B. SAMPLING PROCEDURE FOR GROUNDWATER AND SURFACE WATER

Groundwater and surface water sampling techniques employed by PACE are in accordance with the EPA Regional IV Standard Operating Procedures and Quality Assurance Manual, and the PACE Field Services SOP Manual.

Trained field sampling crews are dispatched to the site for sample collection and deliver collected samples to the laboratory.

For groundwater sampling, the water level within the well is determined prior to sampling using an electronic water level meter, then recorded on the field log data sheet with all additional pertinent information (Exhibit 5). The volume of water in the casing is calculated and three to five times that volume is purged from the well. In all cases, the well is purged until the conductivity, temperature, and pH have all stabilized.

Samples from monitoring wells are taken with a precleaned Teflon or stainless steel bailer. Bailers are precleaned by washing first with detergent, then rinsed with tap water, triple rinsed with deionized water, and baked to dryness. Precleaned bailers are used between each sampling point.

All samples collected for metals analysis are preserved with nitric acid. The bailer to be used for sampling is used for purging two inch diameter wells and a gas-driven centrifugal pump is used when larger volumes of water need to be removed (static water levels of less than 25 feet). Wells with static water levels greater than 25 feet and casing diameters greater than 3 inches are purged using a submersible pump.

Quality Control Protocols:

A. All Quality Control (QC) procedures are as specifically required by the method, state, or project requirements.

B. The USEPA requires as a minimum one matrix spike, one duplicate or MSD, one blank, per set of samples of similar matrix with a maximum of 20 samples per set. This is a recommended minimum frequency for QC, unless stated otherwise by method, state or project requirements. A client may also request more frequent QC in which case it will be necessary to collect additional samples.

C. SAMPLING PROCEDURES FOR SOILS AND SEDIMENTS

Soil and sediments are collected according to procedures in the latest edition of Test Methods for Evaluating Solid Waste, EPA-SW-846.

Soil sampling is designed to determine the depth and range of contamination from spillage or the leaching effects of rain on materials stored above ground. If borings are required, the depth and placement of the borings are planned by the project manager/subcontractor and client, using the suspected range of contamination as a guide.

MN-COMP 0044842

VII. SAMPLE CUSTODY

A. SAMPLE RECEIPT

Sample shipments are received at the sample receiving area. Sample custodians verify the number of shipping containers received against the numbers listed on the shipping manifest/chain-of-custody. Any damage to the shipping containers or other discrepancy observed is noted on the chain-of-custody before signing it. A copy is kept for future reference.

The external chain-of-custody must be signed by the carrier for relinquishment of samples and signed by sample custodian personnel for sample receipt. The actual chain-of-custody may be supplied by PACE, (Exhibit 6), or may be the client's own form. The chain-of-custody remains in the project file at all times.

B. SAMPLE VERIFICATION

Upon arrival of a sample shipment, sample control personnel perform sample inspection. PACE's Sample I.D. and Condition Sheet (Exhibit 7) serves as a check-off list of procedures to follow and as documentation of the following:

1. Presence/absence of custody seals or tapes of the shipping containers and the condition of the seals (i.e., intact, broken).

2. Presence/absence of chain-of-custody; (if present, is it complete?)

3. Presence/absence of sample tags; (if present, are they removable?)

4. Agreement/non-agreement between the sample tags, chain-of-custody, and any client documentation.

5. Condition of the samples when received, including:

   - Cold or ambient
   - Intact, broken/leaking
   - Headspace in VOA vials
   - Sample holding time (has it been exceeded)?
   - Sample pH (less than 2 if acid preserved)

If discrepancies are found, the PACE project manager is contacted immediately (verbally and by using the Discrepancy Report Form) (Exhibit 8). If the project manager is not available, the QC manager is contacted for further directions. A copy of a Discrepancy Report Form is attached to the project data package.

SAMPLE CONDITION UPON RECEIPT CHECKLIST

Complete checklist (A) during sample receipt. If any items are marked "NO," complete section (B) of this form. Otherwise, go to record samples.

			YES	NO
(A)	1.	Are there custody seals or tapes on the shipping container?	___	___
	2.	Are custody seals on the shipping container intact?	___	___
	3.	Is there a completed Chain-Of-Custody (C-O-C)?	___	___
	4.	Do the numbers of samples received and the sample matrices agree with C-O-C?	___	___
	5.	Are there tags attached to each sample?	___	___
	6.	Are sample tags, sample containers and C-O-C all in agreement?	___	___
	7.	Is the C-O-C complete with requested analyses?	___	___
	8.	Are the samples preserved correctly?	___	___
	9.	Is there enough sample to do all analyses?	___	___
	10.	Do the samples have the proper temperature?	___	___
	11.	Are the sample containers intact (e.g., not broken, leaking)?	___	___
	12.	Are VOA vials head-space free?	___	___
	13.	Are all samples within the holding times for requested analyses?	___	___
	14.	Is pH recorded for non-VOA's?	___	___

(B) Explain "NO" item here: _____

_____

_____

Send a copy of this form to Project Manager with Discrepancy Report Form. Copy of both forms remain in the QC file.

C. SAMPLE LOG-IN

1. General Policies

a. Upon completing sample receipt/custody procedures, all sample and analysis data must be complete and documented on the chain-of-custody or accompanying forms for input into the Lab Data Management System (LDMS).

Sample and analysis data must include:

1. Client name and contact
2. Client number
3. PACE project number
4. PACE project manager
5. Sample descriptions
6. Due date
7. List of analyses requested

b. Sample and requested analyses data are input into the LDMS.

c. All samples received are logged into the LDMS on the day of receipt.

d. A Sample and Analysis Data Entry Form (SADEF) is generated immediately by the LDMS.

Distribution of SADEF:

- To the PACE Project Manager with a photocopy of the chain-of-custody. (Include a copy of the Discrepancy Report is applicable).
- To the QC project file with the original chain-of-custody.
- Photocopy to the Organic or Inorganic Department Manager as it applies for RUSH samples.
- To the client.

e. SADEF is to be reviewed against the chain-of-custody.

f. Sample containers are labeled with the corresponding sample number and the stamped date of receipt.

g. Samples are ready for storage.

MN-COMP 0044847

2. **When Samples Are Received With No Paperwork**

a. If delivered by a client: Client is asked if previous arrangements were made for analysis (and with whom). The client completes a chain-of-custody and/or request for analysis, relinquishes samples to sample custodian personnel, and is given a copy of the C-O-C.

b. If received by courier or shipping:

1st: Routine Client File is checked
2nd: Anticipate Sample Alert File is checked
3rd: Sampling Kit Request File is checked
4th: PACE key client contact is consulted
5th: QC department manager is consulted to determine the designated PACE project manager
6th: Information is requested from the PACE project manager.

c. If analysis information can not be determined on the day of sample receipt, sample data entry personnel proceed to assign sample numbers and put samples on hold. Follow-up with project manager occurs until the analyses are determined and samples can be properly logged in.

3. **Responsibilities for Sample Log In**

a. Quality Control Manager/Sample Management Officer

- Has the overall responsibility for ensuring that this procedure is implemented for all samples received into the laboratory.
- Has overall responsibility for ensuring that samples are logged in correctly (given that appropriate information has been supplied).

b. Sample Custodian

- Has the primary responsibility of ensuring that sample information is input into the LDMS as described in the SOP.
- Has the responsibility to make recommendations to the QC manager for revising the SOP.

D. SAMPLE STORAGE

1. General Procedures

Samples for analysis are properly stored in the lab according to container type, preservative, and type of security required by the project.

Samples are stored immediately upon receipt to prevent sample degradation.

2. Refrigerated Storage Area Maintenance

All refrigerated storage areas are maintained at 4°C + 2°C. The temperature is monitored and recorded daily. If the temperature fails outside the limit of 2° to 6°C, corrective action is to be taken as follows and appropriately documented.

a. Temperature is monitored at 30 minute intervals with the refrigerator door closed.

b. QC Manager is notified if the problem persists longer than one hour.

c. Samples are relocated to a proper storage environment if temperature cannot be maintained after corrective actions are implemented.

3. Routine Sample Storage

a. General Samples

Samples within each project are stored in sample number order. Waters and soils are generally stored on labeled separate shelves.

4. Specific Procedures

a. Volatiles

Samples within a project are stored in numerical order in vial containers. The holders are then stored where space permits in one of the designated volatile organic refrigerated storage areas.

b. Semi-Volatiles

Samples within a project are stored in numerical order in a designated, refrigerated storage area.

MN-COMP 0044849

c. Hazardous Materials

Pure product or potentially heavily contaminated samples are tagged as "hazardous" and stored within a secured area, separate from other samples. This area is used only for hazardous samples and is labeled per OHSA requirements.

d. Special Projects

- Volatiles

  Samples within a project are stored in sample number order in vial containers. The holders are then stored as space permits in the Special Project VOA refrigerated storage area.

e. Asbestos

No refrigeration required. Samples are taken to asbestos lab for storage.

5. Responsibilities for Sample Storage

a. QC Department Manager/Sample Management Officer has direct responsibility for ensuring that the SOP is followed, samples are stored properly upon receipt, and refrigerated storage area temperatures are maintained.

b. Sample custodians are responsible for storing all samples upon receipt into the appropriate storage area, maintaining high level security for those samples under custody, and for keeping a current custody sample inventory.

c. Analytical personnel have the responsibility of daily sample storage area maintenance, disposal of old samples, and providing space for incoming samples in routine storage areas.

d. Assigned individuals are responsible for maintaining and documenting: (a) refrigerated storage area temperatures, and (b) corrective actions.

See temperature log (Exhibit 9).

Exhibit 9

TEMPERATURE LOG FORM

Storage Area No. _____

Date	Temperature	Initials	Corrective Action/Comments

Note: Temperature must be $4^{o}C \pm 2^{o}C$. If temperature is outside the limit of 2^{o} to 6^{o} continue to monitor at 30 minute intervals (door must remain closed). If no correction within one hour, notify the QC Manager.

MN-COMP 0044851

F. SAMPLE/DATA ACCESS AND INTERNAL CHAIN-OF-CUSTODY

1. General Policies and Procedures

PACE has implemented standard operating procedures to assure the integrity of samples and data so that they are not degraded or disclosed to unauthorized personnel. In order to ensure that this policy is maintained, the laboratory facilities are under controlled access. Only employees are allowed into the laboratory facilities; visitors must register at the front desk.

Samples are removed from their proper location by the analyst and returned to the storage area immediately after the required sample quantity has been taken. This minimizes unnecessary time spent searching for samples and helps prevent matrix degradation from prolonged exposure to room temperature. Most samples are retained in storage in their original locations for approximately two months. Preserved metals samples and hazardous waste samples are stored up to six months. After the final report is sent and clients are allowed adequate time to review the results, the samples are properly discarded or returned to the client.

PACE normally completes the sample analysis within 15 working days after receipt. Holding times may require faster turnaround times.

Upon client request, additional and more rigorous chain-of-custody protocols for samples and data can be implemented. For samples involving a high degree of confidentiality or potential litigation, PACE, Inc. has developed extensive sample and data handling protocols to assure the scientific and legal defensibility of the report submitted. These protocols include those specified by the USEPA Contract Laboratory Program.

Analysts and technicians follow strict internal chain-of-custody procedures to further ensure the validity of all data. All samples are signed out in a sample custody log book when they are removed for analysis. The sample ID, date, time, analyst, and lab of analysis is recorded in the sample custody log (Exhibit 10). Samples are signed back in noting date, time, and storage location, upon return.

Date & Time Removed	Sample Nos. Removed	Name	Witness	Time Returned	Name	Witness

REMINDER: Samples must be returned at the end of the shift.

MN-COMP 0044853

2. Responsibilities for SOP Compliance

a. The QC manager has the overall responsibility for ensuring that the SOP is implemented and followed.

b. The sample custodian personnel have the responsibility for ensuring that the SOP is properly followed, and to notify the QC manager of problems.

c. All employees checking out samples are required to follow procedures.

G. EXCESS SAMPLE DISPOSITION

Samples not totally consumed during the analyses are returned to the client. It is the project manager's responsibility to ensure that proper disposal has taken place. If the sample is water or wastewater and is considered non-hazardous by the project manager, it may then (by request) be properly disposed of at PACE facilities and not returned to the client.

1. Notification of Sample Return

The project manager and client receive written notification at the time of project initiation in the following manner:

a. The project proposal states the following paragraph in its Conditions and Terms Statement:

PACE, Inc. Standard Operating Procedures is to return all samples of hazardous materials or wastes to the client at project completion, and PACE, Inc. reserves the right to return or dispose of all samples at our discretion.

This is a standard form used by PACE's Marketing Department.

b. The Sample and Analysis Data Entry Form states the following sentence:

- PACE, Inc. reserves the right to return all samples at our discretion.
- This form is printed out by the LDMS at sample check-in.

c. The Sample and Analysis Data Entry Form cover letter will state the following paragraph:

1. PACE, Inc. Standard Operating Procedure is to return all samples of hazardous materials or wastes to the client at project completion. PACE, Inc. reserves the right to return or dispose of all samples at our discretion. (Exhibit 11)

2. This is a pre-printed cover letter that accompanies the Sample and Analysis Data Entry Form.

d. The Sample and Analysis Data Entry Form and cover letter is sent to the project manager and to the client by the sample custodian personnel.

2. **Sample Return and Disposal**

Upon completion of laboratory analysis and/or the project, the LDMS automatically prints a report, invoice and sample disposition form. This form is part of the report package and is routed to the project manager.

a. The Sample Disposition Form (Exhibit 12) contains the following information:

1. Client name, address, and contact
2. PACE project number
3. Client project identification number
4. PACE sample identification number
5. PACE project manager name

November 1, 1989

Dear Valued Client:

A new policy has been implemented in the Sample Receiving Department of PACE Laboratories, Inc. We hope that this policy will be helpful to you.

Upon receipt of samples into the laboratory, the Sample Custodian completes a Sample and Analysis Data Entry Form. This form is designed to accommodate a short description of the samples received (sample name and/or sample reference), the type of container, and a list of the analyses requested to be performed on each sample. A copy of this form will be sent to the client (submitter).

Enclosed is a copy of the Sample and Analysis Data Entry Form relevant to the samples we recently received from you. Please compare the information on the form to assure that it is consistent with your request. If there is any inconsistency or if you have any questions on your project, please call the PACE Contact indicated on Sample and Analysis Data Entry Form. The PACE Contact has primary responsibility for monitoring the progress of your project through the laboratory.

It is also part of PACE Laboratories, Inc. Standard Operating Procedure to return all samples pertaining to the information attached that are hazardous materials or hazardous wastes to the client at project completion. PACE Laboratories, Inc. reserves the right to return or dispose of all samples at our discretion.

We have implemented this procedure to better serve our clients, and would appreciate any comments you may have.

Sincerely,

MN-COMP 0044856

Vice President, Corporate Quality

Dear_____:

All requested analyses of the samples for the above referenced project have been completed. Enclosed are the remaining portions of the samples which are being returned to you for final disposition.

If you have any questions, please call me.

Sincerely,

_____
Project Manager

MN-COMP 0044857

3. Procedure for Use of the Sample Disposition Form

a. The project manager separates the sample disposition form from the report package, signs the form, and routes it to the sample custodian. If the sample is water or wastewater and non-hazardous, the project manager may wish to properly dispose of the waste.

- If the project requires, the project manager may hold the form for an acceptable amount of time before return or disposal.

- It is important that this form be used and not discarded. It is part of the internal chain-of-custody and is filed with the project report.

- The project manager will use action codes such as:

  1 = Return to client 2 = In house disposal
  C = Clean D = Dirty

  As a general rule, soil samples will be returned and water samples will be disposed of in-house. Water samples which are highly contaminated will be returned. Preserved samples, VOA's, and extracted/tainted samples will not be returned to the client. Therefore, it is necessary to note clean or dirty to facilitate handling. If a sample has an extremely high level of contamination, note the contaminant.

  For In-House Sample Disposal

  All preserved - Clean - Neutralize/sink
  Dirty - Toxic waste

  Un-preserved water - Clean - Sink
  Dirty - Toxic waste

  Soil/Sludge - Clean - Trash
  Dirty - Toxic waste

  All VOA's - Clean - Neutralize/sink
  Dirty - Toxic waste

MN-COMP 0044858

All Extracted/Tainted Samples

CAM Extracts - Clean - Neutralize/sink
Dirty - Acid metals waste

Other Extracts - Toxic waste

Liquid/Unknown Misc. - Project manager specify

- Project manager will complete the sample disposition form and route it back to invoicing.
- The invoicing department will put completed sample disposition form in sample control mailbox.

b. Upon receipt of the Sample Disposition Form by the sample custodian personnel, the custodian personnel will remove the samples from storage using the information provided on the form.

- If the Sample Disposition Form indicates "Dump," the sample custodian personnel will remove them from storage and place them at a sample disposal station for proper disposal. The process of disposal is performed by the sample custodian personnel or appropriate laboratory staff. The Sample Disposition Form is signed and dated by the sample custodian personnel, then routed to the file clerk for filing with other project information.
- If the samples are to be returned, the sample custodian removes the sample or samples from storage, initials and dates the Sample Disposition Form. The samples, the Sample Disposition Form, and a copy of the client's chain-of-custody are then delivered to the shipping clerk by the sample custodian for return to the client.

c. Upon receipt of the samples and Sample Disposition Form, the shipping clerk signs and dates the form.

The Sample Disposition Form is copied and the original form with the samples is returned to the client, along with a copy of the client's chain-of-custody. A copy of the Sample Disposition Form and the original chain-of-custody is routed to the file clerk for filing with other project information (QC file).

MN-COMP 0044859

- The shipping clerk labels the box with an appropriate hazard label and ships the samples back to the client using UPS or any other requested manner for shipment. (Note: It is important for proper packaging to prevent breakage during shipment.)

- All shipping costs will be charged against the appropriate project number.

d. Upon receipt of Sample Disposition Form, the file clerk files it with other project related information.

4. Hazardous Material/Waste Sample Disposition Option

The preferred method for disposition of excess hazardous material/waste samples is to return the excess sample to the client. It may not be feasible to return samples in all cases or the client may require PACE to dispose of excess samples. PACE will dispose of excess hazardous samples when required and will charge a disposal fee to recover costs for management and disposal.

Procedure for Disposal Option for Excess Hazardous Material/Waste Samples:

a. The project manager informs the client that excess sample disposal will require an additional charge.

b. When analyses are complete, the project manager indicates disposal as the option on the Sample Disposition Form and completes and attaches Hazardous Material/Waste Disposal Option Form (Exhibit 13). An entry is to be made in all fields of this form as it will determine the basis for lab packing and disposal.

c. The project manager routes the Disposal Option Form to sample check-in.

d. The project manager is responsible for billing the client for disposal.

e. The sample custodian is responsible for maintaining a file of Disposal Option Forms for all samples awaiting disposal. Hazardous material/waste samples are stored in safe manner, segregated by compatibility groups as indicated by the hazardous waste disposal SOP.

f. The Quality Control Manager is responsible for reviewing accumulated samples awaiting disposal and initiating the disposal process when warranted. The Field Services, Inorganic, Organic, and Environmental Services Departments cooperate and participate in the disposal process. (For compatibility and compositing, see the Hazardous Waste Disposal SOP.)

MN-COMP 0044862

VIII. CALIBRATION PROCEDURES AND FREQUENCY

Most measurements taken in the laboratory are based upon comparison to reference standards as analyzed by the standard method. The standard results are utilized to generate calibration curves or calibration factors. The results of the sample analysis are then quantified.

All instruments are calibrated using standard solutions of known concentrations. The standards are prepared from certified reference materials and are generally traceable back to NIST. Refer to Section XI for additional information.

Continuous calibration is verified by analysis of calibration standards or laboratory control samples from different sources at regular intervals. Recalibration is performed at specified time intervals or when indicated by the continuous verification procedure or as required by the method. Typical acceptance criteria for some common organic analyses are summarized in Table 2.

Forms to document initial and continuing calibration have been developed (Exhibits 14 and 15).

Refer to Section IX for additional calibration information and frequency as specified in the specific analytical methods.

MN-COMP 0044863

TABLE 2 CALIBRATION AND QC ACCEPTANCE CRITERIA[a] FOR HALOGENATED VOLATILE ORGANICS

Parameter	Range for Q (ug/L)	Limit for s (ug/L)	Range for X (ug/L)	Range P, P_s (%)
Bromodichloromethane	15.2-24.8	4.3	10.7-32.0	42-172
Bromoform	14.7-25.3	4.7	5.0-29.3	13-159

Q = Concentration measured in QC check sample, in ug/L.
s = Standard deviation of four recovery measurements, in ug/L.
$\bar{X}$ = Average recovery for four recovery measurements, in ug/L.
P, P_s = Percent recovery measured.
D = Detected; result must be greater than zero.

[a]Criteria from 40 CFR Part 136 for Method 624 and were calculated assuming a QC check sample concentration of 20 ug/L. These criteria are based directly upon the method performance data in Table 7. Where necessary, the limits for recovery have been broadened to assure applicability of the limits to concentrations below those used to develop Table 7.

IX. ANALYTICAL PROCEDURES

Analytical methods employed at PACE can be EPA methodologies from the Federal Register and SW 846 (References 2 and 3) or approved equivalent methods. When there is no approved EPA method, industrial methods are used. A list of analytical methods utilized at PACE is as follows:

A. LIST OR ANALYTICAL METHODS

1. Organic Analyses

Parameter	Method	DW	WW Method	SW 846	Spec.
Purgeable Halocarbons	GC	502.1/502.2	601	8010	
Non-Halogenated Volatile Organics	GC			8015	
Purgeable Aromatics and Unsaturated Organics	GC	503.1/502.2	602	8020	
Acrolein & Acrylonitrile	GC		603	8030	
Phenols	GC	515.1	604	8040	
Benzidines	HPLC		605		
Phthalate Esters	GC		606	8060	
Nitrosamines	GC		607		
Organochlorine Pesticides and PCBs	GC	508/505/508A 507/515.1	608/608.1 608.2	8080	CA Mod 8080 MN. 570A
Nitroaromatics and Isophorone	GC		609	8090	
Polynuclear Aromatic Hydrocarbons	HPLC/GC	502.2/503.1	610	8310/ 8100	
Haloethers	GC		611		
Alachlor, Atrazine, Chlordane, Hepatchlor, Heptachlor Epoxide, Lindane, Methoxychlor, Toxaphene, and PCBs (as Aroclors)	GC	505/507	645		MN 570A

MN-COMP 0044872

Parameter	Method	DW	WW Method	SW 846	Spec.
Chlorinated Hydrocarbons	GC		612	8120	
2, 3, 7, 8 - TCDD	GC/MS		613		
Volatile Organics					(MN)465C
Base/Neutrals & Acids	GC/MS	525 (NCA)	625	8250/8270	
Organophosphorus Pesticides	GC	507	614/622	8140/ 8220	(MN)570A (CA)AB1803
Chlorinated Herbicides	GC	515.1	615/608.1/ 608.2	8150	(MN)574A (CA)509B
EDB and DBCP	GC	504			(CA) DOHS
Volatile Organic Compounds	GC/MS	524.2/524.1	624	8240	
Carbamates & Urea & Pesticides	HPLC	531.1	632		(CA)AB1803 (MN)572A
Fuel Hydrocarbons & BTEX	GC		602	8020	(CA) Mod. 8015
Alachlor, Atrazine	GC	507/505	619/645		(CA)AB1803 (MN)570A
Chlordane, Heptachlor, Heptachlor Expoxide, Lindane; Methoxychlor	GC	508/505	608/617	8080	
Aldicarb; Aldicarb sulfone; Aldicarb sulfoxide; Carbofuran	GC	531.1			(CA)AB1803

3510	Separatory Funnel Liquid - Extraction
3520	Continuous Liquid - Extraction
3540	Soxhlet Extraction
3550	Sonication Extraction
3580	Waste Dilution
5080	Purge and Trap
3005	Acid Digestion of Waters for Total Recoverable or Dissolved Metals for Analysis by Flame AA or ICP
3010	Acid Digestion of Aqueous Samples and Extracts for Total Metals for Analysis by Flame AA or ICP
3020	Acid Digestion of Aqueous Samples and Extracts for Total Metals by Furnace AA
3050	Acid Digestion of Sediments, Soils, and Sludges

Method numbers refer to EPA Methods except:

1. S.M. = Standard Methods for the Examination of Water and Wastewater
2. USATHAMA = U.S. Army Toxic and Hazardous Materials Agency
3. NIOSH = Manual of Analytical Methods
4. Hach, Chevron, Calgon = Industrial Methods

B. **GAS CHROMATOGRAPHY PROCEDURES**

1. **Calibration and Calibration Verification**

All GC methods are calibrated by external calibration procedures using three to five standard concentrations, depending upon the method. A new calibration is performed at least once per month or as needed on routine analyses. Methods not utilized on a daily basis are calibrated before each run.

2. **Laboratory Control Sample (LCS)**

An EPA check sample is analyzed at least once per week, and when a new initial calibration is performed.

3. **Matrix Spike**

Performed at a minimum of every 20 samples or as required by either state or project-specific requirements.

4. **Surrogate Spike**

Surrogates are added to and analyzed for in every sample for methods 601, 602, 8010, 8020, 608, 8080, 8015, 615, 8150.

MN-COMP 0044881

5. **Duplicate Sample Analysis**

Performed at a minimum of every 20 samples or as specified by state/project requirements. Many samples contain non-detectable amounts of the parameters to be measured, therefore, the matrix spike is duplicated. (Matrix Spike Duplicate)

6. **Blank Analysis**

The reagent/method blank must have no contaminants greater than the detection limit of the method. In the case of volatile organic analysis, common laboratory solvents may be present at a concentration of less than 5 times the MDL. Blank subtraction is normally not allowed by contract/project protocols, unless specified by terms of the contract/project.

7. **Other**

Method 608/8080 are also subject to the following QC criteria:

a. Combined breakdown of endrin and DDT may not exceed 20%. This is monitored through the daily analysis of an LCS containing these compounds.

b. Two LCS (each containing 1/2 the compounds of the method) are alternately analyzed after every tenth sample.

C. **GAS CHROMATOGRAPHY/MASS SPECTROMETRY PROCEDURES**

1. **Calibration and Continuing Calibration**

An internal three point calibration is performed when indicated by the continuing calibration. One check standard is analyzed at the beginning of each 12-hour shift to verify calibration. The acceptance limit for the check standard is 25% RSD. Recalibration is necessary from once per week to once per month. Fresh calibration standards must be prepared weekly.

2. **Validation of Mass Spectrometer**

The mass spectrometers are tuned at the start of each run period and at 12-hour intervals. The tuning procedure utilizes the EPA recommended compounds 4-bromofluorobenzene (BFB) for 624/8240 and decafluorotriphenyl phosphine (DFTPP) for 625/8270.

MN-COMP 0044882

3. **Internal Standards**

All sample results are quantified using the internal standard technique described in EPA methods 624, 8240, 625, 8270. Three (VOA) or six (BNA) internal standard compounds are added to each sample immediately before analysis. The internal standard nearest the retention time of the analyte of interest is used in the quantitation of the analyte.

4. **Laboratory Control Sample**

An EPA check sample is analyzed at a minimum once every month. A standard is run every 12 hour shift.

5. **Matrix Spike and Matrix Spike Duplicate**

Performed at a minimum of every 20 samples or as specified by state/project requirements. This is the same procedure as the GC section.

6. **Surrogate Spikes**

Surrogate spiking compounds are added to and analyzed for, with every sample. A surrogate is a volatile sample prior to purging and prior to extracting a semi-volatile sample.

7. **Reagent/Method Blank**

VOA - one per 12-hour per shift
BNA - one per batch of samples extracted

Common laboratory solvents present in the blank at a concentration less than 5 times the MDL will be footnoted on the analysis report. Common solvents at greater concentrations or the presence of any contaminant not considered a common laboratory solvent at a concentration greater than the MDL indicates the need to re-extract/re-analyze the blank and associated samples.

D. **METALS PROCEDURES**

1. **Calibration and Calibration Verification**

All instruments are calibrated at the start of each run. The graphite furnace requires 4 point calibration. The Flame AA and ICP methods utilize a minimum of 3 points. Cold vapor analysis of mercury requires a 5 point calibration. Recalibration is performed after 50 samples, or more often if indicated by the laboratory control sample.

MN-COMP 0044883

2. Laboratory Control Sample

Performed at a minimum of every 20 samples, or as specified by state/project requirements.

3. Matrix Spike

Performed at a minimum of every 20 samples, or as specified by state/project requirements.

4. Duplicate Samples

Performed at a minimum of every 20 samples, or as specified by state/project requirements.

5. Blank Analysis

a. Method Blank

If the concentration of the blank exceeds the MDL, all samples associated with the blank are redigested and reanalyzed concurrent with a new blank. Samples with a concentration greater than 10 times the blank are reported, without blank value correction.

b. Reagent Blank

Any reagent blank result greater than the MDL terminates the analysis until corrective action resolves the problem. For ICP metals, a negative blank value greater than two times the MDL also requires corrective action. In rare cases, if all corrective action fails to resolve the problem and the blank value still hovers at 1-3 times the MDL, the analyst may run the samples, report all values greater than 10 times the blank value, and correct the sample values less than that amount for the blank value.

E. GENERAL CHEMISTRY PROCEDURES

1. Calibration and Verification

All instruments are calibrated daily with 3-6 point curves, depending upon instrument requirements. The calibration is continuously verified throughout the run, with either a calibration standard or laboratory control standard inserted after every 10th sample.

2. Laboratory Control Sample

A laboratory control sample is analyzed at least once during each batch of samples.

3. Matrix Spike and Duplicate Samples

Performed at a minimum of every 20 samples, or as specified by state/project requirements.

F. RECORD KEEPING AND REVIEW

All records and data are stored in safe places such as metal cabinets or hard cover bound books.

The extractions section utilizes method-specific bound books to record all data pertaining to sample extraction and preparation. A copy of the extraction benchsheet is transferred to GC or GC/MS with each extracted sample (Exhibit 16 and 17).

The organic and inorganic departments utilize benchsheets, maintained by analysts; specific for injection data and instrument maintenance. Spectras and chromatograms are filed by acquisition date.

The individual analysts and technicians are responsible for maintaining accurate, legible records and logs in accordance with standard operating procedures. The supervisors are responsible for ensuring adherence to procedures.

Secondary review of all records and logs is performed periodically by someone other than the person generating the document, preferably the department supervisor. Evidence of secondary review is provided on the document as initials and review date by the secondary person.

See Section X for magnetic media storage.

G. ACCEPTANCE LIMITS AND CONTROL CHARTS

Acceptance criteria for quality control samples and instrument calibration/verification are summarized in Table 3.

TABLE #3

ACCEPTANCE CRITERIA FOR QUALITY CONTROL SAMPLES & INSTRUMENT CALIBRATION

	MATRIX SPIKE % RECOVERY	SURROGATE SPIKE % RECOVERY	RPD DUPLICATE SAMPLES	INITIAL CALIBRATION LINEARITY	CALIBRATION VERIFICATION	LCS/EPA QC SAMPLE
GC	Within calculated control limits*	Within calculated control limits	≤ maximum RPD acceptance limit	RSD ≤ 20%	± 15% of true value or initial response	±15% of true value or EPA limit
MS	Within calculated control limits*	Within calculated control limits	≤ maximum RPD acceptance limit	RSD ≤ 30%	± 30% of initial average RF	± 15% of true value or EPA limit
GENERAL CHEMISTRY	Within calculated control limits*	N/A	0-67 on samples < 10x MDL 0-20 on samples > 10x MDL MDL = Method Detection Limit	Correlation coefficient ≥ .995	± 10% of true value	± 15% of true value or EPA limit
METALS	Within calculated control limits*	N/A	0-67 on samples < 10x MDL 0-20 on samples > 10x MDL MDL = Method Detection Limit	Correlation coefficient of: ≥ .995 ≥ .995 :AA ≥ .995 :Cold Vapor	± 10% of true value	± 15% of true value or EPA limit

* Establishment and Utilization of Acceptance Limits

MN-COMP 0044889

X. DATA REDUCTION, VALIDATION AND REPORTING

Final results are entered into the LDMS system by the analyst, independently validated, and reviewed by the department supervisor for verification (Exhibit 18).

Result verification sheets are attached to the QC files and reviewed by the QC manager. After QC file review by the QC manager, the department manager verifies the completeness and the validity of the report. When all required analyses on all of the samples in a project are complete, entered and verified, a report is generated. The report goes to the project manager for review. Each project is assigned to a project manager after samples are received at PACE. The project manager is responsible for tracking sample progress while in-house and ensuring timely analysis.

When the data re complete, the project manager reviews the final report according to these criteria:

- Reasonableness of data, i.e., whether the various sample analyses results make sense when compared to each other. Analyses such as BOD, COD, amount of organic contamination, general mineral balances, volatile organics measured by different methods, pH and electrical conductivity, and other analytical interrelationships are compared. Data on samples within the same project number are compared and if descriptive information about the samples is available, then it may be concluded that the results are reasonable in comparison to each other.

The report requires the signature of the project manager and the department manager. Client questions about the final report may be directed to these individuals or the Client Services manager when appropriate.

- Data Storage

  Data and reports are archived onto computer tape and written in documents for either off-site storage within a secured building, or within a locked storage cabinet.

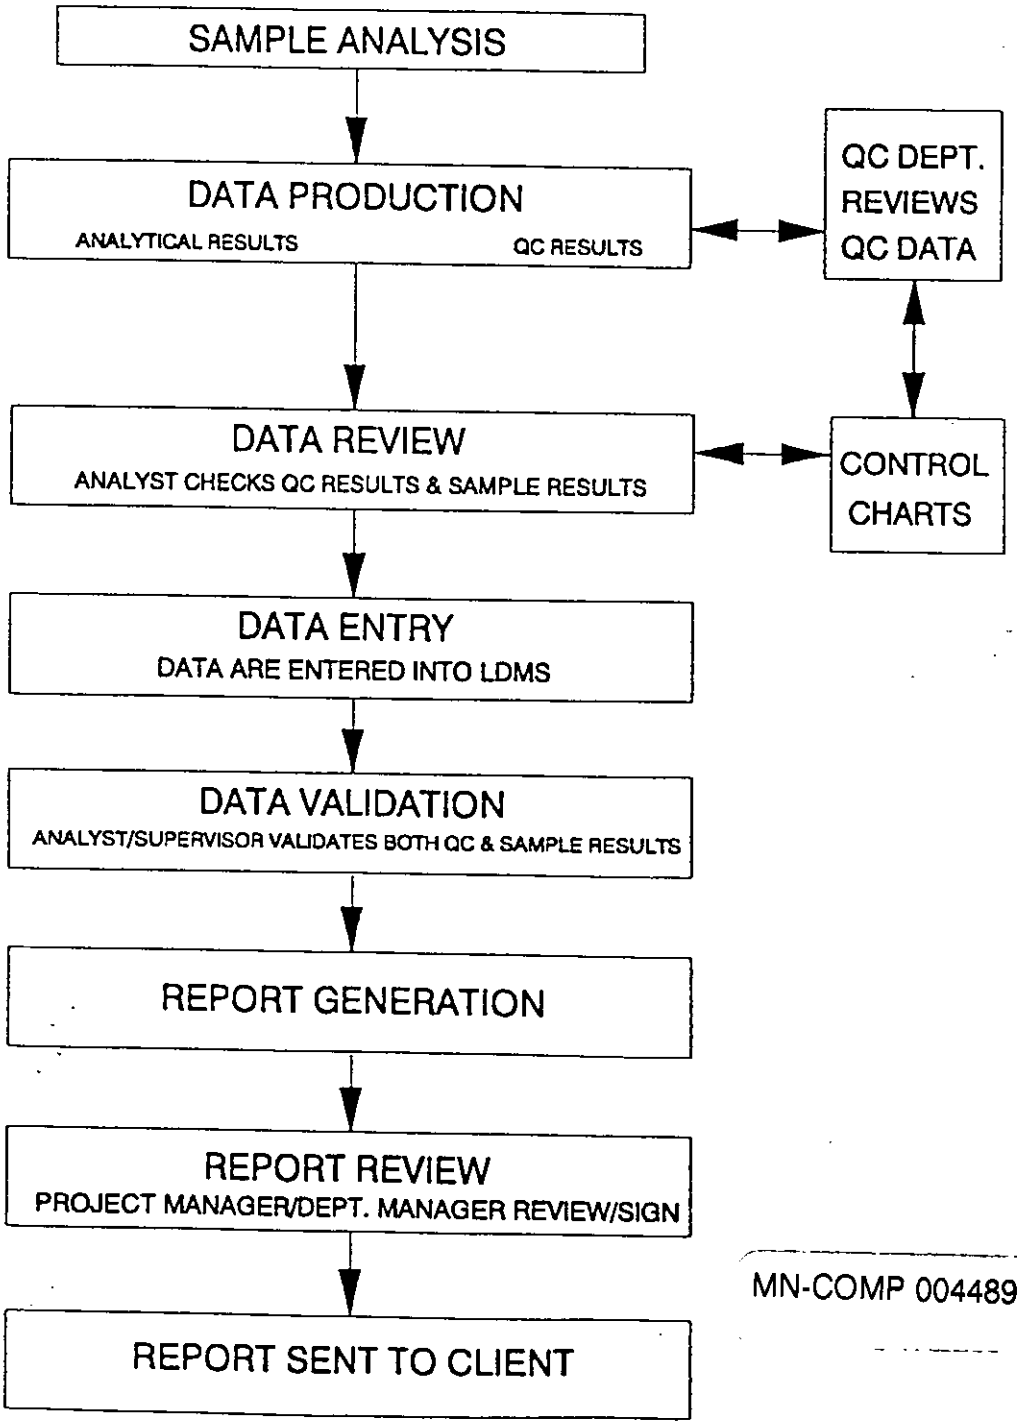
EXHIBIT 18

LABORATORY DATA FLOW CHART



MN-COMP 0044891

XI. INTERNAL QUALITY CONTROL

The Quality Assurance Plan is a document that reflects the actual operating and quality control programs in use at PACE. The reliability and credibility of analytical results is established by inclusion of a program of randomly scheduled replicate analyses, analysis of standard of spiked samples, and the cooperative analysis of split samples by several laboratories. These quality control checks are an integral part of the sampling and analytical plan.

Quality assurance, as practiced at PACE, consists of general quality control and assessment procedures that are adapted to the specific operating conditions within each section. The general elements of quality control are outlined below.

A. BLANK ANALYSIS

Reagent/Method Blanks: A reagent blank consists of laboratory pure water and any reagents added to a sample during analysis only, or straight solvent. A method blank is a water or soil blank which undergoes all of the preparation procedures applied to a sample (i.e., extraction, digestion).

It is standard policy throughout the laboratory to prepare and analyze a reagent or method blank (whichever is appropriate) with each sample batch. Separate water and soil method blanks are prepared for mixed matrix batches.

Reagent blanks may also be inserted at regular intervals on large (20 samples) batches, or after highly concentrated samples to check for carryover/contamination. For methods utilizing surrogate compounds, the surrogates are added to all blanks and are subject to meeting acceptance criteria.

A trip blank is submitted for analysis with most samples analyzed for volatile organic compounds. A field blank or procedure blank may also be submitted at the discretion of the client. Field, procedure, and trip blanks are analyzed upon request of the client. Reagent blanks are run daily on each instrument to check the contaminant level (Exhibit 19).

RE= REEXTRACTED

S.R.= PERCENT SURROGATE RECOVERY

ND= NOT DETECTED

P.Q.C.= PASS Q.C.

MN-COMP 0044893

B. MATRIX SPIKE AND SURROGATE ADDITIONS

Accuracy and matrix biases are monitored using spiked samples and where possible, surrogate additions. It is standard policy throughout the laboratory to prepare and analyze at least one matrix spike for each batch of 20 samples, for each matrix type within the batch, or as specified by state/project requirements.

Surrogate spiking compounds (if available), are added to and analyzed for, with every sample. A measured amount of spike/surrogate concentration is added to the sample before extraction of preparation. Surrogate spiking is utilized for GC and GC/MS analyses only.

C. DUPLICATE SAMPLE ANALYSIS

Precision is assessed by result comparison of a sample prepared and analyzed in duplicate. It is standard policy throughout the laboratory to prepare and analyze at least one duplicate sample for each batch of 20 samples and matrix type within the batch, or as specified by state/project requirements.

D. STANDARDS

The term standard shall apply to any analyte solution of known concentration which is traceable to a certified reference material. This includes calibration standards, spiking solutions, and laboratory control samples. Claims of traceability establishes the accuracy of measurements. Therefore, maintaining standard traceability is critical to the achievement of known and defensible data quality.

To establish traceability, all purchased reference materials (neat and stock solutions) are recorded into section-specific standard log books when received.

All entries and PACE standard labels contain a unique PACE ID number, date received, date opened, and expiration date. Log book entries also include the manufacturer's lot number, certified purity, and storage location. Subsequent preparations of stock, intermediate, and working solutions are also recorded in the standard log books. These entries must include all discrete measurements made during a preparation, parent materials, solvent used, and a PACE ID number.

Exhibit 20 illustrates a standard log book entry. Standard Operating Procedure for standards preparation contains further instructions for assigning unique ID numbers, proper syringe technique, shelf life of standards, and good laboratory practices.

Labeling: The standard vial should have a reference label (covered with cellophane tape) with the following information:

1 - Standard
2 - Name of Standard
3 - Prep. Date
4 - Prep. Personnel Initials
5 - Solvent

Certified reference standards from the EPA Repository are used for calibration or laboratory control standards in many organic analyses. Reference standards may also be purchased from approved commercial vendors. Currently approved vendors for organic reference standards are Ultra-Scientific, Supelco, Chem-Service, Inc., and Aldrich Chemical Company, Inc. Inorganic standards are purchased from major scientific supply companies (Fisher, American Scientific, and VWR). Certificates of analyses are requested with each purchase.

E. METHOD DETECTION LIMIT

The method detection limit (MDL) is defined as the minimum substance concentration that can be identified, measured and reported with 99% confidence that the analyte concentration is greater than zero. In general, the protocol described in Appendix B to 40CFR 136 (Federal Register, Vol. 49, No. 209, 10/26/84) is used to establish MDL's.

For GC/MS analyses and organochlorine pesticides by GC/EDC, the MDL has been determined according to EPA Contract Required Detection Limits (CRDL) as established for the Contract Laboratory Program. The MDL's for other organic analyses are set according to industry standards, client requirements, and instrument/method limitations. The MDL is validated using prepared standard solutions analyzed at detection limit concentrations.

The metals analyses MDL's correspond to instrument detection limits, and are established in the following manner: A standard solution of analyte in laboratory pure water with a concentration of 3-5 times the estimated instrument detection limit is analyzed seven consecutive times. The MDL is set at 3 times the standard deviation of the seven consecutive measurements.

GC Extraction

For general (wet) chemistry methods, the MDL is established using a calibration standard analyzed at doubled dilutions until it becomes impossible to distinguish an instrument response for the analyte. The MDL is set at the lowest observable standard concentration.

F. CONTROL CHARTS

Control charts monitor daily variations in precision and accuracy of routine analysis and detect variation trends. QC charts are constructed from performance data of the complete analytical method. Control chart construction requires initial data to establish the mean and range of measurements. Currently, spikes, spike duplicates, RPD's and external check sample values are charted.

G. LABORATORY CONTROL SAMPLES

EPA quality control check samples are analyzed at least once per week, and when new calibrations are performed. They provide a means of assessing the accuracy and precision of a measurement system's performance. Parameters of interest that initially fall outside of QC acceptance criteria are compared against a prepared EPA QC check sample. If laboratory performance for the parameter is found to be out of control, then necessary corrective actions are implemented.

MN-COMP 0044897

XII. PERFORMANCE AND SYSTEM AUDITS

A. PACE's INTERNAL SYSTEM AUDITS

1. All records, logs, and data files are routinely audited for completeness, accuracy, and adherence to standard operating procedures by an on-site auditing team. Audit team members generally include Corporate Vice-Presidents and Regional Directors. Several random project files are evaluated quarterly for compliance to procedure throughout the analytical process (i.e., from sample receipt through the final report). Supervisors, QC managers, and lab analysts routinely check all records for the same criteria.

2. System Audits:

   PACE is audited as required by regulatory agencies to maintain laboratory certifications, and by various commercial clients with laboratory auditing programs. These audits include audits by USEPA, USATHAMA, AIHA, and other appropriate federal, state and private agencies.

3. Performance Audits:

   a. USEPA Performance Evaluation Studies - PACE participates in the EPA semi-annual drinking water (WS Series) and semi-annual wastewater (WP Series) performance evaluation studies (four studies per year).

   b. PACE participates in various client sponsored performance evaluations by analyzing QC samples prepared and submitted by commercial clients in conjunction with their own QA program.

   c. Several government proficiency samples are analyzed annually to maintain various laboratory certifications (Exhibit 21).

   d. PACE regional offices are provided blind QC check samples quarterly.

4. Total Quality System Audit:

   The Corporate Quality Office performs a yearly on-site audit at each regional facility. Examples of the forms used as shown in Exhibit 22.

	2. Sample check-in documentation present in sample check-in area.								

MN-COMP 0044905

B. TRAINING AND TECHNICAL REVIEW

PACE considers competent, well-trained personnel to be a key to successful production of valid and reliable data. An extensive training and technical review program is in place at PACE, Inc. It includes:

1. Training Plans

The type and schedule of training required for each new or transferred employee is determined individually. A training plan is established to reflect individual and general training needs.

2. Training Classes

All sections conduct regularly scheduled training sessions specific to their needs.

Audio/visual training programs and open learning texts are available for use by all personnel.

Other laboratory QA and general training classes are offered periodically.

3. Technical Review Program

All employees are subject to technical reviews with their supervisor. The technical review assesses an individual's training progress and technical development and provides an opportunity to redirect the training plan accordingly to comprehensively cover further developmental needs. The schedule for technical reviews is:

a. New hire or transfer to new position/responsibilities: 6 months, 1 year.

b. After 1 year in same position/responsibilities: annually.

4. Support Programs

Attendance at outside seminars, classes, etc., is highly encouraged. PACE participates in many of these throughout the year. In-house seminars are presented by employees for employee bi-monthly meetings. Various topics are covered, including regulatory items and information from attendance at outside seminars. The PACE in-house library contains current periodicals and journals pertinent to the environmental industry and analytical chemistry, in addition to reference books, text books, and regulatory publications.

XIII. PREVENTIVE MAINTENANCE

PACE maintains service contracts for most major analytical equipment including all chromatography instruments, balances, atomic absorption, and inductively coupled plasma instruments. All instruments and equipment receive routine preventive maintenance, which is recorded in instrument specific maintenance logs. Routine maintenance insures that all equipment is operating under optimum conditions, reducing the possibility of instrument malfunction (consequently affecting sample results). An example of an instrument maintenance log is included (Exhibit 23).

MN-COMP 0044907

EXHIBIT 23

INSTRUMENT MAINTENANCE LOGBOOK FORM

INSTRUMENT I.D.:

DATE	MAINTENANCE ACTIVITY	NAME

XIV ASSESSMENT OF PRECISION, ACCURACY, COMPLETENESS REPRESENTATIVENESS, AND COMPARABILITY

The Quality Control Program at PACE uses precision and accuracy data to determine the acceptability of analytical results. Precision refers to result reproductibility and accuracy measures the degree of difference between observed and true values. One of every 20 analyses performed at PACE is run in duplicate (precision). Also, one of every 20 samples is spiked with a synthetic standard to assist in evaluating the accuracy of the method. Once 20 sets of precision or accuracy data have been obtained, a quality control chart is prepared. The Shewhart technique is the statistical method used to construct the charts. These quality control charts provide a quick visual means for monitoring the daily performance of the laboratory. Exhibits 24 and 25 contain examples of accuracy and precision charts along with their corresponding data sheets (Exhibits 26 and 27).

A. ACCURACY

The actual test result is compared to the theoretical result of 100% recovery and the percent recovery is calculated.

$$\% \text{ Recovery} = \frac{\text{Spiked Sample Result} - \text{Sample Result}}{\text{Spike Quantity}} \times 100$$

The percent recovery must fall within specific control limits for the results to be accepted and subsequent data validated. (See Table 2)

B. PRECISION

The results of the duplicate analyses are computed and the absolute relative percent difference (RPD) is calculated.

$$\text{RPD} = \frac{|\text{Sample Result} - \text{Duplicate Result}|}{\text{Average Result}} \times 100$$

The RPD must fall within set control limits for the results to be accepted and subsequent data validated. A one-sided distribution with zero as a target value is typical, given absolute value requirements (CLP).

C. WARNING LIMITS

Warning limits represent the 95% confidence interval and are equal to the mean value for the control sample, plus or minus two standard deviations ($\pm$ 2S). Exceeding these limits is a warning that the analytical system may be approaching an out-of-control situation, and should be inspected for possible sources of error before continuing the analysis. Analysts will inform the QC manager or the supervisor of such problems.

MN-COMP 0044913

D. CONTROL LIMITS

Control limits represent the 99% confidence interval and are equal to the mean value of the control sample, plus or minus three standard deviations (±3S). Exceeding these limits indicates that the analytical system is out-of-control. The QC manager or the supervisor shall be informed and corrective action shall be taken.

1. Method of Setting Limits

Control limits are established via statistical analysis, using QC sample results. Limits are determined for a parameter of each method as analyzed on a specific instrument.

The mean value (P) and the standard deviation (S) for each data set is calculated and the limits are set as:

Warning (WL) = P + 2S = 95% Confidence limit
Control (CL) = P + 3S = 99% Confidence limit

Where $P = \frac{X1 + X2 + X3.... Xn}{n}$ x = Sample result

and $S = \sqrt{\frac{\Sigma(X - P)^2}{n-1}}$ n = Total # of results in set
P = mean value

The minimum number of results to be used for statistical calculation (n) is 15-20. Limits will generally be calculated from a data point set every thirty days, depending on the method. Updated limits are issued at the beginning of every month.

2. Utilization of Acceptance Limits

QC sample results must fall within the established warning limits (P ± 2S) for each parameter.

Results that fall outside of warning limits, but remain within the control limits (P ± 3S), are considered suspect. These results must be carefully examined for possible sources of error in the analysis, or justified as a matrix bias effect. All such results are recorded in a Discrepancy Report form/Corrective Action form (See Section XV).

Any three consecutive results outside of warning limits but within control limits is an out-of-control event which shall be documented and corrected.

Results that fall outside of control limits (P ± 3S) must be documented and corrective action taken.

E. COMPLETENESS

Data completeness can be quantified during data assessment. It is expected that laboratories should provide data, meeting QC acceptance criteria, for 90% or more of the requested determinations. It is incumbent for planners to identify any sample types, such as control or background locations, which require 100% completeness.

F. REPRESENTATIVENESS

Representativeness is a qualitative element that is related to the ability to collect a sample that reflects the characteristics of that part of the environment that is to be assessed. Sample representativeness is dependent on the sampling techniques used and is considered individually for each project. It is specifically addressed in each work plan.

G. COMPARABILITY

Comparability is also considered during preparation of the work plan. The objective of comparability is to ensure that results of similar activities conducted by different parties are comparable. For example, the use of EPA-approved, etc., methods and procedures ensure comparability with other data from previous or following studies.

MN-COMP 0044915

XV. CORRECTIVE ACTION

If, as a result of audits or QC sample analyses, methods systems prove to be unsatisfactory, corrective action shall be implemented. The project manager, department manager, Quality Control manager, supervisor, and analyst may be involved in the corrective action. If previously reported data are affected by a situation requiring correction or if the corrective action impacts a project budget or schedule, the action will directly involve the project manager (and Quality Control manager).

For immediate or long-term corrective actions, steps comprising a closed-loop corrective action system are as follows:

1. Define the problem.

2. Assign responsibilities for problem investigation.

3. Investigate and determine the cause of the problem.

   a. Check all calculations

   b. Re-analyze the sample

   c. Verify the integrity of the spiking solution, laboratory control sample, or calibration standard.

   d. Check instrument and operating conditions to preclude the possibility of malfunctions or operator error.

4. Determine the corrective action(s) necessary to eliminate the problem.

5. Assign and accept responsibilities for implementing the corrective action.

6. Establish the effectiveness of the corrective action and implement the correction.

7. Verify and document that the corrective action has eliminated the problem (Exhibit #28).

   Depending upon the nature of a problem, the corrective action implemented may be formal or informal. In either case, occurrence of the problem, the corrective action employed, and verification that the problem has been eliminated must be documented.

   In addition, if the corrective action mandates the preparation of a new standard or calibration solution(s), a comparison study between the new solution versus the old solution will be performed. The results are supplied with the weekly QC submittal as verification of problem elimination.

XVI. QUALITY ASSURANCE REPORTS TO MANAGEMENT

A. OBJECTIVE

This section describes the methods used by PACE to store and retrieve quality assurance records and issue of appropriate reports.

B. REQUIREMENTS

Comprehensive records shall be maintained to provide evidence of the quality assurance activities. All charted QC values which indicate an out-of-control situation must be evaluated and explained. Any corrective actions and re-analysis of samples must be fully explained and documented.

C. IMPLEMENTATION

Procedures for recording all aspects of the Quality Assurance Program are written and filed.

D. REPORTS TO MANAGEMENT

Quarterly reports are provided by the Quality Control officer to the President, Vice President of Quality and Regional Director. This report addresses the quarterly quality assurance activities including details of corrective actions implemented, audit results, and QC summary information.

Subject:
Tunnel Survey Report, Collapse Area with Buried Drums – Feature 150
Ford Twin Cities Assembly Plant, St. Paul, Minnesota
MPCA VIC Project Number VP23530
MPCA PBP Project Number PB3682

Dear Ms. Schmitt and Ms. Hendry-Van Patten:

On behalf of Ford Motor Company (Ford), ARCADIS has prepared this brief summary report describing the tunnel survey for the Collapse Area with Buried Drums – Feature 150 for the Twin Cities Assembly Plant (Site) in St. Paul, Minnesota. This survey work was completed in accordance with the requirements of the Minnesota Pollution Control Agency (MPCA) Voluntary Investigation and Cleanup (VIC) Program and Petroleum Brownfields Program (PBP). The work was completed in accordance with discussions involving the MPCA.

Property Location and Description

The Site is located at 966 South Mississippi River Boulevard in St. Paul, Ramsey County, Minnesota at the approximate easting coordinate 484562.5 meters (m) and northing coordinate 4973822.5m. The Site is located in a mixed industrial, commercial, and residential use area on the eastern shore of the Mississippi River, along the east side of South Mississippi River Boulevard, south of Ford Parkway, and west of South Cleveland Avenue in St. Paul, Minnesota (see Figure 1). A network of tunnels underlies the site, and was described in the "*Phase I Environmental Site Assessment*" completed June 2007 by ARCADIS (Phase I).

Health and Safety

The survey of the tunnel was conducted according to the Health and Safety Plan (HASP) in accordance with Occupational Safety and Health Administration requirements as specified in the Code of Federal Regulations Title 29 Part 1910.120. The tunnels beneath the plant are a permitted confined space. All personnel that entered the tunnel were confined spaced trained prior to conducting the field work. Mid America Technical and Environmental Services of Maplewood, Minnesota provided the rescue teams for the work and the required permitting.

Survey of Feature 150 Collapse Area with Buried Drums

On October 3, 6 and 7, 2008 the tunnel leading to the Feature 150 was surveyed by Sunde Land Surveying (Sunde) of Bloomington, Minnesota. The tunnel location was surveyed to Ramsey County coordinate system [North American Datum of 1983 (NAD83)] and the elevation to vertical datum National Geodetic Vertical Datum of 1929 (NGVD 29). The location of the tunnel along with it terminus are presented on Figure 2.

The base of Feature 150 is located at an elevation of 711.0 feet mean sea level (MSL). The ground surface above the terminus of the tunnel is at an elevation of 772.9 feet MSL. The distance from the ground surface to the ceiling of the tunnel is approximately 56.7 feet. The end of the tunnel is located directly below the northeast corner of historical Disposal Area C, beneath the concrete parking area. A profile view of the terminus of the tunnel provided by Sunde is presented as Appendix A. Photographs of the tunnel and the location are presented in Appendix B.

Based on the location of the tunnel it is believed that the material encountered at the terminus is the consistent with material disposed of in the historical Disposal Area C. The description of the materials placed in Area C is consistent with the materials found at the end of the tunnel. As described in the Phase I the material at the terminus of the tunnel is concrete, wood chunks and paint sludge. Thus it is believed that the tunnel terminus has been filled from Disposal Area C materials and not a collapse of the tunnel.

Closing

Upon the closure of the TCAP the Feature 150 will be further evaluated. We appreciate your assistance with this project. If you have questions or need additional information, please call Bryan Zinda of ARCADIS at your convenience.

Sincerely,

ARCADIS

Bryan Zinda, PE

Subject:
Remedial Action Plan, 1A Tunnel Barrier Wall, Feature 150
Ford Twin Cities Assembly Plant, St. Paul, Minnesota
MPCA VIC Project Number VP23530
MPCA PBP Project Number PB3682

Dear Ms. Schmitt and Ms. Hendry-Van Patten:

On behalf of Ford Motor Company (Ford), ARCADIS has prepared this Remedial Action Plan (RAP) for the 1A Tunnel to prevent direct contact with waste materials present near the terminus of the tunnel for the Twin Cities Assembly Plant (Site) in St. Paul, Minnesota. The Site location is depicted on Figure 1.

Background Information

The area referred to as Feature 150 at the Ford Twin Cities Assembly Plant is an accumulation of materials on the far southern end of the 1A Tunnel. On October 3, 6, and 7, 2008 the 1A Tunnel leading to Feature 150 was surveyed by Sunde Land Surveying (Sunde) of Bloomington, Minnesota. The tunnel location was surveyed to Ramsey County coordinate system [North American Datum of 1983 (NAD83)] and the elevation to vertical datum National Geodetic Vertical Datum of 1929 (NGVD 29). The location and extent of the tunnel are presented on Figure 2.

The base of Feature 150 is located at an elevation of 711.0 feet above mean sea level (MSL). The ground surface above Feature 150 is at an elevation of 772.9 feet above MSL and the distance from the ground surface to the ceiling of the tunnel is approximately 56.7 feet. Feature 150 is located directly below the northeast corner of historical Disposal Area C. Historical Disposal Area C is now a concrete parking area.

Response Action

The MPCA requested a plan for the installation of a barrier wall in the 1A Tunnel to isolate the impacted area within the tunnel at Feature 150 in a letter dated October 16, 2009. The barrier wall will be installed near the terminus of the 1A tunnel just east of the waste material. The barrier wall, in combination with the locks at the entrance of the tunnels will be sufficient to prevent direct contact with the waste materials.

The barrier will be constructed at a point in the tunnel which is several thousand feet away from the entry portal of the tunnel. Since all materials will have to be hand-carried into position, the design theme for the work is to use materials that are readily available, relatively lightweight, and easy to construct.

Unistrut framing is a strong proven product, is relatively lightweight and has pre-engineered connectors. The Unistrut will be used for the main skeletal framing with a chain-link fence fabric attached for additional security. The barrio wall detail is presented in Figure 3. The Unistrut framing will be secured to the tunnel walls by drilling into the sandstone rock and anchoring with a sand/cement grout.

The general construction sequence will be as follows:

1. Bore 3-inch diameter holes in the tunnel floor to set the bottom portion of the P2000 Unistrut posts (shown below).

2. Bore matching holes in the tunnel ceiling for the upper portion of the posts to be installed.

3. Splice the upper and lower sections together with the P9200 tubing (shown below) and bolt in place.

4. Splice the horizontal sections together with the P9200 tubing (shown below) and bolt in place.

5. Install the horizontal Unistrut sections to the vertical sections using the P1045 connectors (shown below).

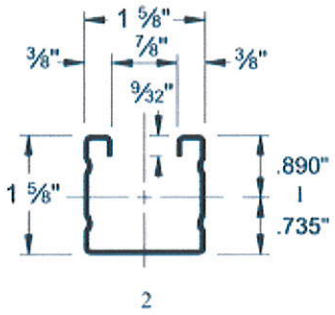
6. Attach the chain link fabric to the framing.

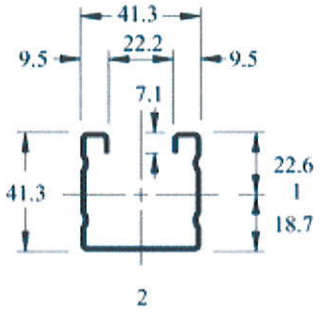
7. Mix sand/cement grout in approximate 2:1 proportions with water and fill the drilled holes in the tunnel floor with the grout mix.

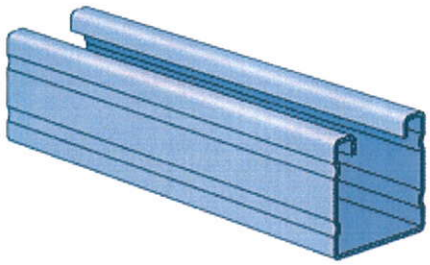
8. Allow grout mix to cure before installing the chain link fabric (approximately 24 hours).

Unistrut Components

P2000 - 1-5/8" x 1-5/8", 16 Gauge, Solid



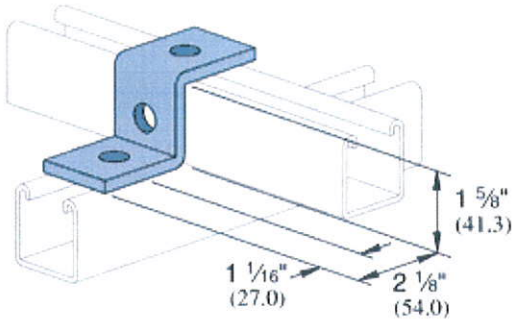




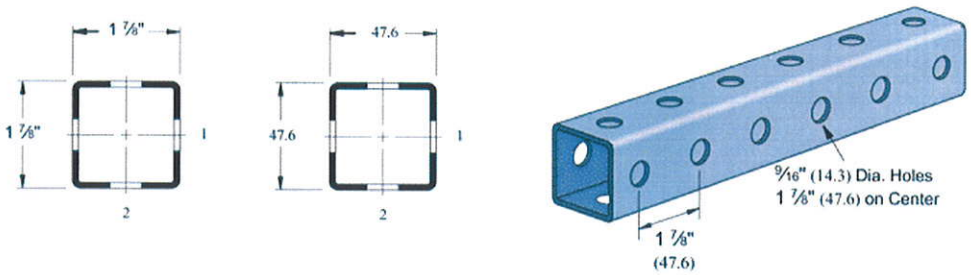
P1045 - Z Shape Fitting

Standard Dimensions:

- Hole Diameter: 9/16" (14.3mm)
- Hole Spacing (From End): 13/16" (20.6mm)
- Width: 1-5/8" (41mm)
- Thickness: 1/4" (6.4mm)



P9200 - 1 7/8" x 1 7/8" Telestrut Tubing



Schedule

Installation of the barrier wall will commence within two months of approval of the RAP by MPCA.

Closing

We appreciate the MPCA's understanding in this matter and look forward to receipt of your approval. If you have questions or need additional information, please call Bryan Zinda of ARCADIS at 612.373.0234 at your convenience.

Sincerely,

ARCADIS

Subject:
Response Action Implementation Report, 1A Tunnel Barrier Wall, Feature 150
Ford Twin Cities Assembly Plant, St. Paul, Minnesota
MPCA VIC Project Number VP23530
MPCA PBP Project Number PB3682

Dear Ms. Schmitt and Ms. Hendry-Van Patten:

On behalf of Ford Motor Company (Ford), ARCADIS has prepared this Response Action Implementation Report (RAIR) for the 1A Tunnel to prevent direct contact with waste materials present near the terminus of the tunnel for the Twin Cities Assembly Plant (Site) in St. Paul, Minnesota. The Site location and property layout are depicted on Figure 1.

Background Information

The area referred to as Feature 150 at the Ford Twin Cities Assembly Plant is an accumulation of materials on the far southern end of the 1A Tunnel. On October 3, 6, and 7, 2008 the 1A Tunnel leading to Feature 150 was surveyed by Sunde Land Surveying (Sunde) of Bloomington, Minnesota. The tunnel location was surveyed to Ramsey County coordinate system [North American Datum of 1983 (NAD83)] and the elevation to vertical datum National Geodetic Vertical Datum of 1929 (NGVD 29). The location and extent of the tunnel are presented on Figure 2.

The base of Feature 150 is located at an elevation of 711.0 feet above mean sea level (MSL). The ground surface above Feature 150 is at an elevation of 772.9 feet above MSL and the distance from the ground surface to the ceiling of the tunnel is approximately 56.7 feet. Feature 150 is located directly below the northeast corner of historical Disposal Area C. Historical Disposal Area C is now a concrete parking area.

Remedial Action

A Remedial Action Plan (RAP) was submitted to the MPCA on December 14, 2009 and approved by the MPCA on February 24, 2010. The remedial action consisted of the installation of a barrier wall in the 1A Tunnel (Feature 150) to isolate the impacted area. The barrier wall was installed near the terminus of the 1A Tunnel just east of the waste material. Work was conducted on December 10, 2010 and December 13 through 15, 2010.

The barrier was constructed at Feature 150, which is several thousand feet away from the entry portal of the tunnel. All materials were hand-carried into position via a permit-required confined pace entry. Unistrut framing was utilized since it is a strong proven product, is relatively lightweight and has pre-engineered connectors. The Unistrut was used for the main skeletal framing with a chain-link fence fabric attached for additional security. The Unistrut framing was secured to the tunnel walls by drilling and anchoring into the concrete formed wall.

The general construction consisted of the following:

1. Install chain link fabric in place using existing rebar from the concrete formed wall.

2. Core into the concrete formed wall; install anchor bolts through the Unistrut and into the concrete.

3. Splice the upper and middle horizontal Unistrut sections together with the P9200 tubing and bolt in place.

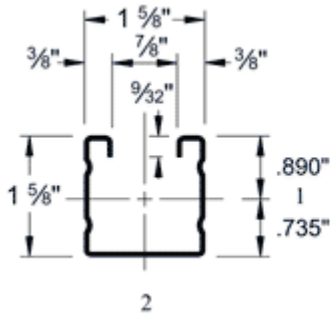
4. Fasten the vertical Unistrut sections to the horizontal sections.

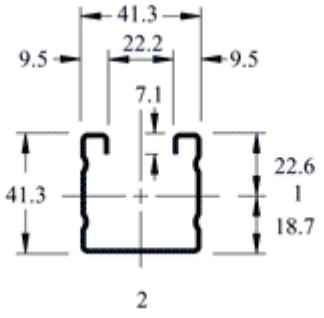
5. Tie the chain link fabric to the Unistrut framing.

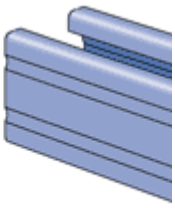
Photos of the barrier are shown on Figures 3, 4 and 5

Unistrut Components

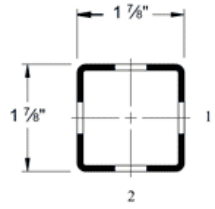
P2000 - 1-5/8" x 1-5/8", 16 Gauge, Solid

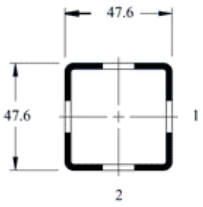


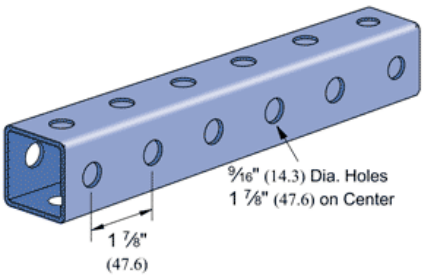




P9200 - 1 7/8" x 1 7/8" Telestrut Tubing







Summary

The installed barrier wall, in combination with the locks at the entrance of the tunnels is sufficient to prevent direct contact with the waste materials located at the terminal end of the 1A Tunnel and by installing the barrier wall, Ford has fulfilled is obligation of preventing direct contact with the waste materials present.

If you have questions or need additional information, please call Bryan Zinda of ARCADIS at 612.373.0234 at your convenience.

Sincerely,

RETURN RECEIPT REQUESTED

April 9, 1990

Mr. Jerry Amber
Ford Motor Company
Environmental Control Office
Commerce Park North
15201 Century Drive, Suite 608
Dearborn, Michigan 48120

Dear Mr. Amber:

RE: Ford Motor Company-Twin Cities Assembly Plant

This letter is notification that the Minnesota Pollution Control Agency (MPCA) staff intends to recommend that the MPCA Board issue a Request for Response Action (RFRA) for the purpose of a Remedial Investigation and a Feasibility Study/Remedial Design and Response Actions to Ford Motor Company (Ford) for the Ford-Twin Cities Assembly Plant (Site) located at 966 South Mississippi River Boulevard, St. Paul, Minnesota. Ford has been identified by the MPCA staff as the Responsible Person (RP) under Minn. Stat. § 115B.03 for the release of hazardous substances from the Site. The detailed facts which have led MPCA staff to identify Ford as the RP, together with other pertinent statutory information, are found in the Site history provided in the enclosure to this letter.

All hazardous waste sites in the state of Minnesota are ranked by priority to target MPCA efforts most effectively. The ranking is done in accordance with criteria prescribed by the U.S. Environmental Protection Agency (EPA), called the Hazard Ranking Score (HRS) system. Following the scoring, the site may be included in the Minnesota Permanent List of Priorities (PLP) and/or included in the National Priorities List (NPL). The Site has been listed on the PLP, with a HRS score of 8.

The authority for the MPCA to issue the RFRA is found in Minn. Stat. §§ 115B.17 and 115B.18. The RFRA is a statutorily mandated MPCA request that a RP conduct an investigation of contamination, examine alternative response actions and conduct response actions at a specific site, following appropriate procedures. Should the RP choose not to undertake the required investigations and/or response actions, the statutes allow the MPCA to undertake these cleanup steps and recover the expenses incurred or request the Attorney General to bring a lawsuit to compel performance of the RFRA activities.

MN-COMP 0052288

The same statute imposes five determinations the MPCA Board must make before issuing RFRAs. The determinations are:

1. A facility exists or has been identified to have existed;

2. A release or threatened release has been identified;

3. The release or threatened release is or was from the identified facility;

4. The release or threatened release is or was of a hazardous substance and/or a pollutant or contaminant; and,

5. The person(s), to whom the RFRA is to be directed, is a RP.

Based on these five determinations, MPCA staff believes that sufficient evidence exists to support its decision to recommend that the MPCA Board issue a RFRA to Ford. The RFRA is expected to be presented to the MPCA Board at their May 22, 1990, Board meeting.

Should you feel that you have information you wish to have considered in the RFRA or Site history, please submit this information to the Project Manager within thirty (30) days of the date of this letter. Except in limited circumstances (e.g., new analytical data is generated or new information is obtained from record searches or depositions which indicates you may not be a responsible party) information provided after thirty (30) days of the date of this letter will not be considered for inclusion in the preparation of the RFRA and it is unlikely that the MPCA Board will consider that information at its May 22, 1990, meeting. Enclosed is a draft copy of the Site history.

The MPCA staff, in addition to soliciting any information you feel would be relevant to issuance of a RFRA, is hereby soliciting your preference to enter into or not to enter into negotiations of a Consent Order. A Consent Order is a negotiated contract between the MPCA and the Responsible Party. The Consent Order specifies the activities to be undertaken to clean up a site, specifies the order in which cleanup activities will occur and specifies the schedule for the cleanup activities. The MPCA staff will present your preference to the MPCA Board and if you indicate a preference to enter into Consent Order negotiations, a Consent Order negotiation period will be specified in the RFRA that the MPCA staff recommends to the MPCA Board.

Your written preference to either enter into or not to enter into Consent Order negotiations should also be submitted to the Project Manager within 30 days of the date of this letter.

For comments or questions on this letter or the proposed RFRA, please contact Mr. Todd Goeks, Project Manager, of my staff at (612) 296-7710.

Sincerely,

Gerald L. Willet

Enclosure

SITE HISTORY

In October 1980, the MPCA staff received a complaint reporting past waste disposal at the Ford Motor Company (Ford)-Twin Cities Assembly Plant Site (Site), located at 966 South Mississippi River Boulevard, St. Paul, Ramsey County, Minnesota. The complainant stated that, during the 1950's, Ford had dumped waste solvents and barreled paint wastes over the river bluff west of the assembly plant. The MPCA staff requested that Ford investigate and report on the company's past waste management practices.

In responses to the information request, Ford stated that unknown quantities of waste paint solvents and sludges had been disposed on-site during a period from early plant operation until approximately 1965.

In addition to the disposal area located over and along the base of the bluff west of Mississippi River Boulevard (Site C), Ford identified the locations of three other historical disposal areas. The first additional dump was located southeast of the main assembly plant. Used solvents and oils were burned and factory wastes were buried at this location during early years of plant operations. No information regarding waste quantities or years of operation was available for this dump. Reportedly, assembly plant engineering records indicate that during a 1962 parking lot expansion, materials from this area were excavated and relocated to Site C.

Another disposal area was located at the south end of an old test track located east of the assembly plant. Waste paint sludges and solvents were disposed of in this area during a period from 1943 to approximately 1960. Materials were reportedly excavated from this disposal area in 1966 during an expansion of the railroad "tri-level" car loading yard. Excavated materials were placed at Site C.

The third additional disposal area identified by Ford was located north of the steam plant. All waste materials from this location were excavated and transported to a permitted disposal facility in 1983. This excavation was conducted to facilitate construction of a wastewater treatment plant.

In addition to the excavated materials and wastes relocated from other dumps to Site C, waste paint solvents and sludges generated by the assembly plant continued to be disposed at Site C until approximately 1965. Site C received large quantities of demolition rubble and excavated soil generated during 1984 to 1986 from construction of the Ranger paint plant at the old test track location. Much of the past waste dump is now located under 30 feet of debris fill. Presently, a major portion of the filled area at Site C is paved with eight inches of concrete and is being used as a parking lot for truck trailers.

Ford has been in operation at the Site since 1915. Activities at the Site have included: auto glass manufacturing, automobile manufacturing, and automobile assembly and painting. Initially the plant was used exclusively for auto glass production. Later, the western half of the plant housed Model T manufacturing and painting. Glass manufacturing operations ceased in 1958.

The Site, including all areas discussed above, has been owned by Ford since the early 1900's. At MPCA staff's request, Ford initiated a hydrogeological

investigation at Site C by installing a limited ground water monitoring program in December 1982 to determine whether wastes deposited at the Site had degraded ground water quality. Ground water samples collected and analyzed from Site C in 1982 indicated relatively low-level concentrations of contaminants including: 22 parts per billion (ppb) cis 1,2-dichloroethylene (DCE), 15 ppb trans 1,2-DCE, 59 ppb ethyl acetate, 5 ppb trichloroethylene (TCE), 2.1 ppb toluene, and 70 ppb tetrahydrofuran. Ground water analysis for metals indicated 20 ppb cadmium, 390 ppb chromium, and 220 ppb lead, each of which is above the Recommended Allowable Limit (RAL) for drinking water. Additional ground water samples collected and analyzed in 1989 indicated reduced levels of both metals and solvents; however, since two wells which were directly downgradient were abandoned prior to this sampling event, the samples collected were not completely representative of the ground water underlying the disposal site. Ford is presently conducting additional ground water investigations at Site C to accurately assess ground water quality underlying this disposal site.

At MPCA staff's request, Ford also initiated an investigation at the dump site located southeast of the main assembly plant in June 1989 to determine whether past waste management practices have impacted ground water quality. Soil and ground water samples were collected and analyzed, indicating the following maximum contaminant concentrations: 100,000 ppb ethyl benzene and 980 ppb total xylenes in soil; and 230 ppb methylene chloride, 43 ppb 1,1-DCE, 510 ppb benzene, and 3000 ppb ethyl benzene in ground water.

In October 1989, while investigating the possible sources of earlier reported releases, MPCA staff collected a ground water grab sample from an unlined sump adjacent to underground tanks used for waste solvent storage. Laboratory results indicated 13,000 ppb benzene, 1,920,000 ppb methylisobutyl ketone (MIBK), 16,000 ppb toluene, and 210,000 ppb ethyl benzene. The wastes stored in the tanks include: xylene, toluene, MIBK, methyl ethyl ketone, and small amounts of unspecified solvents.

The MPCA staff believes that the five determinations required before the MPCA can issue a RFRA have been met as follows:

1. The Site is a facility because hazardous substances were stored, deposited, disposed of, or placed at the Site. Waste solvents, including toluene, xylene, methyl ethyl ketone (MEK), and MIBK were stored and unknown quantities of unspecified waste paint solvents and sludges were disposed of at the Site. The Site is also a facility because it contains buildings, pipes or pipelines, storage containers, and landfills.

2. A release or threatened release of hazardous substances has been identified. MPCA staff has identified, through Ford's responses to information requests, that a release of hazardous substances occurred when waste paint solvents and sludges were disposed of at the Site. Releases of hazardous substances have also been identified by analysis of soil and ground water samples collected at the Site which revealed the presence of ethyl benzene and xylene in soil, and ethyl benzene, toluene, methylene chloride, benzene, cis 1,2-DCE, trans 1,2-DCE, 1,1-DCE, ethyl acetate, TCE, tetrahydrofuran, and MIBK in ground water.

3. The release or threatened release of hazardous substances is from the facility. Soil and ground water samples collected at the Site reveal the

presence of ethyl benzene and xylene in soil, and ethyl benzene, toluene, methylene chloride, benzene, cis 1,2-DCE, trans 1,2-DCE, 1,1-DCE, ethyl acetate, TCE, tetrahydrofuran, and MIBK in ground water.

4. The releases or threatened releases are hazardous substances. Toluene, ethyl benzene, methylene chloride, benzene, cis 1,2-DCE, trans 1,2-DCE, 1,1-DCE, ethyl acetate, TCE, tetrahydrofuran, xylene, and MIBK are hazardous substances because they are listed as hazardous wastes pursuant to 40 CFR 261.33 or Minn. Rules pt. 7045.0135, subp. 4.F.

5. Ford is a responsible person because it owned and operated the facility when the hazardous substances were placed or came to be located in or on the facility and during the time of the release or threatened release. Ford is also a responsible person because it owns the Site property and engaged in the business of generating, storing, and disposing of hazardous substances at the Site.

Dear Mr. Harms:
Enclosed are the analytical results for sample(s) received by the laboratory on November 14, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mariah Peronto

ANALYTICAL RESULTS

Project: 11A-1311-C Ford
Pace Project No.: 10175662

Sample: Drum 2 **Lab ID: 10175662002** Collected: 11/11/11 10:49 Received: 11/14/11 11:53 Matrix: Solid

Results reported on a "dry-weight" basis

QUALIFIERS

Project: 11A-1311-C Ford
Pace Project No.: 10175662

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
CL	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased low.
D6	The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: 11A-1311-C2 Ford
Pace Project No.: 10182983

Dear Mr. Harms:
Enclosed are the analytical results for sample(s) received by the laboratory on February 14, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Mariah Peronto

QUALIFIERS

Project: 11A-1311-C2 Ford
Pace Project No.: 10182983

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

ANALYTE QUALIFIERS

1M	The sample was received at the laboratory outside of the method recommended 48 hour holding time from collection to preservation.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
D6	The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.

denise.pohl@testamericainc.com
06/30/2015

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-52076-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/17/2015 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 3.0º C, 4.0º C, 4.2º C and 4.6º C.

TCLP VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for TCLP volatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 06/21/2015 and analyzed on 06/22/2015 and 06/23/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7), ASB-1002_60-64 (20150616) (240-52076-8) and MB-01 (20150616) (240-52076-9) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 06/18/2015 and analyzed on 06/22/2015 and 06/23/2015.

1,2-Dichloroethane-d4 (Surr), 4-Bromofluorobenzene (Surr), Dibromofluoromethane (Surr) and Toluene-d8 (Surr) failed the surrogate recovery criteria high for ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), and ASB-1002_60-64 (20150616) (240-52076-8).

1,2-Dichloroethane-d4 (Surr) failed the surrogate recovery criteria high for ASB-1002_55-60 (20150616) (240-52076-7). Refer to the QC report for details.

Samples ASB-1001_65-70 (20150615) (240-52076-3)[50X], ASB-1001_72-74 (20150615) (240-52076-4)[100X], ASB-1001_80-82 (20150615) (240-52076-6)[1.43X], ASB-1002_55-60 (20150616) (240-52076-7)[20X] and ASB-1002_60-64 (20150616) (240-52076-8) [100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 240-185697 and analytical batch 240-186116 on these samples: ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), and MB-01 (20150616) (240-52076-9).

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 240-185697 and analytical batch 240-186326 on these samples: ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for TCLP semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8270C. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/26/2015 and 06/27/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/18/2015 and analyzed on 06/23/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

2,4,6-Tribromophenol (Surr), 2-Fluorobiphenyl (Surr), 2-Fluorophenol (Surr), Nitrobenzene-d5 (Surr), Phenol-d5 (Surr) and Terphenyl-d14 (Surr) failed the surrogate recovery criteria low for ASB-1001_65-70 (20150615) (240-52076-3) and ASB-1001_72-74 (20150615) (240-52076-4).

Nitrobenzene-d5 (Surr) failed the surrogate recovery criteria low for ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8).

Phenol-d5 (Surr) failed the surrogate recovery criteria high for ASB-1002_55-60 (20150616) (240-52076-7). Refer to the QC report for details.

Samples ASB-1001_65-70 (20150615) (240-52076-3)[200X], ASB-1001_72-74 (20150615) (240-52076-4)[200X], ASB-1001_80-82 (20150615) (240-52076-6)[2.5X], ASB-1002_55-60 (20150616) (240-52076-7)[50X] and ASB-1002_60-64 (20150616) (240-52076-8) [50X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8270C: The following samples was diluted due to the nature of the sample matrix: ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_80-82 (20150615) (240-52076-6), and ASB-1002_60-64 (20150616) (240-52076-8). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7), ASB-1002_60-64 (20150616) (240-52076-8) and MB-01 (20150616) (240-52076-9) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were prepared on 06/22/2015 and analyzed on 06/23/2015.

Samples ASB-1001_65-70 (20150615) (240-52076-3)[100X], ASB-1001_72-74 (20150615) (240-52076-4)[200X], ASB-1002_55-60 (20150616) (240-52076-7)[20X] and ASB-1002_60-64 (20150616) (240-52076-8)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) WI-GRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the Gasoline Range Organics (GRO) mix (i.e., Naphthalene): ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7), and ASB-1002_60-64 (20150616) (240-52076-8).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/18/2015 and analyzed on 06/23/2015.

WI Diesel Range Organics (C10-C28) was detected in method blank MB 240-185628/12-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Samples ASB-1001_65-70 (20150615) (240-52076-3)[200X], ASB-1001_72-74 (20150615) (240-52076-4)[500X], ASB-1002_55-60 (20150616) (240-52076-7)[200X] and ASB-1002_60-64 (20150616) (240-52076-8)[500X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) WI DRO PREP: Due to the matrix, the following samples could not be concentrated to the final method required volume: ASB-1001_72-74 (20150615) (240-52076-4) and ASB-1002_60-64 (20150616) (240-52076-8). The reporting limits (RLs) are elevated proportionately.

Method(s) WI DRO PREP: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-185628.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP METALS (ICP)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Methods 1311/6010B. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/24/2015.

Several analytes were detected in method blank LB 240-186216/1-B at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Copper, Nickel, Potassium and Zinc were detected in method blank MB 240-186308/2-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Manganese failed the recovery criteria high for the MS/MSD of sample 240-52076-1 in batch 240-186556. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL METALS (ICP)

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/18/2015 and analyzed on 06/19/2015 and 06/20/2015.

Potassium and Zinc were detected in method blank MB 240-185711/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Several analytes failed the recovery criteria high for the MS/MSD of sample 240-52076-1 in batch 240-185884.

Cadmium exceeded the RPD limit of sample 240-52076-1 in batch 240-185884.

Refer to the QC report for details.

Samples ASB-1001_72-74 (20150615) (240-52076-4)[5X] and ASB-1002_60-64 (20150616) (240-52076-8)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP MERCURY

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for total

mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 06/18/2015 and analyzed on 06/19/2015.

Sample ASB-1001_72-74 (20150615) (240-52076-4)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HEXAVALENT CHROMIUM

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 06/24/2015 and analyzed on 06/25/2015.

Samples ASB-1001_65-70 (20150615) (240-52076-3)[5X] and ASB-1001_72-74 (20150615) (240-52076-4)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 7196A: The following samples were diluted for hexavalent chromium due to the nature of the sample matrix: ASB-1001_65-70 (20150615) (240-52076-3) and ASB-1001_72-74 (20150615) (240-52076-4). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TRIVALENT CHROMIUM

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for trivalent chromium in accordance with EPA SW-846 Method 7196A_CR3. The samples were analyzed on 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS

Samples ASB-1001_65-70 (20150615) (240-52076-3), ASB-1001_72-74 (20150615) (240-52076-4), ASB-1001_80-82 (20150615) (240-52076-6), ASB-1002_55-60 (20150616) (240-52076-7) and ASB-1002_60-64 (20150616) (240-52076-8) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 06/18/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-52076-1

Lab Section	Qualifier	Description
GC/MS VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate is outside control limits
GC/MS Semi VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate is outside control limits
GC Semi VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Rob Ellis
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 52076-1
Sample date: 2015-06-15 2015-06-16
Report received by CADENA: 2015-06-30
Initial Data Verification completed by CADENA: 2015-07-01

The following minor QC exceptions or missing information were noted:

WI-GRO and WI-DRO QC batch did not include MS recovery data and surrogate recoveries were not available for samples or QC.

WI-DRO method blank had a detection below the RL. Qualification of client sample results was not required based on this method blank detection.

GCMS VOC QC batch 185697 and WI-DRO batch 185628 did not include MS recovery data due to insufficient sample volume available for creating MS/MSD?s according to laboratory submittal case narrative.

GCMS VOC and GCMS SVOC surrogate recoveries were diluted to below reliably quantifiable levels so were not used to qualify results for client samples -003, -004, -007 and -008.

GCMS SVOC QC batch MS recovery outliers were not determined using samples from this submittal so qualification of client sample results was not required based on these sample-specific QC outliers.

Metals method blanks had detections below the RL in QC batch 185711 for potassium and zinc and in QC batch 186308 for barium, chromium, copper, manganese, nickel, potassium, arsenic, lead and zinc. Metals results should be considered to be non-detect at the RL and qualified with UB flags for the following samples and analytes:
CHROMIUM - UB flags - -003, -004, -006 and-007.
COPPER - UB flags - -003, -004,-006, -007 and -008.
NICKEL - B flags (non-detect at the concentration reported) - -003, -004, -006, -007, -008.
POTASSIUM - UB flags - -006.
ARSENIC - UB flags - -003, -006, -007, -008.
ZINC - UB flags - -006.

Metals sample -001 solid matrix MS/MSD recoveries were outliers biased high for calcium and MS or MSD recovery but not both alone with the MS/MSD RPD were outliers with the recoveries biased high for cadmium. Client sample -001 solid matrix cadmium and calcium results should be considered to be estimated and qualified with J flags. Recoveries for aluminum, chromium, copper, iron and manganese were not considered to be statistically reliable so were not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule).

Metals sample -001 SPLP/TCLP matrix MS/MSD recoveries for aluminum, chromium, copper, iron and manganese were not considered to be statistically reliable so were not used to qualify results due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule). MS or MSD recoveries but not both were outliers biased high for magnesium and potassium so qualification was not required based on these QC outliers alone.

6 Solid sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other, Metals and General Chemistry parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-52076-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 6/17/2015 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 4 coolers at receipt time were 3.0º C, 4.0º C, 4.2º C and 4.6º C.

TCLP VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for TCLP volatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 06/21/2015 and analyzed on 06/22/2015.

Sample ASB-1001_39-42 (20150615) (240-52076-1)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: ASB-1001_39-42 (20150615) (240-52076-1). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 240-185697 and analytical batch 240-186116 on these samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) .

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 06/18/2015 and analyzed on 06/22/2015.

Sample ASB-1001_50-54 (20150615) (240-52076-2)[3.33X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for TCLP semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8270C. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/25/2015 and 06/26/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

2-Methylphenol and Pentachlorophenol failed the recovery criteria low for the MS of sample 240-52203-1 in batch 240-186705. Pyridine failed the recovery criteria high. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/18/2015 and analyzed on 06/23/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Samples ASB-1001_39-42 (20150615) (240-52076-1)[4X] and ASB-1001_50-54 (20150615) (240-52076-2)[2.5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8270C: The following sample was diluted due to the nature of the sample matrix: ASB-1001_39-42 (20150615) (240-52076-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were prepared on 06/22/2015 and analyzed on 06/23/2015.

Samples ASB-1001_39-42 (20150615) (240-52076-1)[2X] and ASB-1001_50-54 (20150615) (240-52076-2)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) WI-GRO: Significant peaks, readily distinguished from background, were detected in the following samples within five minutes after the end of the analytical window defined by the last component eluting in the Gasoline Range Organics (GRO) mix (i.e., Naphthalene): ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO

Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/18/2015 and analyzed on 06/22/2015 and 06/23/2015.

WI Diesel Range Organics (C10-C28) was detected in method blank MB 240-185628/12-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Samples ASB-1001_39-42 (20150615) (240-52076-1)[20X] and ASB-1001_50-54 (20150615) (240-52076-2)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) WI DRO PREP: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-185628.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP METALS (ICP)

Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Methods 1311/6010B. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/24/2015.

Several analytes were detected in method blank LB 240-186216/1-B at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Manganese failed the recovery criteria high for the MS/MSD of sample ASB-1001_39-42 (20150615)MS/MSD (240-52076-1) in batch 240-186556. Refer to the QC report for details.

Copper, Nickel, Potassium and Zinc were detected in method blank MB 240-186308/2-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL METALS (ICP)
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/18/2015 and analyzed on 06/19/2015 and 06/20/2015.

Potassium and Zinc were detected in method blank MB 240-185711/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Several analytes failed the recovery criteria low for the MS of sample ASB-1001_39-42 (20150615)MS (240-52076-1) in batch 240-186018. Aluminum, Calcium, Copper and Manganese failed the recovery criteria high. For the MSD of sample ASB-1001_39-42 (20150615)MSD (240-52076-1) in batch 240-186018, Chromium, Antimony and Lead failed the recovery criteria low. Several analytes failed the recovery criteria high. Also, Cadmium, Antimony and Lead exceeded the RPD limit. Refer to the QC report for details.

Samples ASB-1001_39-42 (20150615) (240-52076-1)[20X] and ASB-1001_50-54 (20150615) (240-52076-2)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP MERCURY
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The samples were leached on 06/22/2015, prepared on 06/23/2015 and analyzed on 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 06/18/2015 and analyzed on 06/19/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HEXAVALENT CHROMIUM
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 06/24/2015 and analyzed on 06/25/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TRIVALENT CHROMIUM
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for trivalent chromium in accordance with EPA SW-846 Method 7196A_CR3. The samples were analyzed on 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS
Samples ASB-1001_39-42 (20150615) (240-52076-1) and ASB-1001_50-54 (20150615) (240-52076-2) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 06/18/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc. Job Number: 240-52076-2

Lab Section	Qualifier	Description
GC/MS VOA		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	F1	MS and/or MSD Recovery is outside acceptance limits.
	4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	B	Compound was found in the blank and sample.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	F1	MS and/or MSD Recovery is outside acceptance limits.
	4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

July 23, 2015

Rob Ellis
ARCADIS
430 First Avenue North, Ste 720
Minneapolis, MN US 55401

CADENA project ID: E200572
Project: FORD-Twin Cities Assembly Plant
Project number: DE000372.0003
Laboratory: TestAmerica - North Canton
Laboratory submittal: 52076-2
Sample date: 2015-06-15
Report received by CADENA: 2015-07-22
Initial Data Verification completed by CADENA: 2015-07-23

The following minor QC exceptions or missing information were noted:

WI-GRO and WI-DRO sample results were not associated with surrogate recoveries and QC batch summaries did not include MS recovery data.

GCMS TCLP VOC QC batch did not include MS recovery data due to insufficient sample volume available according to the laboratory submittal case narrative.

WI-DRO blank had a detection below the RL. Qualification of client sample results was not required based on this method blank detection.

TCLP GCMS SVOC QC batch MS recovery outliers were not determined using samples from this submittal so qualification of client sample results was not required based on these sample-specific QC outliers.

Metals method blanks had detections below the RL for total potassium and zinc and TCLP barium, chromium, copper, manganese, nickel, potassium, arsenic, lead and zinc. Client samples -001 and -002 copper and arsenic results should be considered to be non-detect at the RL and qualified with UB flags.

Metals MS/MSD recoveries for sample -001 total metals analysis were diluted to below reliably quantifiable levels so were not used to qualify client sample results. Client sample -001 TCLP MS/MSD recoveries were not considered to be reliably due to elevated levels of target analyte in the original sample matrix relative to the amount spiked (4X rule) for antimony, barium, lead, zinc and manganese. Note: TCLP metals sample -001 MS/MSD was analyzed at two different dilutions.

2 Soil sample(s) were analyzed for GCMS VOC, GCMS SVOC, GC VOC, GC Other, Metals and General Chemistry parameter(s).

Sample/MS/MSD Surrogate Recovery, Blank/LCS Surrogate Recovery, LCS/LCD Recovery, MS/MSD Recovery, MS/MSD RPD, Blank Contamination and Hold Time Exception were reviewed as part of our verification.

Analytical results reported between RDL and MDL are flagged 'J' and considered estimated values.

Qualifiers added during verification have been added to the electronic data which is available for download from the CADENA CLMS. Refer to the attached table of analytical results that have been qualified during verification.

The definitions of the qualifiers used for this data package are defined in the analytical report. CADENA valid qualifiers are defined in the table below. To view and download a PDF copy of the laboratory analytical report access the CADENA CLMS at http://clms.cadenaco.com/index.cfm.

Data verification for the report specified above was completed using the Ford Motor Company Environmental Laboratory Technical Specification, the CADENA Standard Operating Procedure for the Verification of Environmental Analytical Data and the associated analytical methods as references for evaluating the batch QC, sample data and report content. The EPA National Functional Guidelines for validating organic and inorganic data were used as guidance when addressing out of control QC results and the associated data qualifiers.

Please contact me if you have any questions.

Sincerely,

Jim Tomalia

Project Scientist

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

SAMPLING AND ANALYSIS SUMMARY

CADENA Project ID: E200572
Laboratory: TestAmerica-North Canton
Laboratory Submittal: 52076-2

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: Ford TCAP - E200572

Report Number: 240-52152-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 6/18/2015 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 2.2º C, 4.2º C and 5.6º C.

TCLP VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for TCLP volatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8260B. The samples were leached on 06/22/2015 and 06/23/2015 and analyzed on 06/23/2015 and 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4), ASB-1003_70-74 (20150617) (240-52152-5) and MB-01 (20150617) (240-52152-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 06/19/2015 and analyzed on 06/22/2015, 06/23/2015, 06/24/2015 and 06/25/2015.

Toluene was detected in method blank MB 240-185863/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

1,2-Dichloroethane-d4 (Surr), 4-Bromofluorobenzene (Surr), Dibromofluoromethane (Surr) and Toluene-d8 (Surr) failed the surrogate recovery criteria high for ASB-1002_75-77 (20150616) (240-52152-1).

Dibromofluoromethane (Surr) failed the surrogate recovery criteria low for 240-52155-B-1-C MS and 240-52155-B-1-D MSD. Refer to the QC report for details.

Several analytes failed the recovery criteria low for the MS/MSD of sample 240-52155-1 in batch 240-186226.

Several analytes exceeded the RPD limit of sample 240-52155-1 in batch 240-186226.

Refer to the QC report for details.

Samples ASB-1002_75-77 (20150616) (240-52152-1)[166.67X] and ASB-1002_80-84 (20150616) (240-52152-2)[16.67X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 240-185863 and analytical batch 240-186116 on these samples: ASB-1003_70-74 (20150617) (240-52152-5) and MB-01 (20150617) (240-52152-6).

Method(s) 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 240-185863 and analytical batch 240-186326 on this sample: ASB-1003_60-64 (20150617) (240-52152-4).

Method(s) 8260B: A MS/MSD was prepared for batch 185863, but was analyzed in a different analytical batch: ASB-1002_75-77 (20150616) (240-52152-1) and ASB-1002_80-84 (20150616) (240-52152-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for TCLP semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Methods 1311/8270C. The samples were leached on 06/23/2015, prepared on 06/24/2015 and analyzed on 06/26/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 06/19/2015 and analyzed on 06/24/2015.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Bis(2-ethylhexyl) phthalate was detected in method blank MB 240-185853/11-A at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Di-n-butyl phthalate was detected in method blank MB 240-185853/11-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

2,4,6-Tribromophenol (Surr), 2-Fluorobiphenyl (Surr), 2-Fluorophenol (Surr), Nitrobenzene-d5 (Surr), Phenol-d5 (Surr) and Terphenyl-d14 (Surr) failed the surrogate recovery criteria low for ASB-1002_75-77 (20150616) (240-52152-1) and ASB-1002_80-84 (20150616) (240-52152-2). Refer to the QC report for details.

Samples ASB-1002_75-77 (20150616) (240-52152-1)[200X], ASB-1002_80-84 (20150616) (240-52152-2)[100X] and ASB-1003_70-74 (20150617) (240-52152-5)[4X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8270C: The continuing calibration verification (CCV) associated with batch 186512 recovered above the upper control limit for 2,4-Dinitrophenol. The samples associated with this CCV were non-detect for the affected analyte; therefore, the data have been reported. The following samples are impacted: ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4), and ASB-1003_70-74 (20150617) (240-52152-5).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN GRO

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4), ASB-1003_70-74 (20150617) (240-52152-5) and MB-01 (20150617) (240-52152-6) were analyzed for Wisconsin GRO in accordance with Wisconsin DNR Modified GRO. The samples were prepared on 06/23/2015 and analyzed on 06/24/2015 and 06/25/2015.

Samples ASB-1002_75-77 (20150616) (240-52152-1)[200X], ASB-1002_80-84 (20150616) (240-52152-2)[50X] and ASB-1002_92-95 (20150616) (240-52152-3)[100X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Sample ASB-1002_75-77 (20150616) (240-52152-1) was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 06/19/2015 and analyzed on 06/23/2015.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

Tetrachloro-m-xylene failed the surrogate recovery criteria low for ASB-1002_75-77 (20150616) (240-52152-1). DCB Decachlorobiphenyl failed the surrogate recovery criteria high. Refer to the QC report for details.

Aroclor-1260 failed the recovery criteria high for the MS/MSD of sample 240-52132-1 in batch 240-186236. Refer to the QC report for details.

Sample ASB-1002_75-77 (20150616) (240-52152-1)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 8082: The following sample required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: ASB-1002_75-77 (20150616) (240-52152-1). Reagents: 2055995, 1848564, and 1931921.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

WISCONSIN DRO
Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for Wisconsin DRO in accordance with Wisconsin DNR Modified DRO. The samples were prepared on 06/22/2015 and analyzed on 06/23/2015 and 06/24/2015.

Samples ASB-1002_75-77 (20150616) (240-52152-1)[400X], ASB-1002_80-84 (20150616) (240-52152-2)[40X], ASB-1003_60-64 (20150617) (240-52152-4)[5X] and ASB-1003_70-74 (20150617) (240-52152-5)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) WI DRO PREP: Due to the matrix, the following sample could not be concentrated to the final method required volume: ASB-1002_75-77 (20150616) (240-52152-1). The reporting limits (RLs) are elevated proportionately.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP METALS (ICP)
Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Methods 1311/6010B. The samples were leached on 06/23/2015, prepared on 06/24/2015 and analyzed on 06/25/2015 and 06/26/2015.

Several analytes were detected in method blank LB 240-186513/1-B at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Potassium was detected in method blank MB 240-186561/2-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Calcium, Iron, Zinc and Lead failed the recovery criteria low for the MS of sample ASB-1002_75-77 (20150616)MS (240-52152-1) in batch 240-186911. Zinc failed the recovery criteria low for the MSD of sample ASB-1002_75-77 (20150616)MSD (240-52152-1) in batch 240-186732. Refer to the QC report for details.

Sample ASB-1002_75-77 (20150616) (240-52152-1)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL METALS (ICP)
Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 06/19/2015 and analyzed on 06/20/2015, 06/23/2015 and 06/24/2015.

Chromium, Magnesium and Zinc were detected in method blank MB 240-185893/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a

result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Several analytes failed the recovery criteria low for the MS of sample ASB-1002_75-77 (20150616)MS (240-52152-1) in batch 240-186476. Aluminum, Calcium, Magnesium and Barium failed the recovery criteria high. For the MSD of sample ASB-1002_75-77 (20150616)MSD (240-52152-1) in batch 240-186476, Several analytes failed the recovery criteria low. Several analytes failed the recovery criteria high. Also, Several analytes exceeded the RPD limit. Refer to the QC report for details.

Sample ASB-1002_75-77 (20150616) (240-52152-1)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP MERCURY

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for TCLP mercury in accordance with EPA SW-846 Methods 1311/7470A. The samples were leached on 06/23/2015, prepared on 06/24/2015 and analyzed on 06/25/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for total mercury in accordance with EPA SW-846 Method 7471A. The samples were prepared on 06/19/2015 and analyzed on 06/22/2015.

Mercury failed the recovery criteria low for the MS/MSD of sample ASB-1002_75-77 (20150616)MS/MSD (240-52152-1) in batch 240-186138. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

HEXAVALENT CHROMIUM

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for hexavalent chromium in accordance with EPA SW-846 Method 3060A/7196A. The samples were prepared on 06/24/2015 and analyzed on 06/25/2015.

Samples ASB-1002_75-77 (20150616) (240-52152-1)[10X], ASB-1003_60-64 (20150617) (240-52152-4)[5X] and ASB-1003_70-74 (20150617) (240-52152-5)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Method(s) 7196A: The following samples were diluted for hexavalent chromium due to the nature of the sample matrix: ASB-1002_75-77 (20150616) (240-52152-1), ASB-1003_60-64 (20150617) (240-52152-4), and ASB-1003_70-74 (20150617) (240-52152-5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TRIVALENT CHROMIUM

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for trivalent chromium in accordance with EPA SW-846 Method 7196A_CR3. The samples were analyzed on 06/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS

Samples ASB-1002_75-77 (20150616) (240-52152-1), ASB-1002_80-84 (20150616) (240-52152-2), ASB-1002_92-95 (20150616) (240-52152-3), ASB-1003_60-64 (20150617) (240-52152-4) and ASB-1003_70-74 (20150617) (240-52152-5) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 06/19/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
